Über dieses Buch

Dies ist ein digitales Exemplar eines Buches, das seit Generationen in den Regalen der Bibliotheken aufbewahrt wurde, bevor es von Google im Rahmen eines Projekts, mit dem die Bücher dieser Welt online verfügbar gemacht werden sollen, sorgfältig gescannt wurde.

Das Buch hat das Urheberrecht überdauert und kann nun öffentlich zugänglich gemacht werden. Ein öffentlich zugängliches Buch ist ein Buch, das niemals Urheberrechten unterlag oder bei dem die Schutzfrist des Urheberrechts abgelaufen ist. Ob ein Buch öffentlich zugänglich ist, kann von Land zu Land unterschiedlich sein. Öffentlich zugängliche Bücher sind unser Tor zur Vergangenheit und stellen ein geschichtliches, kulturelles und wissenschaftliches Vermögen dar, das häufig nur schwierig zu entdecken ist.

Gebrauchsspuren, Anmerkungen und andere Randbemerkungen, die im Originalband enthalten sind, finden sich auch in dieser Datei – eine Erinnerung an die lange Reise, die das Buch vom Verleger zu einer Bibliothek und weiter zu Ihnen hinter sich gebracht hat.

Nutzungsrichtlinien

Google ist stolz, mit Bibliotheken in partnerschaftlicher Zusammenarbeit öffentlich zugängliches Material zu digitalisieren und einer breiten Masse zugänglich zu machen. Öffentlich zugängliche Bücher gehören der Öffentlichkeit, und wir sind nur ihre Hüter. Nichtsdestotrotz ist diese Arbeit kostspielig. Um diese Ressource weiterhin zur Verfügung stellen zu können, haben wir Schritte unternommen, um den Missbrauch durch kommerzielle Parteien zu verhindern. Dazu gehören technische Einschränkungen für automatisierte Abfragen.

Wir bitten Sie um Einhaltung folgender Richtlinien:

+ *Nutzung der Dateien zu nichtkommerziellen Zwecken* Wir haben Google Buchsuche für Endanwender konzipiert und möchten, dass Sie diese Dateien nur für persönliche, nichtkommerzielle Zwecke verwenden.
+ *Keine automatisierten Abfragen* Senden Sie keine automatisierten Abfragen irgendwelcher Art an das Google-System. Wenn Sie Recherchen über maschinelle Übersetzung, optische Zeichenerkennung oder andere Bereiche durchführen, in denen der Zugang zu Text in großen Mengen nützlich ist, wenden Sie sich bitte an uns. Wir fördern die Nutzung des öffentlich zugänglichen Materials für diese Zwecke und können Ihnen unter Umständen helfen.
+ *Beibehaltung von Google-Markenelementen* Das "Wasserzeichen" von Google, das Sie in jeder Datei finden, ist wichtig zur Information über dieses Projekt und hilft den Anwendern weiteres Material über Google Buchsuche zu finden. Bitte entfernen Sie das Wasserzeichen nicht.
+ *Bewegen Sie sich innerhalb der Legalität* Unabhängig von Ihrem Verwendungszweck müssen Sie sich Ihrer Verantwortung bewusst sein, sicherzustellen, dass Ihre Nutzung legal ist. Gehen Sie nicht davon aus, dass ein Buch, das nach unserem Dafürhalten für Nutzer in den USA öffentlich zugänglich ist, auch für Nutzer in anderen Ländern öffentlich zugänglich ist. Ob ein Buch noch dem Urheberrecht unterliegt, ist von Land zu Land verschieden. Wir können keine Beratung leisten, ob eine bestimmte Nutzung eines bestimmten Buches gesetzlich zulässig ist. Gehen Sie nicht davon aus, dass das Erscheinen eines Buchs in Google Buchsuche bedeutet, dass es in jeder Form und überall auf der Welt verwendet werden kann. Eine Urheberrechtsverletzung kann schwerwiegende Folgen haben.

Über Google Buchsuche

Das Ziel von Google besteht darin, die weltweiten Informationen zu organisieren und allgemein nutzbar und zugänglich zu machen. Google Buchsuche hilft Lesern dabei, die Bücher dieser Welt zu entdecken, und unterstützt Autoren und Verleger dabei, neue Zielgruppen zu erreichen. Den gesamten Buchtext können Sie im Internet unter `http://books.google.com` durchsuchen.

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

INDEX

Fifty-Eighth Volume

RAILWAY WORLD

January to December, 1914

A

- Accidents :—
  - Contributory Negligence in Railway 463
  - Recording and Classifying Railway 803
  - Telegraphic Reports on 673
- Act, A Significant 865
- Actions for Personal Injuries 930
- Adaptability of the Electric Locomotive to Railroad Switching Service 477
- Aeronautical Congress, Sixth World's 578
- Africa, The Railroad Conquest in 542
- Agricultural Department Experiments With Poultry Cars 452
- Alaska :—
  - Government by Development Board 490
  - The Government's Railway Venture 171
  - Railway Construction in 674
- American Association of Railroad Superintendents 491, 579
  - Forthcoming Meeting of the 673
- American Association of Traveling Passenger Agents, Resolution 1021
- American Electric Railway Association, Annual Meeting 839
- American Railroad Company at Porto Rico 780
- American Railway Association :—
  - Fall Meeting 933
  - Meeting 78
  - Spring Meeting 409
- American Railway Problem As Viewed by European Experts 857
- An Unfortunate Delay 704
- Andrews, Frank, An Address 203
- Animals :—
  - On Tracks, Injury to 669
  - Trespassing 670
  - Trespassing on Right of Way 752
- Annunciator Being Tested by Baltimore and Ohio, Locomotive Speed 381
- Anthracite :—
  - Coal Mining, The Extent of 327
  - Shipment, The Year's 34
  - Shipments, August 758
  - Shipments, February 326
- Anti-Trust Legislation, Progress in 846
- Anti-Trust Program 667
- Aquitania 275
- Arbitration Board, To Settle Disputed Interpretation 333
- Arc Welding 383
  - Electric 1008
- Argument of Counsel Cause of Error 930
- Arizona Road Begun, Work on New 676
- Association of Railway Electrical Engineers, Convention of 579
- Association of Transportation and Car Accounting Officers, Change in Meeting Place 324
- Association to Improve Freight Service, Formation of New 235
- Atchison, Topeka and Santa Fe Railway :—
  - Annual Report 734
  - California Pre-Cooling Plant 891
  - Safety Developments on the 737, 819
- Attacks Upon Railroads Harmful to Country's Prosperity, Political 264
- Attitude, An Antagonistic 853
- Authority to Condemn Land, No 930
- Automatic Electric Block Signal System on Southern Railway, Installation of 936

B

- Baltimore and Ohio Railroad :—
  - Annual Report of Police Department 214
  - Declares Its Regular Semi-Annual Dividends 554
  - Effort to Suppress Trespassing on the 465
  - Fire Organization 736
  - General Safety Committee of the 212
  - Improved Safety Results 59
  - Increased Terminal Facilities on Long Island 569
  - Installation of Modern and Sanitary Dairy Refrigerator Cars 824
  - New Terminal at New York 488
  - Opening of the Magnolia Cut-Off of the .. 1023
  - Passenger Fare Increase on 925
  - Plans Issue of General Refunding and Improvement Mortgage 798
  - President Willard's New Year's Greetings to Employes 65
  - The Economic Significance of the Magnolia Cut-Off 836
- Banquet to Transcontinental Traffic Association, Exposition Officers 408
- Barometer, A Railroad 462
- Baxter, W. M., Address, Statistical Control of Railroad Operation 807
- Belgium Bridges, Canadian and American Engineers to Rebuild the 1023
- Bill :—
  - Aimed to Remove Offices of Interstate Commerce Commission to Chicago 236
  - To Regulate Water Carriers 500
- Bill-of-Lading, Issuance of 753
- Birmingham, New Double Track Service at 829
- Blizzard, How a Great Railroad Copes with a .. 278
- Bonner, Francis A., A State Railway Rushing Wilfully to Ruin 199
- Book Reviews 82, 205, 261, 588, 590, 762, 1026
- Boston and Maine Railroad :—
  - Development of Safety First Work 558
  - Safety Developments 643
- Bourne, Chairman, On Government Ownership .. 693
- Bradshaw, George, The Personal Injury Problem. 981
- Brandeis, Louis D., Proposes Amendment to Railroad Security Bill 574
- Bridge:
  - Construction, Progress in 331
  - In the World, Largest 822
- Bridges Property of City 930
- British :—
  - Enginemen's New Istruction Van 546
  - Investment in United States Railway Securities on the Decrease 640
  - Railway Developments, Recent 287
  - Railways May Demand Further Rate Increase 429
- Brooklyn's Marginal Railway Plan Revised 569
- Brotherhood of Locomotive Engineers, Election of Officers 78
- Brunswick, Ga., Southern Railway's Improved Shipping Facilities at 1010
- Buffalo, Rochester and Pittsburgh, New Rochester Warehouse 746
- Bureau of Explosives, Report of the Chief of 295
- Bureaucratic Methods, The Influence of 778
- Business:
  - And the Government 343
  - And the Government, Big 3
  - Man and the Rate Advance 961
  - Man's Interest in a Liberal Railway Policy 774

C

- California Pre-Cooling Plant of the Santa Fe System 891
- "Call to Colors" for the Railroad Army, A 433
- Campaign for Quiet Stations 781
- Canada :—
  - Activity of Terminal Work in 746
  - Railway Construction in 82, 937
- Canadian Pacific Railway :—
  - A New Pit Car 648
  - New Thirty-Ton Stock Car 1004
  - Proposed Electrification on 316
  - The Blue Flag Holder of the 888

275416

- Canadian Railway Club:—
  - April Meeting of 406
  - December Meeting of the 77
  - February Meeting of 324
  - November Meeting 930
- Canal Tolls Issue 353
- Canceling the Privilege of Industrial Lines 197
- Cantaloupe Crop, Pacific Coast 327
- Cape Cod Canal 890
  - Cut Through 431
- Capitalization at Home and Abroad, Railway 431
- Car:—
  - A Convertible Stock 910
  - An Interesting Dump 306
  - Balance and Performance for May 737
  - Canadian Pacific's New Thirty-Ton Stock. 1004
  - Deflector and Ventilator, A New 214
  - Erie's New Dynamometer 304
  - For Minneapolis & Northen Gasoline Motor Railway, Self Propelled Freight-Passenger 561
  - For Pennsylvania Railroad, New All-Steel Cabin 834
  - For Street Railway Construction Work, A New Car for 650
  - Interchange 902
  - Loading Improvements at Baltimore 316
  - Shortage Predicted 583
  - Shortages, Co-operating to Prevent 231
  - Supply in Relation to Marketing the Wheat Crop of 1914 621
  - Wheel Press, A Double End 71
- Car Situation 210, 381, 463, 555, 641, 736
  - Latest Report on 815, 904
  - On December 15th 56
- Care to be Exercised, the Degree of 669
- Carriages for London Underground Railways, New Steel Middle Door 288
- Cars:—
  - For Mexican Federal. Armored 471
  - For the Rio Grande, New Steel Postal 936
  - Into Street Crossing, Backing 930
  - Reinforced Ends for Wooden Box 472
  - Reinforcing Wooden Box 305
  - Steel Box and Automobile 472
  - Steel Passenger 299
  - Worth More Than Demurrage 76
- Cartoons, Public Sentiment as Reflected by 340
- Cash Investment of the Railways During Six Years 552
- Cast Iron Wheel Records 308
- Census Report on Electric Railways 743
- Central Passenger Association, Meeting of 77
- Central Railroad Company of New Jersey, New Locomotive Terminal Facilities at Communipaw. 483
- Central Railway Club:—
  - Annual Dinner of 232
  - January Meeting 78, 234
  - May Meeting 492
- Chamber of Commerce of the United States, Second Annual Meeting 232
- Chattanooga, Tenn., Terminal Improvements at 221
- Chicago, Ordinance Passed for New Union Terminal 315
- Chicago and Alton Railroad Adopts Automatic Mail Exchange System 994
- Chicago and North Western Railway:—
  - Annual Report of the 732
  - Awards Safety Banner 380
  - Comfort for the Ladies 73
  - Dining Car Service Inaugurates New Sanitary Feature 65
  - Growth of Sanitation 296
  - Lounging Car on the 216
  - New Passenger and Freight Stations at Huron, S. D. 401
  - Potato Growing Campaign in Wisconsin. 416
  - Safety Congress 932
    - Organization 56
    - Record 994
  - Telautographs in New Chicago Station 216
  - Wins Special Recognition for Safety Work 213
- Chicago. Burlington and Quincy, New Dining Cars 332
- Chicago Great Western Railway:—
  - Annual Report 735
  - Safety Movement on the 464
- Chicago, Indianapolis and Louisville, Annual Report 733
- Chicago, Milwaukee & St. Paul Railway Company 734
  - New Four and One-Half Per Cent. Bonds. 554
- Chicago:—
  - Railway Terminals 312
  - Roads to No Longer Absorb Switching Charges 758
- Cincinnati, Hamilton and Dayton, Police Department 298
- Cincinnati, New Orleans and Texas Pacific Railway 331
- Cities May Not Become Investors in Railroad Stock 668
- Civic Federation, Fifteenth Annual Meeting of the 932
- Clark, John Maurice, The Panama Canal and the Railroads 987
- Class Legislation 666
- Classification Committee, A Smaller 77
- Clayton Bill, Passage of the 926
- Coal:—
  - Roads Indicted Under Anti-Trust Law 670
  - Sprinkler, The Hancock 303
- Colorado & Southern Passes Dividend on Preferred Stock 293
- Colorado Coal Strike. Railroad Losses from 380
- Comfort for the Ladies 73
- Commerce and Navigation of the United States for the Fiscal Year 582
- Commission:—
  - Regulation, The Development of 664
  - To Examine and Test Safety Appliances 75
- Comparison:—
  - Between British and American Railway Employes 581
  - Between the Gross Earnings and Operating Expenses of Steam and Interurban Electric Lines, A 217
  - Of Railway Returns Favors European Roads 608
- Concrete to Structural Steel, Applying 563
- Condemnation of Railroad Right-of-Way 845
- Conditions:—
  - General 603
  - May Impose on Railway Company 929
- Congresss:—
  - May Charter Railroad Company 929
  - Postponed, World Railway 1021
- Construction. 82, 238, 239 331, 584, 674, 756, 936, 1022
  - In Gas-Electric Motor Cars, New 916
- Constructive Action, the Need of the Hour 785
- Contemporary Opinion, 15, 173, 262, 352, 433, 521, 610, 703, 783, 865, 961
- Continuous Crossing of Simple Design, A 647
- Control of Railroad Operation, Statistical 807

VOL. LVIII. JANUARY, 1914 No. 1

Important Developments in the Transportation Field

RETROSPECT AND PROSPECT

As a whole the railways of the country are glad that 1913 is now well behind them and that many of the problems which so sorely perplexed them during the past twelve months are in a fair way to a satisfactory solution. This does not mean that the immediate future is necessarily bright with promise, but railway officials are naturally optimistic by nature and with slight encouragement are ready to throw tremendous efforts into the up-building of their business. Recently this encouragement appears at least to be in view, and while as yet, has assumed no definite form, it is hoped and believed by a majority of railway managers, that the Government is at least seriously contemplating the necessity of coming to their assistance by permitting such a readjustment of their freight rates as will enable them to carry out their plans for more and better railways.

Among the developments of the year which may be briefly mentioned, was first, the Federal Supreme Court's decision in the Minnesota rate cases which compelled a number of Western roads to put in operation both freight and passenger rates which they claimed to be of an unremunerative character. In other words, the decision resulted in the railroads operating in Minnesota, changing from a three-cent to a two-cent basis per mile of instrastate passenger fares and reducing intrastate freight rates in certain instances twenty-five per cent. In the West Virginia passenger rate cases, the Supreme Court also ruled that the railroads of that state must abide by the provisions of the two-cent fare law passed by the state legislature.

Another development of unusual importance was the passage of the physical valuation bill which places upon the shoulders of the Interstate Commerce Commission, the responsibility for making a physical valuation of the railroads of the United States. For this purpose the country has been divided up into five districts and the work put under the supervision of Charles A. Prouty, who has resigned from the Interstate Commerce Commission to direct it.

A third development was the decision of the Interstate Commerce Commission reducing the rates of express companies and affecting their total income to an estimated amount of $26,000,000 a year. This decision also naturally affected the income of the carriers, as well as did the establishment of the parcel post, which has so far necessitated the carriers transporting hundreds of tons of parcel post matter for which up to the present time, they have received no proper compensation, the five per cent increase in railway mail pay being entirely inadequate to pay for this service.

Labor developments have played an important part in the year's railway history, and railway labor under arbitration proceedings have been able to procure important and very general increase in their wages. One of the important questions for future settlement, is the development of some definite plan upon which future increases shall be based, as under existing methods, the men are at liberty to demand increases ad libitum. As all settlements up to the present time show, arbitration has resulted in a compromise always favorable to the men.

One of the particularly unfortunate developments of the year was the impeachment by the United States Senate and final conviction, of Judge Robert W. Archbald of the Federal Commerce Court. This served, although unreasonably, to intensify the opposition of that court and finally resulted in its abolition. A real and useful function in railway regulation, has, however, been destroyed by the discontinuance of this court and it is generally hoped not only among railway officials, but among shippers and others who have come to appreciate the necessity of such a body, that Congress will sooner or later pass supplemental legislation which will permit the establishment of an other court along somewhat similar lines.

The New England railway situation held the center of the stage of railway activities for a number of months during the latter part of the year owing to the storm of public criticism which developed towards railway operations in that section of the country. This finally led to the resignation of President Charles S. Mellen and the appointment of Howard Elliott to head the New Haven system. Since Mr. Elliott has taken control, the situation has steadily and rapidly improved and friendly relations are being established, not only with the people of New England, but with the National and State Governments who up to within recently, have been threatening dire consequences unless some very considerable change of policy was put into effect. Mr. Elliott has attacked the tremendous problems which face him, in his usual vigorous manner, and is fast winning the esteem and confidence of all those with whom he comes in contact. It is confidently predicted that the end of another year will find the New Haven firmly established in the good graces of the people of New England.

The year witnessed many important changes in the personnel of railway management. As previously mentioned, Howard Elliott left the Great Northern to become president and later chairman of the Board of Directors of the New Haven. This led to the election of W. P. Clough as chairman of the Board of Directors of the Great Northern, and of J. M. Hannaford as president of the same company. Another Western change of importance was the election of Mr. T. M. Schumacher as chairman of the Board of Directors of the Chicago, Rock Island and Pacific and as also chairman of the Executive Committee of the same road, succeeding D. G. Reed and W. H. Moore, respectively. Another change of importance was caused by the receivership of the St. Louis and San Francisco and the Chicago and Eastern Illinois roads, which resulted in the resignation of B. L. Winchell as president and his appointment as one of the receivers. Later he resigned as receiver to become director of traffiic of the Union Pacific system. In the East, William C. Brown resigned the presidency of the New York Central Lines to be succeeded by A. H. Smith, who, at the time of Mr. Brown's resignation, was senior vice-president of the system.

The year was also unusual on account of the number of deaths which occurred among prominent officials. Roswell Miller, chairman of the Board of Directors of the Chicago, Milwaukee and St. Paul died in New York on January third. On March 28th James McCrea, who, on the first of the year had resigned as president of the Pennsylvania Railroad, died at Haverford, Pa. On November 20th John H. Marble, a member of the Interstate Commerce Commission, died in Washington, and November 25th witnessed the death of both W. W. Finley, president of the Southern Ranlway, and T. M. Emerson, president of the Atlantic Coast Line. A full list of these deaths will be found in another section of this issue.

Railway construction during 1913 was far from satisfactory. While it did not essentially differ from the two previous years, it was not of the size or character which a country still young in commercial and industrial possibilities, should command. The total in round figures was 3,000 miles. The states receiving the largest amount of new mileage being, in the order given, Montana, Texas, Washington, California, North Dakota and Arkansas. Only twelve states in the Union showed new construction of more than one hundred miles. Of the roads responsible for this new construction, the Chicago, Milwaukee and St. Paul led with a total of 150 miles.

From a financial point of view, the year also proved unsuccessful. While gross earnings held up fairly well until near the end, net earnings began to show a dangerous tendency before the year was half over, and for the past six months results have been such as to cause grave concern among those in charge. Everything seems to have operated together during 1913 to bring about unsatisfactory financial conditions. Increased taxes, expensive regulation, higher wages, costlier supplies, unusually heavy damages from wrecks and floods, have all added to the carriers' burdens and have made the year one long to be remembered as one of unusually unfavorable developments.

It is not to be wondered at that such conditions have had their effect upon the railway security market and the amount of new securities placed during the year has been unusually small. Conditions have been so highly unsatisfactory, that many important roads have suspended entirely their efforts to procure new capital until the market becomes more favorable. At the present rate of earnings, rates for new money are practically prohibitive and it looks as if the investment of new capital in railway enterprises must practically cease unless the Interstate Commerce Commission sees fit to grant relief by permitting the necessary increase in freight rates.

The record of receiverships does not adequately express the condition which has been confronting many important lines during the past few months. While comparatively small, many roads have managed to drag along with the hope that the near future will bring about a change which will make unnecessary a resort to drastic measures. During the year the railroad receiverships numbered seventeen, representing a funded debt of $386,000,000, and total stock capitalization of $92,000,000.

So far as new equipment is concerned, the roads ordered more liberally during 1913 than during the preceding year, the total of freight cars built and ordered being nearly 208,000 and of passenger cars, considerably over 3,000. The total number of freight cars was the largest number built and ordered in the past fifteen years with the exception of the years 1906 and 1907. The locomotive orders for 1913 amounted to approximately 3,500, being one thousand under the orders placed during 1912.

BIG BUSINESS AND THE GOVERNMENT

There have been a number of encouraging developments recently which have led to the belief that the methods of conducting large business enterprises may be voluntarily readjusted in harmony with the Sherman antitrust law without the necessity of suits being brought by the United States Government.

For a while it looked as if extensive suits would be brought against the American Telephone and Telegraph Company, and in fact, feeling ran so high that there was talk in official circles at Washington, of government ownership of telephone and telegraph lines, as the only way to meet the difficulty. Such a plan has received the active support of Postmaster General Burleson, whose annual report contains a sweeping declaration in favor of the principles of government ownership of telephone and telegraph lines.

In discussing the probable action on the part of Congress along the lines of the Postmaster General's recommendations, ex-Senator Bourne, who was for six years a member of the Senate Postoffice Committee and the chairman of that committee for two years, has issued a public statement in opposition to the proposal. He says:

"I have not a dollar's interest in any telephone or telegraph securities. I am theoretically in favor of Government ownership of telegraph and telephone lines, but practically bitterly opposed to it. Why, because to my mind, it would be the beginning of Government ownership of national public utilities, eventuating in bureaucratic paternalism, dry rot, and inside of a century, governmental dissolution. I submit the following figures:

EX-SENATOR BOURNE OF IDAHO.

Who deprecates the tendency displayed in some Government quarters towards government ownership of public utilities, such as the telephone and telegraph lines.

Number of—

1911—Government civil employees	410,332
1912—Telephone employes	221,000
1912—Telegraph employes	40,000
1911—Railway employes	1,669,000
1909—Electric employes	209,729
1006—Water transportation	188,000
1907—Express companies	79,284
Total	2,818,345

"Under Government ownership and operation, there would be soon over 3,000,000 Governmental employes.

"'Taking into consideration the fact in the last ten Presidential elections, the President has elected by a plurality varying from 7,000 plus to a little over 2,500,000, the thought naturally arises that three million Governmental employes could absolutely control the Government under our political machinery, the tendency being more pay, less service in Governmental employment, resulting in resistless efforts of the outside labor to secure Government employ, because less onerous and more remunerative, with accumulative dissatisfaction and irritation in all private enterprises.

"Two years ago in the parcel post study it developed that the express companies had about 85,000 employes receiving an average wage scale of less than $50 per month, while the postal employes performing a similar service received an average of $93 per month, demonstrating that under Government ownership and operation of express companies the wage scale would cost the Government, conservatively speaking, thirty million dollars more for operation in labor payments than it did the express companies.

"Governmental efficiency and economy of operation can never equal that of private enterprise, and the sole desiderate of Government

President Woodrow Wilson.

Whose recent utterances regarding big business have led to a feeling of encouragement and reflewed confidence.

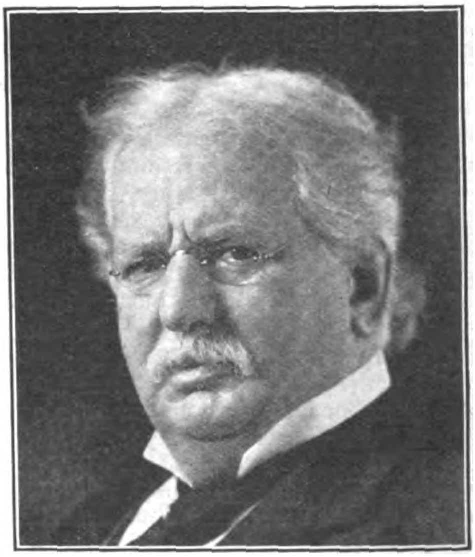
> should be equal legal opportunity for all and limitation on individual liberty only in his prohibition of preying on the personal or property rights of others. Our present drift to departmental rule and regulation instead of a Government of law, which is the greatest menace to the future of our country, would, in my opinion, simply be accentuated by Governmental ownership"

Theodore N. Vail, president of the American Telephone and Telegraph Company, has also taken occasion, in a newspaper interview, to discuss the recommendations made by the Postmaster General. Mr. Vail asserts that while of course the Government has the power to take over the telephone and telegraph lines, if they should decide to do so, he points out that it is a long step between the appraisement of the properties and taking them over. This requires both a great deal of consideration and a great appropriation. Discussing this phase of the question he says:

> "The properties are worth a great deal more than the securities issued against them. The book value of all the properties of the Bell Company and its associated companies is $160,000,000 greater than all the outstanding securities, and the appraised value of the properties is from ten to fifty per cent greater than the book value. Every public appraisement of any of our properties has shown that the actual value of the property is from ten to fifty per cent greater than the book value.
>
> "But this Government ownership is only rumor. Postmaster General Burleson may have recommended it, but until the question really becomes an Administration measure there is no necessity of discussing the matter fully or seriously. You know that other Postmaster Generals have advocated Government ownership. Mr. Hitchcock did, and you know that public officials sometimes have ambitions.
>
> "No, I am not in favor of Government ownership. My experience has been that it is not as satisfactory as private ownership. Public ownership in other countries has not been satisfactory. It's poor in France. I know what it is in Germany, and you have heard what it is like in England. It's not the kind of service you get in this country."

In the meantime, the American Telephone and Telegraph Company have reached an agreement with Attorney General McReynolds by which the company agrees to reorganize and so obviate the necessity of a suit against it for dissolution under the anti-trust law.

The terms of the agreement in brief, include the disposal of the company's holdings of stock in the Western Union Telegraph Company, the guarantee not to acquire control over any other telephone line or lines in the future, and the promise to permit independent telephone companies of the country to use its interstate wires. It is asserted that the Attorney General concedes that when a corporation of such magnitude, on its own motion, relinquishes its holdings in other companies and agrees to other propositions put forward by the Gov-



Theodore N. Vail.

President of the American Telephone and Telegraph Company, which recently has volunteered to reorganize its business in accordance with the provisions of the Sherman Anti-Trust Law.

ernment, it should be treated with every consideration in carrying out the terms of the agreement. It is understood that the plan not only meets with the hearty approval of the Attorney General, but with that of the President of the United States as well. In fact, so significant is it, that there now appears to be a prevailing opinion in Washington that legislation to acquire the country's telephone business will not be pressed by the Administration at the present session, in spite of the Postmaster General's recommendations.

Clarence H. Mackay, president of the Mackay Companies, also had the following to say regarding Postmaster General Burleson's recommendations:

"The Postmaster General is mistaken in his idea that telephone companies are subject to the Post Road Act of Congress of 1866. The Supreme Court of the United States in the Richmond case (174 U. S. 761) held that they are not.

"In denominating the telegraph business as being 'monopolistic in its nature' he is also mistaken. If there ever has been more continuous, keen and even bitter competition than that between the Postal and the Western Union I would be pleased to know when and where.

"The money question, however, is the main question; $900,000,000 would not be a lookin; the Bell Telephone companies alone would demand more than that. Then there are the thousands of independent telephone companies and farmers' lines scattered all over the country. The entire bill, including telegraph lines, would be about $2,000,000,000, which is about two-thirds of the national debt at the close of the Civil War, when many intelligent men despaired of the solvency of the Republic.

"Nor is this the worst, judging from English experience, that vast sum would be entirely lost, because under Government management the operating expenses year by year would exceed the income. The following figures are taken from a report of the Postmaster General of Great Britain, showing the results of Government ownership of telegraphs in that country:

	Receipts.	Actual operating expenses.	Operating loss.	*Total annual loss.
1908 ..	$15,516,805	$17,542,840	$2,026,035	$4,847,425
1909 ..	15,492,245	18,394,005	2,901,760	5,248,245
1910 ..	15,830,960	17,841,015	2,010,055	5,081,835
1911 ..	15,829,960	18,659,710	2,829,750	†5,911,605
1912 ..	15,747,420	18,985,090	3,237,670	5,636,965

*Including interest paid and fresh money expended.
†Estimated.

"And as to service—government service would be a joke as compared with present service. If you don't believe it just try the government service—telegraph and telephone—in Europe.

Following closely on the heels of the telephone company's decision to conduct its business in strict conformity with the Sherman anti-trust law, comes the announcement of the retirement of J. P. Morgan and four of his partners from thirty directorships in twenty-seven corporations. This action on the part of the country's greatest banking concern, calls attention to the fact that five important recommendations of the Pujo Committee have already been put into effect in advance of legislation of a compulsory character. They include the abandonment of fiscal agency agreements, such as existed between the New Haven and Morgan and Company; the abolition of interlocking directorates, the abolition of voting trusts, reforms in the Stock Exchange, and reforms in the clearing house. Whether Mr. Morgan will decide to withdraw from the directorate of the United States Steel Corporation is the subject of a great deal of speculation. The general opinion is that as the so-called steel trust was the greatest of the Morgan creations, and was considered by the elder Morgan the crowning achievement of his financial career, his son will consider it his duty to remain identified with it in an active way, especially until the Government suit has been decided one way or the other.

J. PIERPONT MORGAN.

Who with four of his partners, have recently resigned from thirty directorships in twenty-seven corporations, in order to meet the desires of the administration with regard to interlocking directorates.

It is also understood that George F. Baker another dominant figure in American finance, is soon to take similar action in withdrawing from the directorates of many large corporations. As a matter of fact, it is understood that Mr. Baker began severing such relations two years ago and will continue to do so as rapidly as he finds it possible. While other firms have as yet remained silent, the Morgan action is recorded as prophetic and is looked upon as the beginning of the end of the system of interlocking directorates which has been so bitterly attacked within recent years. It is hardly necessary to add that the action of Mr. Morgan has proved highly gratifying to the Government officials at Washington.

In addition to these important developments, President Wilson's attitude as expressed in his letter to Mr. McReynolds, and in his address made immediately after the signing of the currency bill, indicates the Administration's desire to co-operate with the public in the promotion of prosperity and the development of big business along legitimate lines. The talk of anti-trust legislation has already begun to lag at the National Capitol and the country is now looking forward more confidently than at any time within recent years, to a cessation of Government hostility towards business. It is certain that many Congressmen favor the plan approved by the President of permitting the trusts to disorganize out of court, thereby saving litigation and commercial disturbance, and it is also certain that the President himself desires it to be generally understood that honest business need have no fear from the present Administration. The keynote of his Administration thus far, has been the elimination of personal privilege and the giving of an equal opportunity to all. This has been reflected in the tariff act and in the currency act, and strongly suggests what may be the character of future anti-trust legislation.

DEVELOPMENTS IN ADVANCE RATE CASE

The most important development of the month in the Eastern advance rate case has been the action taken by the Interstate Commerce Commission in sending to the railways in Official Classification territory, a series of questions designed to develop further facts concerning the physical and financial operations of the roads in that section of the country. That the Commission appreciates the necessity of a prompt decision in this case, is indicated by the time limit set for answering these questions, which is January 31st. The questions are contained in a twenty-five page pamphlet and call for an enormous amount of material.

In submitting these questions, the Commission points out that while elaborate and helpful information has already been submitted by the roads showing the diminishing net returns from operations, these statements in themselves, do not furnish fully the data deemed by the Commission to be necessary to determine the general course the carriers may pursue to meet the situation, and for this reason, it has been found necessary to ask for additional data. It is the understanding of the Commission that some of the railroads are in a position to make full response to the questions without substantial delay, while others will require some time to compile their replies.

Summarizing the purport of the great mass of detailed information asked for, the Commission raises the following issues:

1. Do the commodities which are shipped in great quantity over long distances, such as grain, coal, meat, lumber, ore, iron, steel, cement, bear their fair proportion of the cost of railroad service, and is the disparity between through and local rates only what it should be?
2. Are passenger, express and mail traffic bearing their due proportion of operating and capital expenses? To what extent has State regulations of passenger fares reduced revenues
3. Are the carriers fully justified in making all the allowances they make shippers for lighterage, their own switching, use of "industry tracks," and in rendering all such free service as switching, loading and unloading freight, warehousing, reconsignment and milling-in-transit privileges, and special rates and train service?
4. Do the railroads purchase their supplies under competitive conditions, rigidly enforced as to quality of materials accepted, and do they employ scientific methods in testing equipment and supplies purchased?
5. To what extent are directors or officers of the carriers interested in firms or corporations selling materials or equipment to the railroads, or purchasing their securities, and what is the effect upon the railroads of such relations?
6. Should the railroads obtain more favorable terms from the Pullman Company, or could they get better financial results from operation of their own sleeping car service?

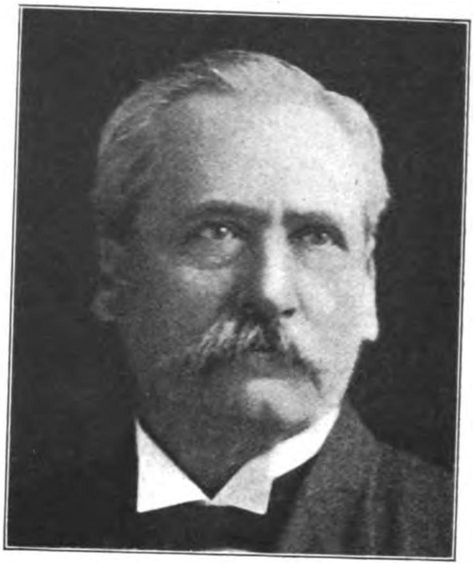
Gathering and returning all this information will cost the railroads heavily and may prolong the investigation, but if the result should be to confirm the asserion of the companies that there is no other way out of their impossible situation than an increase in rates, it will have been well worth the time and money. Furthermore, in replying to these questions, the railways will have full opportunity to permanently and effectually allay the general suspicion, due largely to the efforts of Mr. Brandeis, that their purchasing departments are loosely governed and that wasteful methods have characterized, to some extent, the purchase of supplies. While this additional burden at the present time is almost in the nature of a hardship, it has its encouraging feature, in that it surely indicates that the Commission is seriously impressed with the necessity of granting some measure of financial relief. While it does not necessarily follow that the Commission will grant the exact requests of the carriers, it shows an appreciation of the extent of the carriers' difficulties and an apparent desire to provide a substantial measure of relief.

Another encouraging feature of the situation, is that scarcely a day passes without public expressions of opinion from prominent shippers or commercial organizations to the effect that they favor, or at least will not object to, such increases in rates as will permit the carriers to conduct a progressive plant. Important commercial interests in a number of large cities are urging prompt action on this question, as the belief is rapidly growing that the Nation's progress and prosperity largely depends upon a fair and liberal treatment of the transportation interests, which it is seriously questioned at the present time, they are receiving. In other words, many commercial leaders are expressing themselves as confident that the American people are now ready to approve a rate advance and very few express doubts that such action will be taken. Already a number of representative leaders in commerce have forwarded private messages to Washington urging early and favorable action on the proposed rate advances, as a means of bringing about more normal general trade conditions.

A recent notable addition to the forces favoring the rate advances, is that of the Illinois Manufacturers' Association, which has decided to drop its opposition, as a recent report of a special committee which has been investigating railway conditions, announces that shippers might better stand the increase in rates than suffer an impairment of service that would follow a refusal to grant such increases.

In citing reasons for their change of opinion, the resolution stated:

"That the increase in wages granted through arbitration, the increase in taxes, the increased expenditure to insure greater safety to both the men and the public and the increase caused by legislation of the full-crew type have so increased the operating expenses of the railroads in general that the net revenues are insufficient to provide for that degree of rehabilitation and extension of facilities which prompt an efficient service to the shippers' demands."



JUDSON C. CLEMENTS.

Who President Wilson has appointed to succeed himself on the Board of the Interstate Commerce Commission.

That the public is beginning to realize how intimately this whole question is associated with their welfare is evidenced by many of the resolutions which are being passed by trade organizations, such, as example, the following, which was passed last month at the annual meeting of the Albany Chamber of Commerce, and was unanimously adopted:

Whereas, Financial statistics show that the savings banks of six States in the East have 6,636,343 depositors and that twenty per cent of their deposits are invested in securities of railroads, and,

Whereas, Albany has seven savings banks with 115,575 depositors and $88,420,704.75 total assets, a large part of which is invested in railroad securities, and,

Whereas, The increasing commerce of our country is constantly demanding more railroad equipment and larger terminals for its rapid movement, and,

Whereas, In the present unsatisfactory totals of railroad net earnings they are unable to borrow money for urgent improvements at a moderate rate of interest, now,

Therefore, We, the Albany Chamber of Commerce, most respectfully request the Interstate Commerce Commission to grant the application of the railroads for a five per cent increase in freight rates.

Railway men viewed with considerable relief the President's recent reappointment of Judson C. Clements to the Interstate Commerce Commission. When the freight rate hearing began on November 24th, a feeling of uncertainty existed regarding its outcome, because three vacancies were soon to be filled on the Commission. John H. Marble died suddenly on November 21st, Charles A. Prouty's resignation to take charge of physical valuation work and the expiration of Judge Clements' term, created a fear that three new and inexperienced members might be appointed at a time when the railway situation particularly required its interpretation by those whose training and experience would fully guarantee a decision to the best interests of all concerned. The appointment of Mr. Clements has dispelled this uncertainty to a large extent.

DECLINE IN PURCHASING POWER OF RAILWAY EARNINGS

In our issue of December we recited the salient facts as presented by the carriers at the hearing before the Commission in the rate advance case dealing with the principal data which were offered to show the operating conditions and financial results of the business. These all undertook to demonstrate that the existing basis of rates was inadequate and pointed out that the operating expenses absorbed a greater proportion of earnings than ever before and that the net results were gradually diminishing and were insufficient for proper return on investment.

An examination of the figures as included in the presentation made by the carriers conclusively shows these facts. We will not again review these data in detail, and need only point to the general results of the business as shown in the comparison of 1913 with 1910, during which period there was an increase in property investment of 11.74 per cent, an increase in operating revenue of 15.09 per cent, an increase in operating expenses of 22.79 per cent and a decrease in net operating revenue of 5 per cent. The return on property investment for the year 1910 was 6.28 per cent, and in 1913 5.36 per cent.

These brief figures should be sufficient to demonstrate to the business man's mind that these ratios of receipts, expenditures and investment return are wholly disproportionate and that some readjustment of the conditions which produce these results is absolutely necessary for the proper maintenance of the industry.

A salient feature in the presentation of the carriers, and one which we consider should receive greater public attention than heretofore, is that of the purchasing power of the carriers' earnings, which it is shown has materially declined. In this connection, we quote the following from the testimony of Mr. Charles A. Conard:

> "I have endeavored in this discussion to limit myself to a few simple propositions, which I think are well understood among economists and have been sufficiently proved, so far as such matters are susceptible of exact proof. We have seen that there has been an advance in prices of commodities of a broad and general character. Insofar as the advance in prices has been uniform in different industries, and insofar as the increase in the wages of labor has corresponded to the advance in prices, equality of conditions under the present value of the dollar has been established. The railways, however, have not shared in this advance in the money expression of services in any such degree as other industries and wage-earners.
>
> It is worth noting in this connection that if the commercial clients of the railways have in nearly all cases been able to obtain an increase in their receipts in money, corresponding to its diminished purchasing power, these clients have not been called upon to disburse in freight rates the ratable proportion of their increased charges to the consumer, and have from the enforced rigidity of such rates in terms of money transferred an unearned increment to their own coffers at the expense of the railways. The railways have not adapted their charges, as have other industries, to the change in the purchasing power of money. They have continued to sell their services for an amount which has remained comparatively fixed in money, but has declined greatly in purchasing power. Such additional capital as they have sought by the issue and sale of securities has been obtained on higher terms than in former years, while its purchasing power, in materials and wages, has been much less than in former years. The railways have been in the peculiar position of seeing prices rising all around them, while they have been unable to make advances proportionate to their changed relations to other industries.
>
> "If the value of the money received by the railways for their services has so seriously declined in purchasing power as to deprive them of the means of meeting their legitimate charges and obtaining new capital at its present rental price, they are not on an equality with other industries; they are receiving a much less proportionate share of the proceeds of the economic output of the country than that which they formerly received; and they are less capable of contributing their share to equipping this country for unfettered competition with other countries in the field of production and international commerce."

PHYSICAL VALUATION PLANS

The Government Board of Engineers and the Committee of Railroad Engineers in charge of physical valuation, have held a number of conferences recently in Washington and have agreed upon a tentative plan of procedure in carrying out the work.

The railroads will furnish the Government with a complete inventory of all property owned, exclusive of grading. This inventory will give three valuations—original cost, replacement cost and replacement cost less depreciation. The Army Board will survey all rights of way and make cross-section surveys of the grading elevations and cuts and in conjunction therewith will check up the inventories previously submitted by the railroads. A railroad engineer representing the road under investigation will be permitted to accompany each Government board and the railroads will receive daily copies of the reports submitted by the Government engineers. It is estimated it will cost the Government between $25,000,000 and $30,000,000 to make a complete valuation of all the railroads. The cost to the railroads will be between $15,000,000 and $20,000,000.

Work started upon an experimental basis in January. The preliminary valuations will be in the nature of a try out, and will cover the properties of the Atlanta, Birmingham and Atlantic and the Norfolk Southern in the South, the Kansas City Southern in the Middle West, including about 100 miles of the Santa Fe and of the Rock Island in Oklahoma, where the railroads recently made reports upon physical valuation to the state commission, and of the San Pedro running from Salt Lake to Los Angeles. It is not expected that general operations on the other roads will be commenced before next summer.

Railroad officials generally continue to feel that a physical valuation, which can only be procured at an enormous expense, will serve no useful purpose after being completed. A president of a prominent road recently in discussing the possible results to be obtained from such a valuation said:

"When the physical valuation is completed it will be worthless because it will be obsolete. The time it will take to make a proper valuation will prohibit its being up to date or accurate. For purposes of taxation or rate making it is worthless. The value of a property is what it can earn. Earnings have no relation to initial cost or present cost or replacement value except indirectly. They have nothing at all to do with capitalization. Some of the lightest capitalized roads are the heaviest earners, and some of the heaviest capitalized are the lightest earners.

"The Government seeks to secure this physical valuation primarily for rate-making; second, for proposed legislation to control future issuance of capital, and third, to see if Government ownership is feasible. The Government, with few exceptions, will find that the railroad properties are physically worth more than their capital represents, but earnings on property investment vary so greatly because of varying conditions that the only test of intrinsic value is earnings.

"For purposes of taxation the States should determine upon a certain percentage of gross earnings. Every railroad management seeks to return the most gross business it is possible to show and all the property is capable of earning. There would be no opportunity to cover up if the basis was gross earnings rather than net. This plan would also avoid pitfalls of basing tax ratables on capitalization, physical valuation or efficiency of operation. Moreover, the taxing authorities would have the basis of taxation right in their hands in the monthly and annual reports filed with the Interstate and State Commissions."

PUBLIC EXPRESSIONS BY PROMINENT MEN

A number of important addresses in which the economic problems of the country are discussed, were made during the month by prominent men both in and out of the railway service.

Samuel Untermyer in addressing the members of the Illinois Manufacturers' Association on January 5th, declared that the country's greatest need was a powerful executive body to take over the work which the Attorney General of the United States

Samuel Untermyer.

JUDGE E. H. GARY.

Chairman of the Board of Directors of the U. S. Steel Corporation, who urges courage, détermination, confidence and conservatism in the steel business until the unusual strain imposed upon this industry by the new tariff law shall have passed.

and the Federal Courts have attempted in enforcing the disintegration of large corporations. Mr. Untermyer's specific recommendation to remedy what he considers a defect in the legal machinery of the National Government, rests in the establishment of an industrial commission into which he considers the present Bureau of Corporations should be merged. He believes that this step, and the enlargement of the powers of the Interstate Commerce Commission, are fundamental to any effective scheme for enforcing the segregation of unlawful combinations under the Sherman anti-trust act.

Judge Elbert H. Gary, chairman of the Board of Directors of the United States Steel Corporation in his recent New Year's greetings to the presidents of the subsidiary corporations urges courage, determination, confidence and conservatism as demanded until such time as the strain naturally imposed upon day-to-day conditions through the introduction of new tariff and currency laws has passed. He urges that expenditures be limited to necessities in order that cash resources of the corporation be conserved as much as possible pointing out that while the largest railroad systems may borrow funds on short term notes the Steel Corporation cannot afford to do so because of the sentimental effect of such proceedure.

Referring to the currency bill, tariff changes and the income tax, Judge Gary says:

"It is not necessary now to discuss the wisdom of any of these measures nor the final effect of any of them in the administration of our business affairs. But it seems to me we would be foolish in considering our immediate action to overlook the fact that there must necessarily be some strain upon conditions by reason of these important and perhaps somewhat radical changes in the laws of the country, and if so we ought to govern ourselves accordingly. The prudent man should have courage and determination and confidence and yet at the same time should look squarely in the face of all of the important factors that make for the welfare or otherwise of the country. This is a time for persistency, discretion and aggressive courage on your part. It is a period when every one of you should keep his hand on the throttle of his business engine.

"The word necessary as applied to expenditures perhaps is very comprehensive, but necessary expenditures should always be made. Foremost under that head I would say any money you can pay out to increase the safety of your employes is necessary and proper. Never hesitate to request appropriations for expenditure of money which is calculated to prevent accidents to your employes. Keep that thought uppermost in your minds and remember that any such request will be promptly approved."

Irving T. Bush, president of the Bush Terminal Company, recently made the following interesting statement regarding the outlook, from his point of view:

IRVING T. BUSH.

President of the Bush Terminal Company, who is emphatic in his praise of the new currency bill which he believes will prove a potent influence in a great expansion of American business.

JACOB H. SCHIFF.

Directing head of Kuhn, Loeb & Company, New York bankers, who also believes the new currency bill will prove instrumental in bringing about a speedy resumption of business.

"With the signing of the currency bill by President Wilson, I became an optimist. This does not mean that we may expect a great expansion of American business to-morrow or next week, but it does mark, in my opinion, the beginning of the next cycle of national prosperity.

"Tariff uncertainty is over and the currency measure, after the proper establishment of the system, will put this country in a position to take its place as an international money power and will give us a financial machine which will make us as nearly independent of foreign countries as it is possible for any nation to be."

Jacob H. Schiff, head of Kuhn, Loeb and Company, of New York, reviews the outlook by saying:

"With the passage of the currency bill, legislation highly pleasing to me, I expect to see a speedy resumption of business, and I am sure business confidence will be materially strengthened and conditions improved all over the country."

ANNUAL REPORT OF POSTMASTER GENERAL

In view of the fact that the railways are still struggling for a readjustment of railway mail pay conditions, and that as yet the Government has made no suitable provision for compensating them for the enormous amount of parcel post traffic, the great proportion of which they have undoubtedly been carrying without compensation of any sort, the statement made in the recent annual report of the Postmaster General to the effect that the postal service is now self-supporting for the first time since 1883, will be received with feelings of mixed emotion by railway officials.

The question of railway mail pay is one of paramount importance to the carriers in view of their insufficient net income of the past year, and it is earnestly to be hoped that the Government will recognize the grave injustice of the present arrangement and take prompt measures to grant the proper and necessary relief.

In his annual report the Postmaster General deals at some length on the matter of compensation to railroads for carrying the mails and states that the matter is now under consideration by Congress. Among other things he says:

"Compensation to railroads for carrying the mails, is, under the present laws, adjusted upon the basis of average daily weights of mails carried. In addition to this, certain rates of pay are allowed for full railway post office cars forty feet and more in length, fitted up and furnished for the distribution of mails enroute. Reference has been made in previous annual reports to the inquiry conducted by the Department under authority of law into the operating receipts and expenditures of railroad companies carrying the mails and the submission to Congress of the results of such inquiry, together with recommendations for a change in the method of adjusting pay.

"The whole subject has since been taken up by a joint committee of Congress authorized to make inquiry into the subject of postage on second-class mail matter and compensation for the transportation of mails. In the meantime,

ALBERT BURLESON, U. S. POSTMASTER-GENERAL.

the new conditions in the postal service, mainly those arising from the inauguration and the development of the parcel post system, are being given careful consideration in connection with the general question and before the commission is ready to report the final views of the Department will be submitted to it.

"The determination of what shall be the basis for ascertaining a fair rate of compensation for carrying the mails is not free from difficulties. From a careful consideration of the subject it becomes evident that the carriage of the mails by the railroad companies for the Government cannot be considered as of the same character of services as that performed by them as common carriers for the general public. The railroads have received certain benefits from the States from which they derive their corporate existence, and their interstate commerce is subject to the regulation of the Federal Government. Some of them have received substantial aid from the Federal Government by grants of lands and otherwise. They are declared by law to be post roads. As mail carriers they are agencies of the Post Office Department and are performing a governmental function. The postal business is not carried on by the Government for profit, but in furtherance of the constitutional power to establish post offices and post roads under which it furnishes postal facilities to all of its citizens. The railroads, therefore, may not deal with the Government as they would with a shipper who uses their facilities as a common carrier for profit or for some special advantage.

"When the data in hand and now being secured by the Department are thoroughly considered and analyzed the Postmaster General will lay before the appropriate committees of Congress the conclusions reached as to what will be just and adequate compensation for all services which the railroads are rendering or will be called upon to render the Government for mail transportation.

THE DEATH ROLL OF 1913

The year 1913 was especially noticeable in the large number of deaths of men who have held important positions and places in the railroad fraternity. Among these were four chairmen of boards of directors, nineteen presidents, two former presidents, four vice-presidents, five former vice-presidents, and numerous other officials well known with the companies with which they were associated.

It is impossible to contemplate the following list without a profound feeling of sadness, because of the fact that in all probability had it not been for the unusual stress and strain in railway developments of the past two or three years, many of these men would still be performing a service for their company and their country. It is to be hoped that the present year will see a cessation of this strain and that the whole situation will become more leavened with kindness and tolerance, permitting men to work in harmony and good fellowship. The list has been arranged according to months. May it never be necessary again to print so long a one.

JANUARY.

Barnes, J. T. Mason, Secy and Treas., Western Maryland.
Beach, Charles A., Prest., Catskill Mountain Railway.
Beach, Gaylor M., Formerly Special Agent, Pittsburgh & Lake Erie.
Bonfield, Thos. P., Prest., Kankakee & Seneca.
Coykendall, Saml. D., Prest., Ulster & Del.
Cull, E. H. B., Div. F. A., Wabash.
Douglas, Earl P., Agt., Star Union Line.
Ellison, J. M., Passenger Agt., Denver & Rio Grande.
Fell, Abraham, Formerly G. W. F. A., D. L. & W.
Hudson, Fred. C., Genl. Atty., Iron Mountain.
Lacy, Frank H., Com. Agt., Atlanta & West Point.
McGie, J., Supt., C. R. & Pac.
Miller, Roswell, Chairman of Board, C. M. & St. P.
Palmer, Stephen S., Prest., Green Bay & Western.
Parker, Geo. W., Genl. Agt., Illinois Central.
Preston, I. T., G. A., Frisco Lines.
Raoul, Capt. Wm. G., Railway President.
Reese, Edward, Roadmaster, C. M. & St. P.
Wann, John Thomas, Formerly Auditor, Erie Railroad.

FEBRUARY.

Brame, Milton H., Civil Engineer, M. K. & T.
Brendler, Otto, Trainmaster, C. M. & St. P.
Cairns, John J., Pessenger Agent, C. M. & St. P.
Cheever, A. S., Asst. to V. P., B. & M.
Copland, George, V. P., Secy. and Treas., Lexington & Eastern.
Fritz, John, Veteran Iron and Steel Master.
Fry, Urias J., Supt. Telegraph, C. M. & St. P.
Gilluly, Jos. W., Treas., Denver & Rio Grande.
Gossett, Charles E., Master Mechanic, M. & St. L.
Jenkins, J. E., City Ticket Agent., C. B. & Q.
Jones, Wm. R., Formerly Asst. Supt., Utica & Black River.
Law, Robert, Formerly V. P. & G. M., Col. & Northwestern.
Lassiter, J., Supt., Southern Ry.
McKeen, Wm. Riley, Formerly V. P., Vandalia.
O'Meara, W. J., E. P. A., C. B. & Q.
Price, H. A., A. G. P. A., Inter-Colonial Ry.
Randall, Wm., Aud., Frt. & Ticket Accts., C. B. & Q.
Roby, T. W., Comptroller, Seaboard Air Line.
Seymour, Robt. B., Formerly Chief Engineer, C. I. & S.
Singer, Wm. Jr., Formerly Land Atty., Southern Pac. Co.
Tyrrell, Patrick, Auditor, C. M. & St. P.
Williams, Henry A., A. G. Supt., C. M. & St. P.
Winne, Wm. N. D., Comptroller, C. M. & St. P.
Young, James C., Engineer, Union Pac.

MARCH.

Archibald, Peter S., Formerly Chief Engr., Intercolonial.
Augier, Alton, Formerly G. P. A., of W. & A.
Brandeis, Albert S., Genl. Solicitor, L. & N.
Buhrer, Caspar, Formerly Roadmaster, L. S. & M. S.
Crissey, John W., Asst. Engr. of Construction, L. S. & M. S.
Eden, Edward H., Formerly Northwestern Agent, D. L. & W.
Kerr, C. I., Trainmaster, C. R. I. & P.
McCrea, James, Prest., Penn. R. R.
Moss, Arthur W., Div. Supt., Penn. R. R.
Nicholson, Geo. T., V. P., A. T. & S. Fe.
Peck, E. A., Supt., St. L. S. W.
Petheram, J. W., Formerly Chief Engr., M. K. & T.
Price, John R., Pioneer Railroad Builder.
Rogers, Howard W., Trav. Frt. Agt., Illinois Central.
Rogers, Wm. E., Formerly N. Y. State R. R. Commissioner.
Scaife, Charner T., Chief Claim Agent, Illinois Central.
Smith, Reuben F., Prest., Cleveland & Pittsburgh.
Tapp, P. J., Com. Agt., Southern Ry.
Wood, Charles G., Formerly Treas., V. C. & P.

APRIL.

Carson, G. A., Prest., Catawissa R. R.
Coakley, Jeremiah J., Supt. Terminal R. R. Assn. of St. Louis.
Dickson, Henry C., Trav. Pass. Agt., D. L. & W.
Frost, Wm. H., Pioneer R. R. Contractor.
Gilman, D. H., Railroad Builder.
Kuersteiner, Emil E., Formerly Bridge Engr., L. & N.
McCord, John R., Formerly Trav. Pass. Agt., C. H. & D.
Metheany, Rich. R., Secy. & Aud., Grand Rapids & Ind.
Myers, F. H., Div. Supt., C. M. & St. P.
Pugh, Chas. E., Formerly 1st V. P., Penna. R. R.
Quackenbush, A. W., Formerly Master Mechanic, Q. O. & K. C.
Rump, George A., Com. Frt. Agt., Wabash.
Simpson, Lieut. Col. Wendell L., U. S. A. Retired. Head of Purchasing Department. Panama Railroad.
Tracy, Frank D., Real Estate & Tax Agt., C & A.
Wakeman, E. B., Former Supt., Minneapolis Union Railway.
Weller, John H., Formerly Supt., Dayton & Mich., now Toledo Div. of C. H. & D.

MAY.

Bowman, Peter E., Formerly Supt., N. Y., N. H. & H.
Burt, Horace G., Formerly Prest., Union Pac.
Chase, George E., Pass. Agt., C. M. & St. P.
Crocker, George G., Chairman of the Bd., Boston Transit Com.
Cutler, Jos. G., Roadmaster, N. P.
Davis, Wm. Ed., P. T. M., Grand Trunk.
Dunnean, Maurice, Roadmaster, C. R. I. & P.
Flagler, Henry M., Chairman of Board, F. E. C.
Lasier, Napoleon B., G. B. A., B. & O.
McCabe, J. C., G. F. A., C. R. I. & G.
Miller, Edwin O., Com. Agt., C. R. I. & P.
Seibert, Robt. S., Prest., East Broad Top R. R. & Coal Co.

JUNE.

Cramp, Edwin S., Formerly V. P., Wm. Cramp Sons S. & E. B. Co.
Cushman, John Clark, Formerly Secy., Plymouth, Kankakee & Pac., now part of N. Y. Central System.
Fitzgerald, Thos. J., Formerly Resident Engr., S. P. Co.
Heimrich, John, Prest., Great Southern.
Jones, Edwin Tracy, Aud. of Revenue, Southern Railway.
McAllister, Wm. K., G. A., S. P. Co.
Moore, E. W., Supt., M. & O.
Payne, Walter T., F. F. A., N. & W.
Rice, Hy. F., Former Genl. Supt., C. R. I. & P.
Walker, Hy. Wilkes, Retired Genl. Aud., Grand Trunk.
Ward, Francis E., Former G. M., C. B. & Q.

JULY.

Adams, Francis Hasley, Formerly Genl. Storekeeper, C. & N. W.
Aird, Gordon A., G. A., A. T. & S. Fe.
Brady, Anthony N., Chairman Bd. Directors, B. R. T.
Brown, Alex., Sig. Engr., C. M. & St. P.
Eaton, G. H., Asst. Master Car Bldr., Canadian Pacific.
Hanson, Arthur S., Formerly G. P. A., B. & A.
Haugh, James C., Resident Engr., N. O. & N. E.
Hill, David S., Genl. Supt., Lake Erie & Western.
MacKinnon, Paul R., Trav. Pass. Agt., C. R. I. & P.
McReynolds, Gavinus, Master Mechanic, Frisco Lines.
McRoberts, G., Div. Foreman, St. L. & S. F.
Maxwell, W. J., Grand Secy and Treas., Order of Railway Conductors.
Newhall, Daniel S., Purchasing Agt., Penna. Railroad.
Power, M. J., Genl. Storekeeper, Canadian Pac.
Robinson, Chas. J., Former Asst. Paymaster, S. P. Co.
Taft, Edward A., Mgr., Express Dept., N. Y., N. H. & H.
Taussig, Wm., Prest., St. Louis Bridge Co., Organizer and former Prest., Terminal R. R. Assn. of St. Louis.
Taylor, John H., Genl. Supt., Great Northern.
Thompson, Hy. Martin, One of the first three R. R. Commissioners of the State of New York.
Wheeler, Herman, Formerly A. G. P. A., C. & N. W.

AUGUST.

Brown, Vernon H., Former Am. Mgr., Cunard Line.
Cook, John S., Master Mechanic, Georgia R. R.
Coughlin, John J., Roadmaster, Las Vegas & Tonopah.
Courtright, J. A., Formerly Trainmaster, C. C. C. & St. L.
Fraser, George M., T. M. & Supt., Nev. Copper Belt R. R.

Haskell, Edward A., Formerly Div. Engr., B. & A.
Hudgins, Col. Hy. C., G. A., Norfolk Southern.
Holliday, John W., Supt., New Eng. Ry. Mail Service.
Irwin, George L., Formerly Div. Supt., C. & N.
McMillan, Alex. F., Chief Clk., Pass. Traffic Department, N. Y. C. Lines.
Silver, Herman, Former Receiver, L. A. & P.
Smith, W. C., Chief Engr., N. P.
Teillott, Thos. R., Former Supt., Pbgh., New Castle & Lk. E., now part of B. & O. R. R.

SEPTEMBER.

Andrews, George, G. A., Pac. Coast S. S. Co.
Crary, George W., Treas., N. O., M. & C.
Driscoll, J. J., Trainmaster, B. & O.
Hartman, H. W., Prest., Denver & South Platte.
Haupt, Samuel B., Prest. & G. M., Susquehanna, Bloomsburg & B.
Hudson, S. M., Auditor, Fort Worth & Denver City.
Hughes, George M., Prest. & G. M., N. J., Ind. & Ill.
Ingham, Wm. A., Formerly Prest., East Broad Top R. R. and Rock Hill Iron & Coal Company.
McCarrick, Jos. D., Div. F. A., Southern Ry.
Ray, Wm. F., Genl. Supt., B. & M.
Robertson, Fredk. C. N., Auditor, Pullman Co.
Smith, James, Formerly T. M., Wabash.
Taylor, C. M., Mechanical Supt., C. R. I. & P.
Trimble, Judge J. McD., Formerly Genl. Counsel, K. C. & M. & O.
White, E. T., Dist. Supt., Motive Power, B. & O.

OCTOBER.

Barnett, Wm. E., Former V. P., N. Y., N. H. & H.
Brown, Frank E., A. G. P. A., B. & M.
Carskaddon, Benj. W., Real Estate Agt., Pennsylvania Railroad.
Evarts, Maxwell, Genl. Counsel, S. P. Co.
Florence, Charles A., Exp. & Imp. Agt., Illinois Central.
Gillett, Ralph D., Prest., Hampden R. R. Corpn.
Grafton, Wm. McCullough, Sig. Engr., Penn. Lines West.
Hooper, D. E., Supervisor Bridges & Bldgs., Southern Railway.
Lee, George F., G. B. A., C. R. I. & P.
Noble, Stephen W., D. F. A., H. & T. C.
Parrott, Jos. R., Prest., Fla. E. C.
Prindiville, E. S., Trav. Pass. Agt., C. B. & Q.
Rawlins, Fredk. L., Supt., Telegraph, S. P. Co.
Roach, Milton C., G. E. P. A., N. Y. C. & H. R.
Sprigg, Wm. Osbourne, Formerly Supt., L. V.
Weymouth, E. P., Formerly Div. Supt., N. P.
Zollinger, L. R., Engr. Maintenance of Way, Penna. Railroad.

NOVEMBER.

Bettis, Horace I., Aud., San Pedro, Los Angeles & Salt Lake.
Charlton, James, Chairman, Transcontinental Passgr. Assn.
Emerson, Thos. M., Prest., Atlantic Coast Line.
Finley, W. W., Prest., Southern Ry.
Gordon, Wm. G., Asst. Aud., Treas. Department, C. B. & Q.
Hagerman, James, Former Genl. Counsel, M. K. & T.
Harris, Jos. E., Formerly Agt. Union Line of Penna. System.
Haskell, Fredk. A., Formerly G. F. A., N. Y. C. & H. R.
Johnson, W. P., Formerly G. P. A., L. S. & M. S.
Kretzinger, Geo. W., Atty., Grand Trunk.
Marble, John H., Member Interstate Commerce Commission.
Pfender, C. E., Aud. & T. M., C. & Ill. Western.
Ramsey, Matthew J., Chief Clk., to G. M. of Penn. Railroad.
Smith, Charles H., Trav. Frt. Agt., C. I. & S.
Vaughan, W. A., Former Genl. Supt., Southern Railway.
Williams, A., V. P. & G. M., Ocean Shore R. R.

DECEMBER.

Borner, William, Formerly Asst. to F. T. M., Penna. Railroad.
Chirm, E. J., G. F. A., Chesapeake S. S. Co.
Jones, Dwight A., Prest., M. R. & B. T.
Martin, Henry, V. P. & G M,, I. & G. N.
Musson, C. S., T. F. A., N. Y., C. & St. L.
Rhame, Mitchell D., Formerly Engr., C. M. & St. P.
Savage, F S., Advertising Mgr., A. T. & S. F.
Sutherland, David S., G. A., M. C.
Sweeney, Michael, Formerly V. P. & G. M., Trinidad & Brazos Val.
Thomas, John W., Jr., Prest. & G. M., N. C. & St. L.

Railroading in 1846.

(From the "Boston Herald.")

A CORRESPONDENT, Prof. Edward L. Morse, of Salem, sends us the following extract from a letter written by Louis Agassiz to his mother. The letter is dated Boston, December, 1846:

"Leaving Boston the 16th of October, I went by railroad to New Haven, passing through Springfield. The rapidity of the locomotion is frightful to those who are unused to it, but you adapt yourself to the speed and soon become like all the rest of the world, impatient of the slightest delay. I well understand that an antipathy for this mode of travel is possible. There is something infernal in the irresistible power of steam, carrying such heavy masses along with the swiftness of lightning. The habits growing out of continued contact with railroads, and the influence they exert on a portion of the community are far from agreeable until one is familiar with them. You would cry out in dismay did you see your baggage flung pell-mell like logs of wood, trunks, chests, traveling bags, hat boxes, all in the same mill, and if here and there something goes to pieces no one is astonished. Never mind! We go fast—we gain time; that is the essential thing."

And this was on the Boston & Albany! And there was baggage-smashing in 1846!

Contemporary Opinion

THE OUTLOOK AS VIEWED BY PROMINENT RAILWAY OFFICIALS.

THE New York *Evening Post* has for several years published, as a feature of its annual financial review, the opinions of prominent railway presidents regarding general railway conditions and the probable outlook for the new year.

It is of interest to note that the opinions published a year ago, proved remarkably accurate in forecasting the general results for 1913. In other words, at that time the consensus of opinion of railway presidents appeared decidedly optimistic as to gross earnings but was not so favorable with regard to net results. The general figures when completed will undoubtedly uphold these predictions, for while gross earnings for October, November and December are not likely to show so favorable results as they did for the corresponding months of 1912, the increase during the first nine months of the year has been such as to offset any decrease which may appear for the last three months. On the other hand, the decided decrease in net during eight months of the calendar year 1913, will leave a total decrease for the year of such decided proportions as to fully vindicate the opinions expressed at the beginning of the year.

As the *Evening Post* points out, a year ago railway presidents were strongly of the opinion that freight rates should be increased. As our readers know, this opinion has crystalized within recent months in the petition filed with the Interstate Commerce Commission for a horizontal increase of five per cent, in Official Classification territory. The questions which the *Evening Post* submitted to the railway presidents include a reference to this appeal for higher rates, as well as to a number of other important recent developments which are affecting the welfare of the carriers. These questions are as follows:

(1) Does the railway business for 1914 promise to be better than 1913, or worse.

(2) Do you expect the Interstate Commerce Commission to grant higher rates? What, to your mind, is the most conclusive argument in favor of the proposed increases?

(3) Is Government ownership of railways a possibility if the Government were to show continued reluctance to permit increased rates?

(4) Do you approve or disapprove of the Government's plan for physical valuation of the railroads?

(5) What special points impress you as favorable or unfavorable in the railway situation?

Many of the officials addressed, have taken the trouble to submit answers of considerable length and in such a manner as to throw a strong light upon several of the more vital problems now confronting railway management. These answers are presented herewith, those from all officials being grouped in accordance with each question:

QUESTION NUMBER ONE.

(1) Does the railway business for 1914 promise to be better than 1913, or worse?

F. A. Delano, President, Chicago, Indianapolis and Louisville.

(1.) I think the railroad business for the calendar year 1914 will hardly measure up to 1913, although I doubt if it will go very far behind it; in other words, that the losses which are likely to come in the first few months of 1914 will be largely made up by gains in the latter part of the year.

Ralph Peters, President, Long Island.

(1.) In my judgment, the railroad business for 1914 promises to be worse than in 1913, and yet the situation is such that conditions may change very quickly, resulting in an improvement, rather than a continuation of the present very unfortunate condition. With business adjusting itself to the new tariff conditions, with an advance in freight rates, and with the financial situation improved by the settlement of the currency question through the passage of some reasonable law by Congress, it is possible that the railroads can so adjust their finances as to undertake new developments and improvements that will start up all classes of business. A discontinuance of the restrictive legislation being adopted in all state legislatures, and the leaving of all such matters to the Interstate Commerce Commission, would go a long way towards improving the situation. Everything has been done that could possibly be done to help labor. Every restriction that could possibly be devised has been thrown about capital. The third element in all general business that seems to have been neglected is enterprise. The neglect and the ill treatment of enterprise has almost killed it, it will require very careful, constructive treatment to put new life into the third element so vital in the partnership of industry, viz., enterprise, in order that it may command capital and employ labor.

B. F. Bush, President Missouri Pacific.

(1.) My opinion is that for the first few months of 1914 the volume of business will probably not be so great as it was for the corresponding months of 1913. The determining factors as to the remainder of the year will be the *then* crop conditions and prospects, the trend of legislation, and the ability of the railroads to make necessary purchases which will greatly contribute to a revival in general and industrial activity.

The unsettled conditions arising out of legislative questions affecting finance, industry, and trade have created uncertainties in the minds of the banker, manufacturer, and merchant, and as a consequence their operations are now being conducted with extreme conservatism. Coupled with these is the inability of the railway companies, through largely increased expenses and lack of compensatory rates, to give as formerly that substantial impetus to business which results from extensive purchases of equipment and materials for the betterment of operation of their properties.

E Pennington, President, Minneapolis, St. Paul and Saulte Ste. Marie.

(1.) The prospects for 1914 do not look as good as they were in 1913.

E. P. Ripley, President, Atchison, Topeka and Santa Fe.

(1.) I think in most parts of the country it will be considerably worse; there may be here and there localities where the crops have been better. Certainly in our territory it is far from being what it was last year.

S. M. Felton, President Chicago Great Western.

(1.) The outlook for railroad business during the year 1914 is not encouraging, and unless conditions materially change, I do not look for railroad earnings to be as large as they have been for the calendar year just closing.

Daniel Willard, President, Baltimore and Ohio.

(1.) At the present time the outlook for railway business for 1914 seems less favorable than was the case a year ago.

F. D. Underwood, President, Erie.

My answer to question No. 1 is: That the volume of business will be less and the net results likewise in the calendar year of 1914 than in 1913.

C. E. Schaff, President, Missouri, Kansas and Texas.

(1.) Railway earnings in the Southwest during 1914 will, in my opinion, be less than they were in 1913.

L. E. Johnson, President, Norfolk and Western.

(1.) Does the railway business for 1914 promise to be better than in 1913, or worse?

If the Interstate Commerce Commission grants the application of the railroads for an increase in rates, I have no doubt that the business will be better in 1914 than in 1913.

H. U. Mudge, President, Chicago, Rock Island and Pacific.

(1.) The railway business for 1914 does not promise to be so good as in 1913.

L. F. Loree, President, Delaware and Hudson.

(1.) Present indications are that the year 1914 will witness a sharp recession in general business, and, of course, this will include curtailment of railway traffic. Any reduction in traffic movement necessarily involves a corresponding decrease in gross receipts and more than a proportionate diminution in net corporate income, for the reasons (a) that many expenses of a general character cannot be reduced in correspondence with reductions in traffic, and (b) that it is in the approaching period of depression that the full effect of recent compulsory increases in wages and the burden of legislative enactment will be felt. Moreover, business depression inevitably falls most heavily upon the railways, because they are subject to the exceptional requirement that at all times their facilities must suffice to move the maximum volume of traffic that may seek transportation. The consequence is that in times of depression the railways have a larger proportion than other industries of unproductive capital.

A. H. Smith, President, New York Central.

(1.) The railroad business for 1914 does not promise to be so good as the business for 1913. To be as good as 1913 there should be an advance in gross traffic of at least five per cent, corresponding to the normal growth of the country. At the present time there is no such increase in business beyond the growth of last year. On the contrary, there is a slight decrease in volume. It is quite difficult to estimate how long this situation may continue, as it is contingent upon many circumstances. In several sections of the country the fruit and cereal crops have not been so bountiful as formerly. This will be reflected in the winter and spring purchases of manufactured articles. The remedy for this must await the harvest of 1914. There appears also to be a readjustment of prices and markets, temporarily at least, to conform to new tariff conditions; and, in view of pending legislation upon currency and railroad regulation, there is conservatism among people who have money to invest.

In the end, this conservative attitude may be profitable, but for the present it means a smaller volume of business, and, in view of the substantial increases which have been made in wages during the past year, it also means somewhat less net revenue, and less employment for a good many thousand men.

Fairfax Harrison, President, Southern Railway.

(1.) The present outlook for railway business in the Southeastern states in 1914 is favorable. Except in restricted localities, affected by drought, crop yields were larger in 1913 than in 1912, and prices of agricultural products are generally good. The consequent enlargement of the purchasing power of the farmers may be expected favorably to affect the volume of wholesale and retail trade. Southeastern industries are generally enjoying a good demand for their products. It is yet too early to anticipate whether this will continue through the year 1914.

F. H. Britton, President, St. Louis Southwestern.

(1.) No. I look for it to become worse.

QUESTION NUMBER TWO.

(2) Do you expect the Interstate Commerce Commission to grant higher rates? What, to your mind, is the most conclusive argument in favor of the proposed increases?

F. A. Delano, President, Chicago, Indianapolis and Louisville.

(2.) I certainly do. The most conclusive argument is that the railroads have shown by most unanswerable figures that they need increased net revenue. It has also been shown that this must be obtained in one of two ways: either by raising rates or by diminishing expenses. Railway officials feel that while there is always room for some improvement in better methods, they are unable to stem the tide of the diminished purchasing power and increased public demands in any way except by increased revenue.

In 1910, the proposition to increase some rates, especially the so-called class rates, leaving the low-grade commodities alone, was objected to by the Commission. After considering carefully the arguments of the Commission in rejecting the plea of the carriers at that time, the railway officers came to the conclusion that their best course would be to make a general advance in rates, leaving the relation of all rates to each other absolutely undisturbed. By this action, it appears to me that the railroads have made their case when they show the necessity for net revenues, and that any interest or group of interests that claim that certain rates should not be advanced must sustain the burden of proof as to why an exception should be made.

Ralph Peters, President, Long Island.

(2.) I expect the Interstate Commerce Commission to grant higher freight rates. I think the most conclusive argument in favor of the proposed increase lies in the fact that enterprise and capital that were constantly expanding and developing the railroad lines of the country have been driven from the field, and there will be little or no new developments until more liberal treatment restores enterprise to activity and enables it to attract capital from its hiding places.

B. F. Bush, President Missouri Pacific.

(2.) The advance in rates applied for will, if granted, affect only the Eastern railways representing 21 per cent of the mileage of the country and will afford no direct relief to the greater mileage lying in the Western half of the United States.

I think the higher rates should be granted, for it has been fully established that the existing rates do not yield revenues sufficient to enable the railways to meet increased expenses and give a fair return on the investment—such "fair return" must be forthcoming before railways can hope to borrow new money for the enlargement of facilities, improvements, or extensions necessary to properly conduct the constantly increasing traffic of the country.

The most conclusive argument for the increase ought to be the moral obligation of the Government to see that the thousands and thousands of small shareholders and bondholders who have risked their private means to help to build up an industry such as the railways, which confer untold comforts and benefits to the entire nation, should be protected and receive a compensation fully as great as would result from the employment of such private means in a less beneficial enterprise. There are few classes of industry that yield such small returns as do the railroads. The most convincing argument for the increase is that for want of means—for lack of credit in financial marts—the railroads are not able to keep pace with the business requirements. If this condition continues, the loss and injury to the entire country will be beyond reckoning; commerce and the many varied pursuits arising therefrom will surely languish, and the country will be a prey to hastening ills. On the other hand, it is our heritage, provided the resources at our command are wisely applied, to attain the commercial and economic supremacy of the world, with the attendant benefits of increasing the employment of our people and adding to our national greatness and prosperity.

E. Pennington, President, Minneapolis, St. Paul and Saulte Ste. Marie.

(2.) I see no reason why the Interstate Commerce Commission should not grant higher rates. The increased expenses and depression in business are certainly argument enough for it.

L. F. Loree, President, Delaware and Hudson.

(2.) I cannot undertake to say what the Interstate Commerce Commission will or will not do concerning the application for increased rates or any other matter. To my mind, all arguments in favor of the application are subordinate to the controlling ones, viz., the absolute inability of the railways, if the application should be denied, to meet the requirements of the public as to extension and improvements in their facilities.

A. H. Smith, President, New York Central.

(2.) From the evidence already submitted to the Interstate Commerce Commission, an advance in rates would seem to be imperative. In fact, the advance requested is nominal, compared with the needs of the properties and the needs and demands of the public for changes in transportation conditions. Many of the prevailing rates are those which were established as a result of protracted and ruinous competition, and later became legal when the rates were at extreme low tide. If the Government is to regulate, it must also protect, and permit the establishment of rates which are normal, and which will permit of safe and efficient service and the further development of the country. Every dollar that railroads spend for current service some one must contribute in the form of freight and passenger revenue. For several years the rates for service have been substantially stationary, and during that time very large increases have been made in wages and in the cost of material, the practical result of which is that what formerly cost the railroads $1 now costs the railroads $1.40, but they were permitted to collect only $1 throughout that period for the service rendered. It is common knowledge that wages and costs of materials of every kind have radically advanced during the past few years, and the farmer, manufacturer, and laborer have profited in consequence; yet during this entire time the railroads have been required to sell their commodity of transportation at a stationary price. The utter impossibility of continuing such a process is the strongest reason why changes should be made in rates.

Fairfax Harrison, President, Southern Railway.

(2.) I believe that the Interstate Commerce Commission must be impressed with the importance, not only to the railways, but to the business of the country generally, of permitting the railways to make adequately remunerative charges for transportation service. To my mind the strongest argument in favor of this is found in the fact that the railways of the United States are an indispensable part of the business of the country, and that the prosperity of the farmer, the manufacturer, the merchant, and all of the people is dependent upon railway net income being sufficient to attract the additional capital needed if the increase in railway facilities is to keep abreast of the increasing demand for transportation service.

F. H. Britton, President, St. Louis Southwestern.

(2.) Do not know what to expect—hope they will grant the increase. Railroads are unable to earn anything for improvements and betterments. As matters stand now they are earning barely enough to cover their fixed charges; transportation service must deteriorate unless the carriers are permitted to earn sufficient to meet their requirements in the way of additional facilities.

E. P. Ripley, President, Atchison, Topeka and Santa Fe.

(2.) I have ceased to guess what the Interstate Commerce Commission may do. Heretofore it has done little except to deny every request made of it by the railroads. The most conclusive argument in favor of the proposed increase is that two and two have, up to this writing, always failed to make five.

S. M. Felton, President Chicago Great Western.

(2.) I cannot give an opinion as to whether the Interstate Commerce Commission will grant the increased rates applied for by the railroads. In my opinion the most conclusive arguments in favor of the proposed increases are the enormous increases in wages paid railroad employes; the increased cost of materials and supplies; the demand made by the public for superior service, and the very heavy increase in expenses resulting from legislation, both national and state.

Daniel Willard, President, Baltimore and Ohio.

(2.) I do not care to venture an opinion as to the probable action of the Interstate Commerce Commission. I think, however, the best interests of the country at large would be served by the Commission granting the five per cent increase in freight rates, as requested by carriers in Offical Classification territory. I think the most conclusive argument in favor of the proposed increase is the statement of the financial condition of the railroads, as already submitted in connection with the rate case.

F. D. Underwood, President, Erie.

(2.) To forecast the decision of the Interstate Commerce Commission in the rate advance case is impossible. The most conclusive argument in favor of the proposed increases I know is, that the railways cannot go on, with the improvements necessary for the use and benefit of the public on their present net income. If the railways have no money to spend for enlargements, the damage to general business is apparent. The proposed rate advance of five per cent works no direct hardship on any class of the people; while it is an axiom that hard times for railways works a direct hardship on many classes of the people.

C. E. Schaff, President, Missouri, Kansas and Texas.

(2.) I hesitate to predict the probable action of the Interstate Commerce Commission with respect to rate increases. To my mind, the most conclusive argument in favor of an increase is the fact that it would tend to strengthen the credit of railroads and aid the companies in securing needed credit for improving and enlarging their facilities in order to properly care for the nation's growing traffic.

L. E. Johnson, President, Norfolk and Western.

(2.) Do you expect the Interstate Commerce Commission to grant higher rates? What, to your mind, is the most conclusive argument in favor of the proposed increases?

Yes. The most conclusive arguments in favor of the proposed increases are the statements that have been sent out by the railroads and the presentation of the matter before the Interstate Commerce Commission by President Willard, of the Baltimore and Ohio Railroad, and Mr. F. A. Delano, receiver of the Wabash Railroad, with the testimony presented to the Interstate Commerce Commission in connection with this case.

H. U. Mudge, President, Chicago, Rock Island and Pacific.

(2.) I expect the Interstate Commerce Commission to grant the request for higher rates. The most conclusive argument in favor of the proposed increase is the inability of the railroads to go on furnishing the kind of service that they have been furnishing in the past unless better rates are granted. Furthermore, the large number of men who are now out of work, and the large number that will be out of work before spring, due to the inability of the railways to purchase cars, rails, and other supplies, must, it seems to me, clearly indicate that the increase asked for would be more beneficial to the country than to the stockholders.

QUESTION NUMBER THREE.

(3) Is Government ownership of railways a possibility if the Government were to show continued reluctance to permit increased rates?

F. A. Delano, President, Chicago, Indianapolis and Louisville.

(3.) Government ownership is, of course, a possibility; but I believe that it is a long way off. It is quite conceivable that Government ownership might be a good thing for the investors and eagerly sought by them; but it is quite another thing to say that it is a desirable thing for the nation. For my part, I would be very sorry to see it. Nor do I think that Government ownership is called for unless we are ready to admit that the regulation of corporations is a failure. There is no more argument for the Government ownership of railroads than there is for the Government ownership and operation of every public service, and the number of corporations whose operations "are affected" (to use the language of the courts) "with a public use" is already large and constantly growing.

If the argument is made that Government ownership should come because public regulation is a failure, it is a curious reasoning to suggest that the same instrumentality that has made a failure of public regulation should be entrusted with ownership and operation.

Ralph Peters, President, Long Island.

(3.) Government ownership of railways is a possibility, but surely, when the people of the United States serously consider the proposition and its effect upon the general government as well as on the general condition of the entire country, they cannot but decline to undertake it.

B. F. Bush, President Missouri Pacific.

(3.) If there is to be no amelioration of conditions, it would seem that depressive regulation, if persisted in, will surely wreck the railroad properties, which will inevitably lead to an attempt by the Government to operate them as their owner. Undoubtedly, the people of this country are opposed to Government ownership with all the tyrannies and oppressions it may bring, and yet they appear to be approving those policies which will render *individual* ownership so unprofitable that it will become impossible. Railway service must inevitably deteriorate by lack of adequate means to maintain it, and these means cannot forthcome from the rate schedules now in effect. Increased business will not serve the purpose, for of late years the railways generally have been operated to the limit of their facilities and extra business over and above their limits entails a disproportionately high cost. Through diminished net returns due to unremunerative rates, the credit of most of them is so impaired that they cannot secure funds to increase their facilities or make necessary improvements. Neither can these be provided for out of surplus net earnings. If the people insist that the railway service to which they have been accustomed and to which the business of the country is adjusted should still obtain, or that a higher standard of service, to meet the exigencies and demands of trade and commerce, should be inaugurated, they must understand that such service can be furnished only through the ability of the investors who back the railways to pay the bills. Under the conditions which now govern and threaten I can conceive of no investing power, through private ownership, that would stand sponsor for the bills, and therefore, booting aside its direful complications, the corollary forces the conclusion that only through Government ownership can the bills for improvements be paid.

E. Pennington, President, Minneapolis, St. Paul and Saulte Ste. Marie.

(3.) I hardly think we will ever see Government Ownership of railroads. I have too much confidence in the intelligence of the American people.

L. F. Loree, President, Delaware and Hudson.

(3.) I do not look upon Government ownership of railways as a question of practical importance in this country at this time.

A. H. Smith, President, New York Central.

(3.) Government ownership does not necessarily follow immediately the reluctance of the Government to permit increased rates. Other resources might be the decrease in the class of service furnished, decreases in wages, and a retrograde movement in the development of the country. This is something which no one wants, and it is not believable that the American people will force the railroads to such an extremity to avoid bankruptcy. If the Government or any one can devise means by which the railroads can continue to render efficient service and borrow at reasonable rates the money required for expansion, the railroads would gladly adopt the methods.

Fairfax Harrison, President, Southern Railway.

(3.) I have great confidence that Government ownership and operation of the railways will never become a fact in the United States, but that there will be a general recognition of the principle that a prosperous railway system under private management, but subject to reasonable public regulation, is the best assurance of progress in public transportation service.

F. H. Britton, President, St. Louis Southwestern.

(3.) Yes.

E. P. Ripley, President, Atchison, Topeka and Santa Fe.

(3.) The Government has it in its power to first ruin the railroads and then buy them. Whether it proposes to pursue this policy I cannot say, not being in its councils. It is certain that the present condition of things cannot continue.

S. M. Felton, President Chicago Great Western.

(3:) To my mind, Government ownership of railways is a distinct possibility if the Government does not permit increased rates.

Daniel Willard, President, Baltimore and Ohio.

(3.) Government ownership is, of course, a possibility, and very likely will become a probability, if the railroads under private control are not able to provide the transportation facilities which the commerce of the country requires.

F. D. Underwood, President, Erie.

(3.) Government ownership is always attainable at its option. The question of rates now before the public has no bearing on the ultimate ownership of railways.

C. E. Schaff, President, Missouri, Kansas and Texas.

(3.) If the policy of Government, both state and national, which has obtained during the past five years, should continue, the condition of railways will become such that the public and the owners will demand Government ownership as the only solution of the transportation problem.

L. E. Johnson, President, Norfolk and Western.

(3.) Is Government ownership of railways a possibility if the Government were to show continued reluctance to permit increased rates?
I think not.

H. U. Mudge, President, Chicago, Rock Island and Pacific.

(3.) Government ownership is not only a possibility, but a certainty, if wages and all other commodities are to go up in price and the price of transportation remain stationary, or be reduced, as it is being done continually.

QUESTION NUMBER FOUR.

(4) Do you approve or disapprove of the Government's plan for physical valuation of the railroads?

F. A. Delano, President, Chicago, Indianapolis and Louisville.

(4.) I disapproved of it for a number of years, and finally gave my acquiescence to it because I regarded it as a public demand, and not because I regarded it as very desirable. I think that the public will be very much disappointed when it finds out how little has been accomplished by reason of the physical valuation of railroads. It is generally admitted now that it will be very expensive and will cost—depending on the methods adopted—somewhere from $5,000,000 to $10,000,000, half or two thirds of which will be borne by the railroads, and the remainder directly from public funds. The most that can ever be expected as a result of such a valuation will be to determine whether railroads are earning a net return on their physical valuation. Having determined this, it will still be impossible to tell whether rates as a whole should be advanced, or what rates should be advanced; and in some cases it would even be a matter of judgment as to whether by reducing some rates and improving methods, better results might not be obtained. The valuation of a railroad has never played any part whatever in fixing rates heretofore, and it cannot in the future, except in most general terms.

Ralph Peters, President, Long Island.

(4.) I approve of the general plan for the physical valuation of the railroads. A fair valuation will make the people realize how much better off they are, and how much more has been done for them by the tremendous investment of private capital in the business of railway transportation. We are fully co-operating with the Commission in their efforts to secure a true valuation of the railroads.

B. F. Bush, President Missouri Pacific.

(4.) I cannot see that the Government physical valuation plan, when consummated in five years or more, will meet the expectation of its framers. It certainly imposes a burden upon the Government and the railways of many millions of dollars, and in this way will be a vast economic waste. If its design is to predicate the rates that shall be charged upon the valuation determined, I bespeak for it complete failure. Individual rates, on the thousands of commodities carried by railways in varying quantities varying distances, never have so long as the existing inexorable conditions affecting national and international commerce remain in force. Besides, the billions of varied rate transactions yearly would render impracticable any plan having for its object a fixed mathematical relation of one rate to the other or to the valuation of the property when determined, as is contemplated by such an impracticable scheme.

After a careful study of the subject by competent authority, it is generally conceded now that the value of the physical plants of the railways is much in excess of that represented by the securities outstanding, yet the rates permitted are not sufficient to yield a fair return on such undervalued securities. The chief objection to this physical valuation plan, however, is the enormous expense it will entail by reason of the work required by the Government to aid it in determining the valuation, without compensatory or other benefits of any character to the railways.

S. M. Felton, President Chicago Great Western.

(4.) I do not approve of the Government's plan for physical valuation of the railroads; first, because it places the burden of a large portion of the expense upon the railroads; second, because it is a debatable question whether the physical valuation when made under the plan promulgated by the Interstate Commerce Commission will represent a fair value of the property, and the time it will take to make these valuations will render the figures of doubtful value, owing to the fact that it will be impossible to bring them down to date.

Daniel Willard, President, Baltimore and Ohio.

(4.) Probably, upon the whole, it is a good thing to have a Federal valuation of the American railroad system. Undoubtedly, it will show that the railroads are not only worth as much, but more, than their existing capitalization, when considered as a whole. I do not expect, however, that the railroads will be permitted to advance their charges, because of that fact; and, if I am right, nothing will be gained by a physical valuation to use as an argument for reduced rates. The task is enormous, and will cost a large sum of money, and, as I view it, will be of no practical value when finished, beyond the fact that it will without doubt dissipate the belief which seems to exist in many quarters that American railroads as a whole are over-capitalized.

F. D. Underwood, President, Erie.

(4.) Physical valuation of railways as a basis for taxation is not essential:

First: For the reason that their physical value is a varying thing. By the time the valuation is completed, it will be obsolete. As a taxing basis the physical or intrinsic value of a railway should not be a governing factor.

A better basis for taxation is a percentage of the gross receipts. The data for this method are already in the hands of the state and federal authorities and are simpler, quicker, and a fairer plan of producing revenue than by the roundabout, laborious one of physical valuation.

Second: As a rate-making basis, it is superfluous, the rate-making power being now in the hands of the several state commissions and the Interstate Commerce Commission. Rates by all lines are the same, regardless of their individual costs or value, all the communities now being (or to be) on the correct basis, i. e., what the traffic will bear; the cost or intrinsic value of the transportation machine is irrelevant.

C. E. Schaff, President, Missouri, Kansas and Texas.

(4.) The plan for Federal valuation of railways is not objectionable. I doubt whether the result will justify its great cost, but it is certain, at any rate, to put at rest the charge so frequently made by persons ignorant of the conditions that American railways are over-capitalized.

L. E. Johnson, President, Norfolk and Western.

(4.) Do you approve, or disapprove, of the Government's plan for physical valuation of the railroads?

We are working in harmony with the Government in the plan for the physical valuation of the railroads. Time only can tell whether it will be beneficial or not.

H. U. Mudge, President, Chicago, Rock Island and Pacific.

(4.) I neither approve nor disapprove of the Government plan for valuation of railways. It is conceded by every authority that if such valuation were to have any effect on rates, it would necessarily increase them, but it will have no bearing, because the great difference in the physical cost of competing lines precludes any possibility of fixing rates on such valuation. The only objection to it from the railway standpoint is the expense of making such valuation.

E. Pennington, President, Minneapolis, St. Paul and Saulte Ste. Marie.

(4.) I cannot see where the physical valuation of railroads is going to be of any benefit to any one. I do not see how it can be used for rate-making or for taxes.

L. F. Loree, President, Delaware and Hudson.

(4.) The results of the Federal valuation of railway property now in progress will undoubtedly serve the useful end of effectually refuting the charges of over-issuance of securities that have passed current for so many years. They will show that the real value largely exceeds the aggregate par value of all outstanding securities. The valuation, however, will furnish nothing of assistance in the determination of reasonable rates, if only for the reason, among others, that the public would not concede the large increases that would have to be made in order to enable many lines which perform necessary services to earn the confiscatory minimum rate upon their values, as disclosed by the inquiry.

A. H. Smith, President, New York Central.

(4.) The Government plan for a physical valuation of the railroads appears to be not thoroughly understood at the present time. The act provides, apparently, that the original cost shall be ascertained. This appears to be difficult, if not impossible, because the present railroad systems are consolidations of thousands of small companies, the identities and construction data of which have been largely lost. There is, therefore, no probability of ascertaining the original cost of the properties as now constituted. Again, the act provides for an estimate of the cost of reproduction of the present properties, with depreciation, etc., all of which involves many assumptions as to the conditions which surround the railroads and which the railroads themselves have created. The investigation, however, in its entirety, we believe, will tend to show that the railroads as now constructed are of far greater value than the present par or market value of the securities they have issued, and this conclusion we believe will be beneficial, because it will restore confidence in the integrity of railroad investments.

Fairfax Harrison, President, Southern Railway.

(4.) The proposed Federal valuation of the railways, if made on a fair basis, should have the effect of correcting the widespread mistaken assumption as to a disproportionate relation of the capitalization of the railways of the United States, as a whole, to their value.

F. H. Britton, President, St. Louis Southwestern.

(4.) Approve physical valuation plan, as I believe the results will show that the railroads are entitled to an increase in freight and passenger rates.

E. P. Ripley, President, Atchison, Topeka and Santa Fe.

(4.) I can see no possible good in spending twenty millions of dollars for the sake of finding out something which is not worth finding out, and the knowledge of which, even if correctly ascertained, could have no possible use except to demonstrate that the present capitalization of the railroads is under rather than over their cost. But of what use is such a demonstration if the Government is to purchase the properties, or of what use is it in either case?

QUESTION NUMBER FIVE.

(5) What special points impress you as favorable or unfavorable in the railway situation?

F. A. Delano, President, Chicago, Indianapolis and Louisville.

(5.) The railroad subject has been thoroughly gone into in recent years, and no case has been so fully presented before the Commission as the present rate advance case. It has been a campaign of education and it seems probable that a better understanding of many problems will result from this thorough ventilation of the subject. From this I confidently hope that with this better understanding of the question will come a fairer treatment.

Ralph Peters, President, Long Island.

(5.) The special point that impresses me as favorable in the railway situation is the fact that the press is beginning to realize the seriousness of the situation, and is trying to give the truth and the honest facts to the public. When this is done, and the public understand and appreciate the real condition, the railroads will get fair play.

B. F. Bush, President Missouri Pacific.

(5.) The unfavorable are outlined in the foregoing. The favorable are found in the appearing evidences of the growth of a broader, fairer and saner public sentiment toward the railroads. It is hoped that this may—indeed, I am persuaded that it will—expand and culminate in such Governmental action as will relieve the railways from the hardships under which they are now laboring, and thus disperse the lowering cloud which presages embarrassment to many of their properties, to the commerce of the country, and to the peace and welfare of our entire body politic.

L. F. Loree, President, Delaware and Hudson.

(5.) The justifiable apprehensions of railway officers are based upon continued legislative action in violation of the fundamental rule that economic control and economic responsibility must be united. The progressive separation of these elements under laws taking from the owners of the properties more and more of the degree of control over rates and operating methods which ownership formerly implied, though these owners must still accept all losses resulting from insufficient rates, unwarranted increases in wages, or the employment of an excessive number of men, seems to be unwise from either the economic or the political point of view. The lack of public protest against the immoral actions of the Postoffice Department, under which the railways have been forced for years to carry the mails at ruinously low rates, and, more recently, to take over the transportation of the parcels post traffic, with compensation for only a beggarly fraction of its total, points to a disregard, when railways are concerned, of ordinary principles of fair dealing and common honesty that is not less than ominous.

Daniel Willard, President, Baltimore and Ohio.

(5.) This question cannot be properly discussed within the proper limits of this communication.

F. D. Underwood, President, Erie.

(5.) One of the unfavorable features in the railway situation is the forced employment of superfluous men. This fact should not be confused with that of wage advances. Wage advances are not an unmixed evil; superfluous men on railways are. Demoralization, with resultant poorer service to the public, from the evil of idlers, especially in railways, is an obvious fact.

The public is hurt when non-essential men are kept on, and essential men, necessary for the better conduct of the business, are laid off. This is unfair at the start, and will in the end lower the efficiency of railways. Pressure of public opinion, exerted through its chosen representatives, presents the only way in which it can be remedied.

C. E. Schaff, President, Missouri, Kansas and Texas.

(5.) To my mind, the favorable feature in the railway situation is that people are discussing it with greater understanding and with more apparent fairness. The specially unfavorable feature is the inelasticity in railroad operation enforced by the requirements of law and the demands of the public for service and of labor organizations for wages and working conditions, which make it almost impossible for railway managers to adjust their expenditures to declining earnings.

L. E. Johnson, President, Norfolk and Western.

(5.) What special points impress you as favorable or unfavorable in the railway situation?

The special point unfavorable in the railroad situation is our inability to earn a sufficient amount of money to meet the requirements of the public, increased taxes, and demands of labor.

H. U. Mudge, President, Chicago, Rock Island and Pacific.

(5.) There are no special points that seem to be decidedly favorable in the railway situation, although the fact that thinking people are beginning to take some interest in the subject is a favorable sign for a more constructive policy toward the railways. Business men and shippers are beginning to see that the policy of "revenge" for the past sins of the railways is not getting them what they need.

A. H. Smith, President, New York Central.

(5.) The favorable points in the railway situation appear to be that the railroads and the people, as represented by the Government, have no widely divergent opinions as to railroad regulation. The major portion of the national regulations thus far enacted has upon the whole been helpful. Further national regulation as to the purposes for which securities shall be issued, and as to the application of their proceeds, might be helpful, not only from the public's and investors' points of view, but also as tending to avoid conflicting views of the various existing state commissions. Such questions, for the common good, it would seem, might be disposed of by mutual discussion between the railroad operators and the Government, and thus avoid further political discussion of railroads, which is causing many misunderstandings and misgivings.

The American railroad is the second largest factor in the industrial wealth of the country. It pays the highest wages and gives the best service at the lowest price of any extensive railroad system in the world. The continued prosperity of this country must depend largely upon a continuation of this efficiency, which is utterly impossible without the good will and co-operation of the people and the Government. In the end it is believed that the American people have too high a sense of fair play and too much commercial foresight to permit any other policy to continue long.

Fairfax Harrison, President, Southern Railway.

(5.) In my opinion the most unfavorable factor in the railway situation is the tendency of railway-operating costs to increase more rapidly than revenues. On the other hand, the most favorable factor in the situation is the growing appreciation, on the part of the general public, of the universal interest in the railways and of the economic necessity for such a relation between railway earnings and operating costs as will enable the companies to provide increased facilities as they may be needed.

F. H. Britton, President, St. Louis Southwestern.

(5.) See nothing especially favorable—the situation in general might be called unfavorable.

E. P. Ripley, President, Atchison, Topeka and Santa Fe.

(5.) There is little that is favorable except that the rigid rules laid down by the Interstate Commerce Commission have, to a certain extent, done away with some of the wastefulness of competition; there still remains much waste, due to the crudities of the law itself, which attempts to both force and forbid competition among the carriers.

S. M. Felton, President Chicago Great Western.

(5.) The only point in the railway situation that impresses me favorably to-day is the growing disposition of the public toward fair treatment of railroads.

Fundamental Principles Touching Upon the Proposed Advances in Freight Rates

By William A. Robertson,
Of the New York Bar.

NO proceeding that is now pending in the United States—be it legislative, executive, judicial or diplomatic—is nearly so important to the general welfare as the application of the trunk lines for permission to make a moderate advance in thteir freight rates. Even the Mexican situation is far inferior in real importance to the questions raised before the Interstate Commerce Commission by President Willard, of the Baltimore and Ohio Railroad, and his colleagues. In saying this, we do not exaggerate a particle, because no situation that Mexico seems likely to create for us, short of war, can be measured against the necessity that our great highways of commerce shall be able to develop and expand, at the same rate as the business of the country. As for an actual war with Mexico, we need hardly be uneasy; for it is manifest that President Wilson has, very wisely, both the desire and the ability to prevent it. With good reason, then, do we assert that the rate question concerns our true interests far more deeply than Mexico.

It is not the purpose of this article to anticipate or to summarize the usual statistical facts and arguments in favor of the contentoin of the railroads. It rather seeks to draw attention to some aspects of the rate situation which are general and fundamental, and which do not involve an inquiry into the minutiae of rate-making. We particularly wish to emphasize the following:

1.—The Power to Forbid Rate Advances Is an Experiment in American Federal Legislation.

That portion of the Act of June 18, 1910, (the Mann-Elkins Act) which allows the Interstate Commerce Commission to suspend or forbid an advance in railroad freight rates is a novelty and more or less an experiment in the legislation of our Federal Government. We believe that it represents the first attempt to directly control the price of a commodity.*

William A. Robertson.

We use the term "commodity" advisedly, for transportation—the ability to move goods from one place to another—is quite as much of a commodity as gas or electricity. To be sure, it is as impalpable as either, but in its results it is as solid and obvious as a ton of pig iron or a bale of cotton. That the cotton was at Mobile last week, but is at Fall River to-day, is not an abstraction or a theory, but a very solid and undeniable fact, obvious to the dullest of intellects. The ability to move the cotton from Alabama to Massachusetts is almost as important as the cotton itself. Each one is a commodity, in a true sense.

Three years ago, our general Government decided that it would extend its control over the price, not indeed of the cotton, but of the labor which moves it across the country. If we overlook a few rare and occasional statutes, passed in time of emergency,—such laws as those which sought to regulate sales of gold during the Civil War—we shall find that the United States Government has never before sought to directly and arbitrarily fix a maximum price for an article of trade. The Act of June 18, 1910, must therefore be considered an exception to the spirit and policy of more than a century of legislation. It imposes an absolute bar and prohibition upon the doing of that which, in all other branches of industry, is the natural and unchallenged right of the humblest pedler or huckster, i. e., the right to charge whatever he sees fit for the wares he has to sell.†

---

*In one sense, our various tariff acts may be said to have affected prices of certain lines of merchandise. Such control, however, was entirely indirect, the price of an article being still subject in a great degree to market fluctuations. The effect of the Mann-Elkins act, however, is to create a hard and fast maximum limit, above which the price of transportation shall not go, unless with the consent of the United States Government, represented by the Interstate Commerce Commission.

It seems fair, therefore, to call it experimental legislation, since it covers a new and untrodden road, the outcome of which is yet to be seen.

2.—The Refusal to Permit an Advance in Rates Is Not Subject to Appeal or Review.

In the second place, this great power which the Commission possesses over the railroads is one that is not practically, subject to any appeal or review. The seven gentlemen who compose the Interstate Commerce Commission wield an authority far greater, for certain purposes, than many a prince or potentate. Should they say "no" to the petition of the railroads, they say it with the knowledge that there is no tribunal in the land which can reverse them and say "yes." But it is otherwise if they allow the desired advance; for such an allowance is not a final adjudication of the propriety and reasonableness of the new rate. Any shipper who might be dissatisfied with such rate might contest it before the Commission in the same manner in which he might contest any existing rate.

3.—The Absence of Definite Rules by Which to Judge of the Reasonableness of an Advance in Rates.

Again, the law does not lay down any clear or well-defined set of rules by which the Commission is to be guided in determining whether it shall grant or deny a petition for an advance in rates. On the contrary, it is perfectly well-known that there are many and complex elements entering into the question. The weight and importance to be attached to each element is something about which it is easy to differ, so that, practically, the whole subject of rate advances rests entirely within the discretion of the Commission. Unlike a suit in law or equity, there are few rules that can be invoked as precedents, to act as finger-posts and point the way out of the woods, and swamps of doubt and confusion, and on to the highway of progress and prosperity.

Now, do not all these things create the very situation where a wise tribunal will be disposed to make very sparing use of its great and extraordinary powers? A law that is new and experimental should surely be applied with caution. Especially should this be done in the case of a statute which undertakes to control prices. Every argument based on history, experience and common sense suggests that such a vast and far-reaching power should be exercised reluctantly. It is an "*emergency*" power, only to be invoked in a clear case of abuse—a case of real emergency calling for sudden and effective restraint. As wise men and as readers of history, the Interstate Commerce Commissioners doubtless know that no government in the past has been strong enough or wise enough to permanently control the price of any commodity of importance. Whenever there has been an attempt on any large scale to exercise such control, and to make the price something quite different from what it otherwise would be, there has been either a flat and mortifying failure, or else a successful evasion, or, in the last analysis, an arrested development of the particular trade or industry affected by the regulation. Indeed, we know of but one government in modern times which was able to enforce price regulation at all, and that only for a limited time. We refer to the notorious Committee of Public Safety during the French Revolution. By acts of the purest tyranny, it did indeed compel the Paris shopkeepers to sell goods at prices fixed by the Committee. Its methods, however, were intolerable, and need not here be considered.

It is quite possible, however, that, to some, the course of action now advocated may seem too moderate, even tame and weak. If so, let such critics forget for a moment about railroad freight rates, and imagine that the question at issue before the Interstate Comerce Commission was the propriety of an advance in the price of steel or cotton or wheat or potatoes. Would it not at once become apparent that no one of these commodities stood alone, but that it carried with it a dozen other questions! Take, for instance, the question of what would be or should be a "*reasonable*" price for a bushel of wheat. Apart from the actual price of wheat in the markets of the world, would it not be neecssary to consider such questions as the cost of farm land per acre, the cost of fertilizer, the cost of plows, harvesters, reapers and threshers, the wages of farm laborers, the rate of interest on money, etc., etc.? Now, if the Commission had no control over the price of any of these things, but its authority was confined to the one question of the approving or forbidding an advance in the price of wheat, is it not clear that the wise course for the Commission to adopt would be to refuse to interfere at all, unless the proposed advance in wheat was manifestly unreasonable or extortionate? If the Commission assumed to forbid a moderate advance, it might very well happen that, being unable to control the cost of the many elements that enter into the production of wheat, its refusal would place the wheat farmers at a disadvantage compared with other lines of industry, and this in turn would check the production of wheat generally. In other words, the prices of all commodities are so closely related and so inter-dependent upon one another, that no government can safely interfere wth one without risk of checking the growth and development of that entire line of industry. The action of the Government should be invoked only in a real emergency, and to prevent an irreparable injury growing out of a manifestly unreasonable and extortionate advance.

4.—The Railroads Should Not Be Forced to Prove Their Case Beyond a Reasonable Doubt.

It is earnestly to be hoped that the Commission will not require the railroads to prove the propriety of the desired advance in rates beyond every reasonable doubt. The law simply says that the burden of proof shall be upon the roads, and a fair preponderance of proof is all that should be required. If any other rule be adopted, it is doubtful whether, considering the number and complexity of the questions involved, it would be within the ability of any man to overcome the multitudinous and often captious, though plausible, objections which the self-interest or selfishness of the shippers or the public may suggest. Suppose again that, instead of the railroads being the petitioners, the farmers of the country were obliged to ask permission to raise the price of wheat, corn and oats. What a storm of protests and objections would be made! Would we not hear much about the high cost of living, and would we not be told that the price of the people's food —the very staff of life—should not be increased, that multitudes simply could not pay an enhanced price, etc.? In particular, would not eager objectors claim, with much reason and force, that American farms are not wisely managed, that farmers are wasteful and unprogressive, and that enormous economies could be practised, if the farmers would but do so,—economies which would render the proposed advance in the price of grain altogether needless? Would we not be reminded that, in the United States, with its almost virgin soil, the average annual yield is only about 14 bushels of wheat to the acre of ground against old England's 32; that in oats the United States produces an average annual yield of only 23.7 bushels against England's 42 and Germany's 46? All this and much more would be urged against the farmers as they stood at the bar of the commission pleading for permission to raise their prices of grain. In fact, it would probably be impossible for them to make out a case, if they were required to fairly prove every inch of their way.

---

†The power to suspend or forbid rate advances may perhaps best be compared with our usury laws. These are attempts on the part of our State governments to fix a maximum charge for the use of money. How far they have accomplished their purpose is an interesting question.

And would not this condition of affairs be substantially true,—at least, in part,—of almost every important industry in our land? Is not everyone of them somewhere open to criticism so that, if it were compelled to make an absolute demonstration of its right to an advance in prices, before such advance could be actually put in force, it would probably fail in the attempt, and would have to submit to a Scotch verdict of "not proven"?

Indeed, our American railroads are by far the most efficiently and economically managed industries in the country. They are not faultless, but they have been subject to such vigilant public criticism and such drastic legislative control in the last fifteen years, that they are probably much less open to attack than the average industrial or agricultural concern.

But it may be objected that if all this is so, it is but an argument against any advance in prices in any line of industry. Should anyone view it in this light, it is but necessary to remind him that our Government has very wisely refrained from attempting so vast and impossible a task as the general control of all prices, including the price of that element which enters so largely into every finished article,—labor. The great world of business, outside of the one industry of transportation by rail, is left free to regulate prices as it sees fit, subject only to existing business conditions and the laws of supply and demand. The country has achieved its industrial progress in its own way, not according to logic, but in response to the varying needs and opportunities of the times. Its growth, like all true growth, has been spontaneous, and not by rule.

But if a rule is to be applied to the railroads, quite different from anything heretofore known, and different from that by which all other industries proceed, then the position of the railroad business is at a manifest disadvantage. Is it to be compelled to justify, by a most rigid test, every advance which it seeks to secure in its rates? If so, we must expect to see the development of the railroads lag behind the country in general. Capital can not be attracted to an industry which is under some special disadvantage, unless there be some great and effective compensation, as an offset. The very merchants and manufacturers who, in 1910 and 1911, appeared at the bar of the Interstate Commerce Commission to object to the contemplated advance in freight rates, as then proposed, could not, in all probability, have justified the advances which they themselves had made in the prices of their own commodities in the preceding ten years, had they been forced to undergo the same rigid scrutiny, and the same exacting tests of economy which they were so keenly anxious to apply to the railroads. They would have been embarrassed by the old rule—"With what measure ye mete, it shall be measured to you again." Yet this is a rule of the very highest authority, and lies at the basis of all our American law, which seeks the ideal of equal treatment for all.

Of all the many powers vested in the Interstate Commerce Commission, none calls for more delicate handling or more unerring judgment than the power to suspend or forbid advances in freight rates. Upon the wisdom with which the Commission discharges this great task, rests the success or failure of the whole plan to regulate commerce. For our own part, we believe the present Interstate Commerce Commission is fully equal to the occasion, and will rise to the great opportunities which are before it. But the eyes of all the country are upon it—railroad men, shippers, manufacturers, investors, statesmen, economists and calculators. All are watching earnestly. Indeed, in a certain sense, the Commission itself is on trial, for there can be no greater or more searching test of any man or body of men than their use of power. And the true test of power is the test of time. Beyond the exigencies and expediences of the passing hour is the question of how far a rule of action will stand the test of years—how it will work as the country advances and progresses. "Time is the old justice that tries all men."

"Knockers"—Attention!

IF you work for a man, in Heaven's name WORK FOR HIM. If he pays you wages that supply your bread and butter, work for him; speak well of him; stand by him and stand by the institution he represents. If put to a pinch, AN OUNCE OF LOYALTY is worth a pound of cleverness. If you must vilify, condemn and eternally disparage, why, resign your position and, if you are a weakling, when you are outside damn to your heart's content; but as long as you are a part of the institution, do not condemn it. If you do, you are loosening the tendrils that hold you to the institution, and the first high wind that comes along, you will be uprooted and blown away, and probably you will never know why, as many have experienced."—Elbert Hubbard.

Where Do Our Railroads Stand?

REMARKS OF IVY L. LEE, EXECUTIVE ASSISTANT, PENNSYLVANIA RAILROAD COMPANY, BEFORE PITTSBURGH TRAFFIC CLUB, DECEMBER 8, 1913.

EDITOR'S NOTE.—Owing to the non-receipt of the full copy, it was only possible to publish in the December issue a brief abstract of the following interesting statement. Mr. Lee's summary of the increased burdens which the roads are now compelled to carry and which have resulted in enormously increasing their operating expenses, is most impressive. He refers particularly to the additional expenditures caused by floods, increased wages, higher taxes and expensive legislation and regulation, all of which are developments over which the railroads have had no control.

My topic is "Where Do Our Railroads Stand?" This topic was of my own choosing, but after having suggested it to your committee and thinking the subject over, I have come more and more to the feeling that our railroads are not standing at all. They are more in the condition of a prize fighter who has been knocked down and over whom the referee has already begun his count. We see signs of animation in our gladiator and there is every indication that he will come back and be ready for more rounds. But there are also numerous signs that if he continues to receive the same kind of jabs, upper-cuts and solar plexus blows which lately have been so freely thrust at him, the occasion may rise when his reserve strength will have been exhausted.

Those of you who have ever attended a prize-fight will remember that uncanny—almost demoniacal shout of delight which seems to go forth from the crowd when the "mixing" is most furious and a "knockout" is imminent. So, too, we seem to have been hearing sounds indicating the exultation of the unthinking at the plight of the railroads. We read in some of our magazines expressions apparently enthusiastic that now has Daniel come to judgment, that our railroads are but debris, demoralized wrecks of departed confidence, and that Government ownership should be availed of immediately to save our people.

We who listen to these extraordinary outbursts cannot but wonder at the apparent absence of reason and lack of understanding which is thus displayed. So far as we can learn, about the only basis for this strange destructiveness seems to be the fact that at some time in the past the crowd knew that this railroad champion had sown some "wild oats." For, to drop the metaphor, I feel safe in saying that no business in the United States is to-day conducted with greater regard not only for the requirements of the law but for the fundamental dictates of honesty and decency than that line of public service to which railroad officers are devoting themselves.

I.

BURDENS FROM WHICH RAILROADS SUFFER.

Let us consider some of the blows which are being aimed at the body of this champion who is, as I conceive it, fighting for public prosperity:

Floods.

1. The most recent, but none the less serious of these destructive forces was the flood of last spring which cost the railroads some $12,000,000, and which caused a charge of upwards of $4,000,000 against the revenues of the Pennsylvania Lines. This sudden invasion upon our property had to be met out of that surplus which it should be the part of every well managed railroad to have available, and yet the accumulation of which is made increasingly difficult by the tendency of present-day legislation.

Increasing Wages.

2. Wages are constantly going up. If the railroads which are now seeking to increase their freight rates had employed the same number of men in 1910 as they did in 1913, the wages paid by those particular companies in the latter year would have been greater by $48,000,000 than in 1910. The companies of the Pennsylvania Railroad System paid out last year $189,000,000 in wages; and the rates of pay for last year were upon a basis 37 per cent higher than those which prevailed in 1901. While believing that railroad employes should be liberally paid, we have an equal obligation to insure proper and equitable treatment to all classes of employes. The effect of some of the wage arbitrations, however, which have recently taken place, has been to create an unwarranted disparity between the wages of different classes of employes by making additions to wages already unduly high and rendering difficult if not impossible proper treatment for employes as a whole.

Taxes Going Up.

3. Not alone wages, but taxes also are mounting upwards. The taxes for the companies in the northeastern quarter of the United States have increased 111 per cent in the past ten years. In this manner the railroads not only suffer the brunt of the increasing costs of their own operations, but they must share a large portion of the constantly increasing expenses of our agencies of government.

Expensive Legislation.

4. Not alone must these increases in wages and taxes be met, but our railroads are shouldered with a mass of legislation the result of which is to augment the expenses of operation. Extra crew laws loom large in this category. These laws have not only added some $6,000,000 to the cost of operation in the states which have them, but, worse than that, they have imposed upon the railroads an obligation to employ a large number of men who are not needed for either the safe or the efficient operation of trains. A short time ago, while journeying between Richmond and Indianapolis, walking through a sleeping car I saw the conductor of the train sound asleep. This was in one of the extra crew law states. The train was one which made very infrequent stops, and it was quite evident that the conductor did not have enough to do to keep him awake.

We have grade crossing laws such as that recently passed in the state of New Jersey, imposing upon the railroad the entire burden of the cost of removing a grade crossing; and yet, if the grade crossings on the Pennsylvania Railroad alone in the state of New Jersey had to be removed at once, the cost would be at least $60,000,000.

Let me not be understood as protesting against any of this legislation. All of it may be highly desirable; but that it is expensive and that the expense must be met from some source there certainly can be no question.

II.

WHY THE BURDENS ARE SO HARD TO CARRY.

Faced with the necessity for meeting such expenses, the railroads nevertheless find themselves surrounded by many anomalous conditions which prevent normal treatment of the situation. You will remember that when Gulliver was shipwrecked on the shores of Lilliput, the little inhabitants of that country bound his arms and legs with ligatures which made difficult his freedom of movement. So we find that our railroads have been bound around with certain ligatures which, to return to the figure of the prize-fighter, make it impossible to dodge or to ward off the blows which have caused his dismay. Such ligatures are:

Different Tribunals for Wages and Rates.

1. The fact that the tribunals which settle the wages which we shall pay to our men are not the same as those which have jurisdiction over the rates we shall charge for our services. If a railroad brings to a commission a statement as to its increased payments for wages there is nothing whatever in law or in logic to prevent such commission from saying that such a schedule of wages is unwarranted and that upon the general public ought not to be imposed the burden of paying for it.

Federal and State Conflicts.

2. The fact that state legislatures may enact measures imposing increased expenses and yet by reason of the inter-relationship between state and interstate rates, the national government, through its control over interstate rates, in effect if not in act prevents an increase of rates to meet the expenses incident to carrying out the legislation of individual states.

Compelled to Compete and Not to Compete.

3. We are compelled by the Sherman Act to compete; and yet, under the Hepburn law, in substance forbidden to compete with other railroads. The Hepburn law, by requiring us to file all rates thirty days before they become effective, practically insures that the rates over all railroads between two points shall be the same. This same law forbids all discrimination by one railroad or a group of railroads against individual shippers, classes of shippers, or communities. Thus though competition in all respects save service is effectually prevented, and though we are subjected to the most rigid regulation, the national Congress, in spite of the recommendations of two Presidents of our country, still refuses to permit competing railroads to make legal agreements with one another. The situation of the railroads in this matter may not be inaptly compared to that of the little girl, who, being told to learn to swim, was yet adjured by her mother:

"Now go, my darling daughter,
Hang your clothes on a hickory limb,
But don't go near the water."

The natural result of competition is the survival of the strong. And yet if in practice competition results in the crippling of the weak, the result is not considered desirable. We are told that there should be competition between railways and waterways, and yet if in practice we find that even with their cheaper rates the waterways cannot meet the competition offered by the superior service of the railroads, and the waterways in consequence languish, we are told once more there is something wrong with the character of the competition.

Conflict Between Law and Business Custom.

4. The railroads are constantly urged to consider business interests, and to adjust their dealings to the commercial needs and habits of the people; and yet they are often compelled by law to do uncommercial things. If a Pittsburgh lumber dealer undertakes a contract, with prices based upon a rate quoted to him by a railroad rate clerk in Pittsburgh, and it is later found, after delivery of the lumber, that the rate was, in the utmost good faith, quoted inaccurately, the legal rate must nevertheless be collected, even if it should mean the bankruptcy of the lumber dealer. This situation has been met in the Pennsylvania public utilities law:

> "Article III, Section 7, paragraph (a)—"Whereas, as the result of a bona fide mistake or error of a common carrier, the full tariff charges are not collected in the first instance, and the balance is subsequently found to be due and outstanding, the collection of such balance may be waived by the carrier, provided the matter is submitted to the commission, and its approval of such waiver is first had and obtained."

but is still controlling with reference to interstate shipments.

Pressure is continually being exerted urging railroads to pay all claims promptly; and yet there is constant risk that the inadvertent payment of an unwarranted claim may result in an indictment charging the payment of a rebate.

Demand for Passenger Service and Low Fares.

5. There is a continuing demand for improved passenger service, for both speed and safety in the operation of trains, and for greater comfort and cleanliness in the equipment provided. Yet a large number of states have passed laws restricting passenger fares to a maximum of two cents a mile, with but little consideration given to whether that sum is fair payment for the character of service demanded.

Contradictory Local Demands.

6. We are often between two fires presented by contradictory local demands. There is at many points, for instance, a very strong sentiment that railroads should provide switching from the lines of one company to another at nominal rates. There is at the same time a demand for improved terminals. The point is almost invariably over-

looked that if the existing terminals of a railroad are not to be protected against use without full compensation, the very strongest incentive is immediately removed for that carrier to expend additional capital in improving its terminals.

Inadequate Pay for Carrying the Mails.

7. The railroads are in a strange dilemma with reference to the transportation of the mails. The Supreme Court of the United States has declared that the railroads are not compelled to carry the mails. And yet if they do carry them, they must do so at rates and under rules laid down by Act of Congress. No thinking man will fail to realize immediately that the railroads could not seriously consider refusing to transport the mails. The inconvenience to the public would be so great that no railroad company could assume the responsibility for causing it. If the railroads were compelled by law to carry the mails, and they then found that the rates fixed by Congress were not compensatory, the companies would have some standing before the courts in claiming that their property was being taken without just compensation. But under the law as it stands they must, in deference to public opinion and public convenience, accept as nominal free agents contracts with the Postoffice Department to carry the mails upon terms established by Congress. They have no standing before the courts, and their only appeal for adequate payment lies to public opinion.

This is the day of enlightened public opinion, and we are all impressed with the point of view from which all matters of business and social conduct are being regarded. Righteousness is these days receiving an emphasis certainly without precedent in our time, and the Government is interposing continually to insure that righteousness shall prevail in the treatment of the people by incorporated capital.

I should like to lay before you, however, a chain of facts in this matter of the compensation paid by the Government for carrying the people's mails, and leave with you the question as to whether, in these, are embodied practices comporting with the highest ideals of righteousness.

Our Government instituted the parcel post January 1st, 1913. Notwithstanding the fact that this parcel post was expressly designed to provide a service which would compete with that of the express companies, and that from this express traffic the railroads received a portion of the revenue, no provision whatever was made to pay the railroads for carrying the burden of this parcel post for the first six months. After the first six months it was provided that the Postmaster General could pay not exceeding five per cent to those railroads upon which the mails had not been weighed between January 1st and July 1st, to compensate them for carrying the parcel post. At the time such provision was made the weight limit of the parcel post was 11 pounds. On August 15th, however, without further provision for compensating the railroads, the weight limit of the parcel post was extended to 20 pounds. And still with no provision made for the compensation of the railroads for the additional burden which they must carry. The weight limit is on January 1 to be further increased to 50 pounds without any action before then to pay the railroads for carrying the additional weight. And it was stated in newspaper articles sent out from Washington a few days ago that the only complaint which had been made against increasing the weight limit of the parcel post came from the railroads!

The situation is described perhaps with exaggeration, but vividly, by a narrative I heard recently of a man who had wished to forward a small package. He found that the charge for carrying that package by freight would be 25 cents, by express 26 cents, and by parcel post 24 cents. The man reflected that of course the principal portion of the journey which that parcel was to have would be by railroad, and he therefore took occasion to inquire what payment the railroad itself received for carrying that package by each of the respective methods. His conclusions he thus stated:

"I found that in the case of freight the railroads received the whole of the revenue; in the case of the express, they received half of it; and in the case of the parcel post, they received none of it."

Public opinion has for many years past seemed to make it popular for postoffice officials and others to consider only the convenience and immediate purposes of the Department, rather than the question of insuring that fair payment should be made to those carrying the mails.

And, for the present, the fact remains that the mails are being carried without adequate compensation, and the parcel post is adding to the burdens of the railroad and at the same time depriving them of a source of revenue which they previously enjoyed, and in return for which they rendered a valuable service. The parcel post is all right and the people should have it, but any reasonable man will agree that the Government should pay a fair price for the service, and I feel confident that eventually that fair price will be paid.

III.

The Present Position of the Railways.

We come very properly to inquire what has been the result of these and other forces which have focused themselves upon the railways. The situation cannot be presented any more succinctly than by stating a few of the facts which have been presented to the Interstate Commerce Commission in making the application for increased rates. The figures show that since 1910 the railroads in the territory affected have increased their investment in property and equipment by $660,000,000. During that same period their gross earnings have increased by $186,000,000, and at the same time their expenses have increased by $203,000,000. Thus these railroads found themselves worse off, after their last fiscal year, in net operating income by $17,000,000 than they were in 1910, before this additional investment of $660,000,000 had been made.

It was no wonder that Mr. Daniel Willard, president of the Baltimore and Ohio Railroad, in opening the case for the railroads before the Interstate Commerce Commission, made this remark:

"In view of all this, those responsible for the management of these properties would not be justified in continuing large expenditures of new capital for additional facilities and equipment, even if such capital were available at reasonable rates of interest."

The railroads in Central Freight Association territory for the past three years show in gross revenue, an increase of $78,000,000 a year, but a loss of $12,000,000 in operating income, after having added $123,000,000 to property investment. The return for these same companies for the months of July, August and September, 1913, show, as compared with the same months of 1912, a further shrinkage in net operating income of $7,000,000, or nearly 20 per cent.

The various lines of the railroad system with which I have the honor to be associated added $203,000,000 to their property investment between June 30th, 1910, and June 30th, 1913, and yet their net operating income for the year ending on the latter date was $11,000,000 less than for 1910, before this new money had been expended.

The Nation Threatened with Arterio Sclerosis.

Those of you who have in recent years been examined for life insurance have found that a special apparatus has been applied to ascertain the expansibility of your arteries, to find whether or not there was any tendency in your bodies toward hardening of the arteries, or as the doctors call it, arterio sclerosis. To apply the figure to our country: Are we not now receiving a blood pressure test indicating a very definite tendency toward national arterio sclerosis, or hardening of our great arteries of trade? Our country is growing, vast resources are being developed, immigration is increasing; yet our railroads are standing still.

It must be apparent that $203,000,000 one year cannot indefinitely be substracted from $186,000,000. And yet that is one of the problems which are pressing upon our country for solution, and it is pressing at a time when the world-wide demands for capital are increasing, and when the means for diverting the world's surplus capital into avenues which will yield the highest return, no matter where those avenues may be located, are being constantly simplified.

Can it not be that our country in its handling of the railroad problem has in recent years devoted so much energy to preventing discrimination between shippers and shipping communities that the necessity has been overlooked for conserving those delicate and sensitive factors which contribute so fundamentally to the perfecting and upbuilding of the transportation machine?

A few verses in Paul's first letter to the Corinthians, chapter XII, would seem to apply to the situation:

"For as the body is one and hath many members, and all the members of that body being many are one body;

"The eye cannot say unto the hand, I have no need of thee: nor again, the head to the feet, I have no need of you;

"And whether one member suffer all the members suffer with it, or one member be honored, all the members rejoice with it."

To be quite frank, gentlemen, the railroad manager wants to be honored, and he wants you to rejoice with him in the fact. He is earnestly trying to do his duty, and he begs your support and sympathy in accomplishing it.

We have pending to-day before the Interstate Commerce Commission an application for an increase of five per cent in freight rates. While the settlement of this particular proceeding must be made by the Commission itself, upon the basis of the facts presented to it, the railroad problem as a whole if it is to be solved properly it can only be so with the thoughtful and broad-minded support of the American people.

Let us not imagine that even if this increase is granted, all our troubles will immediately vanish. If you must have a tooth filled, you do not go to a dentist and merely ask him to prepare a crown with which to cap the tooth. You realize that the most perfectly designed crown ever made, if placed upon a cavity which had not been thoroughly excavated, would sooner or later find that the forces which had caused the original trouble would, not having been removed, again undermine this model superstructure. And so, dealing with the railroad problem we must not forget that there is a vast mass of error and unwisdom which has already found its way into public opinion and legislation which must be removed before a settlement will have been reached upon which sound progress can be based.

We come, therefore, seeking your support, and my feeling is that in seeking your support we shall realize completely in Pittsburgh the fulfillment of the prophecy so tersely expressed in Scriptural phrase: "Seek and ye shall find."

Government Regulation of Railways

An Address Delivered Before the Annual Meeting of the California Bar Association on November 20, 1913, at San Diego, California.

By William F. Herrin.

If, in railway regulation, our aim is to subserve and advance the public welfare, we are aided but little by a too exclusive reliance upon mere legal learning. Our true enlightenment must come from a study of the economic and financial conditions involved. We can thus more clearly discern the public interests affected and more readily understand that these interests are not really antagonistic to those of the railways. On the contrary, these interests are interdependent, and an injury to one works to the disadvantage of the other. In adopting this line of discussion, I assume that the public interest is of first importance and my purpose is to consider how that interest can best be promoted. I am not here to make a special plea for railway interests, but shall attempt, from an independent and impartial standpoint, to arrive at the principles which should govern the proper exercise of this regulative function. Naturally, with the lawyer's habit, I shall cite authorities to sustain my views—not by any means all the authorities which might be cited, for I shall ignore all who have been identified with railway management or service, however able or experienced they may be, and will content myself with citing only those whose study of the subject from an independent standpoint makes their conclusions worthy of our serious consideration, and whose record and position in public life lend no critic the opportunity of saying that they are biased in favor of railway interests.

One of the leading members of the Interstate Commerce Commission in point of ability and experience—Hon. Charles A. Prouty—recently said in his address before the National Association of Railway Commissioners that:

> **"The United States is trying an experiment which never has been successfully worked out yet in the history of the world. It is trying to build, develop and operate its railroads by private capital under rates and regulations fixed, not by the owners of the capital, but by the public."**

This authoritative statement challenges our attention. From it we apprehend that the scheme of public regulation of railways in this country is on trial, and we realize the novelty of this experiment and appreciate its tremendous importance not only to the owners of the billions of private capital involved, but to the public which is vitally interested in these modern highways of transportation. How to balance and harmonize these enormous interests might well perplex the ablest minds. The difficulties of the problem which must be solved no doubt question the wisdom of this experiment, but it would be idle to stop now to discuss whether or not the present scheme of regulation should have been adopted. It will not be abandoned because of difficulties which may arise—it must proceed to its conclusion of success or failure.

But it is profitable, for a moment, to recall the evils which arose in the administration of railways before their public regulation was attempted.

No principle is more vital in railway administration than that there shall be no unjust discrimination between shippers as to service rendered or the rates charged therefor. Unless all shippers pay the same rates for the same service, it would be possible for the favored shipper to cripple or destroy his business rival. There could be no more insidious or vicious practice than to favor one shipper or class of shippers at the expense of others. Such a disturbing force would prevent any sound business development and would be corruptive and destructive in its tendencies. Yet these vicious discriminations were frequent before they were abolished by the force of government regulation. Before such regulation, not only was the commercial business of the country prejudicially affected by the giving of rebates or secret rates, but such practice no doubt tended to impair the security of railway investments. At least we know that railroad bankruptcies and receiverships were more frequent in the days of rate-cutting than they are now, and while other causes may have contributed to such bankruptcies, yet it is certain that the cut-throat competition between railroads by means of rebates was in some measure responsible for the uncertain conditions of railroad finance. These conditions were intolerable to railroad management, and in justice to railroad managers it must be said that they were the victims of the business practices of the time. The traffic manager could not secure business for his road unless he met the rates given secretly by his competitor. However much he might desire to maintain his published rates and deal fairly with all his patrons, he was forced, in competition with other carriers, to the giving of secret rates. Such practices could not be stopped except by government regulation, for one carrier could set the pace which all its competitors must follow. Undoubtedly, the removal of this one evil of secret rates and rebates fully justified government regulation, and I think no railroad manager would agree to dispense with government regulation at the cost of returning to the old conditions. No one familiar with the history of this subject can doubt that the provisions of the interstate commerce law, enforcing strict compliance with the tariffs filed, have been of great benefit to the railroads, and I think we should not doubt the sincerity of the leading railroad officials when they state that they accept government regulation and are, in good faith, aiding in the enforcement of the law.

Not only in the enforcement of the tariff rates, but in other important particulars, is the law helpful to railroad interests. For example, in the making of tariffs, especially before government regulation, the carriers were often induced—I might say compelled—to publish rates which unjustly discriminated as between persons or places. Shippers offering large tonnage were frequently able, as the consideration for their patronage, to secure more favorable rates than were given to smaller shippers, and important and influential business centers often, for similar reasons, were able to secure advantages over smaller communities which should not have been given. The action of a commission in removing such discriminations would be accepted by the parties interested, whereas, should the railways alone attempt to do this, they would provoke hostility upon the part of those who might have the power of injuring them. In other words, there are many questions which must arise between the railways and their patrons which should be determined by some impartial arbiter, and in all such cases it is for the best interest of the railways that a tribunal should be provided to determine these questions. I have said this much to show that the railways have good reason to accept any rational and fair scheme of regulation administered with reason and impartiality.

How, then, arises the doubt in the mind of Interstate Commerce Commissioner Prouty that the scheme of railway regulation adopted in the United States may not be successful?

He says:

> **"The question is here, Can you obtain under this system (of regulation) the new money which is necessary to develop our old railroad systems and to build our new railroad systems? That is the crucial question."**

Upon this point he further says:

> **"When the Interstate Commerce Commission makes an order, which possibly means $1,000,000 a year to the carriers affected by it, $20,000,000 upon a five per cent basis, in one single bite, you cannot help feeling the load of responsibility which goes with the making of the order. . . . It is the duty of the railroad commissioner to most scrupulously protect the railroad, and to mete out to the railroad the most exact justice. It is coming to be apprehended that that is required, not merely as a measure of justice to the railway, but as a measure of right in the interest of the public.**
>
> **"The railroad is a public servant. That phrase comes to us from the Supreme Court, and has been for a quarter of a century in the mouth of everybody who has to do with this subject. It comes, as time goes on, to take on a different meaning. Originally, the people said, 'The railroad is our servant, therefore we can kick the railroad and cuff the railroad ad libitum.'**
>
> **"It is coming to be understood, gentlemen, that just as your servant can only properly discharge his duties, when he is suitably fed, suitably clothed, and suitably housed, so the railroad can only properly discharge its duties when it receives proper treatment from the public. It is coming to be apprehended that in the final analysis, the public pays the bill and that it pays for us, as railroad commissioners, to accord to the railroad just and fair treatment. That, I say, is not only demanded by justice—it is demanded by public interest."**

It certainly needs no argument to sustain the views thus clearly expressed by one so competent to speak upon this important subject. Mr. Prouty has no bias in favor of railroad interests. He speaks from the standpoint of public interest, and his long and notable record of public service requires us to give serious consideration to his views. He advances no doubtful premises or argument; on the contrary, his statements are obvious and self-evident truths which any fair-minded person must recognize.

No one will question the dependence of this country upon its railways. No other factor has been so important in our national development, and if our country is to advance it must have adequate transportation facilities. Interstate Commerce Commissioner Franklin K. Lane has well said that:

> "The railroad is our common highroad; it is not a luxury; it is not a concern in which the farmer and the manufacturer alone are interested; it is an essential to the commercial life of our people, almost as necessary as the land itself, for we have grown up as a people to be physically dependent upon our railroads. No other people are so bound up as we in economic inter-dependence. No one community in all this land lives to itself. We have grown as railroads were built. We have made a community of a continent."

To the same effect I quote from Theodore Roosevelt:

> "The great need of the hour, from the standpoint of the general public—of the producer, consumer and shipper alike—is the need for better transportation facilities, for additional tracks, additional terminals, and improvements in the actual handling of the railroads, and all this with the least possible delay. Ample, safe and rapid transportation facilities are even more necessary than cheap transportation. The prime need is for the investment of money which will provide better terminal facilities, additional tracks, and a greater number of cars and locomotives, while at the same time securing, if possible, better wages and shorter hours for the employees. There must be just and reasonable regulation of rates, but any arbitrary and unthinking movement to cut them down may be equivalent to putting a complete stop to the effort to provide better transportation."

In order to equip our railroads to meet the demands upon them, and to keep pace with the development of the country, large amounts of private capital must be provided. Many hundreds of millions of dollars annually are required for this purpose. During recent years the railroads, because of the difficulty of securing the necessary capital, have not been able to make the extensions and improvements requisite to meet extraordinary conditions which have occurred and may occur again at any time, such as a large agricultural crop throughout the country, or traffic movements required in case of war, etc. As a consequence the railways may be said to have fallen behind the country's progress and necessities.

How far new capital is required for the improvement of our railways has been given careful consideration by the Railroad Securities Commission appointed by the President under an Act of Congress, which made its report in November, 1911. President Hadley, of Yale, was chairman of this Commission and his associates were men of high character and ability. The report of this Commission says:

> "There is a widespread belief, based on imperfect examination of the evidence, that the amount of capital needed for the future development of our railroad system is small in proportion to that which has been required in the past; that the profits on such added investments of capital are reasonably well assured; and that we can therefore fix attention predominantly, if not exclusively, on the needs of the shipper without interfering with the necessary supply of new money from the investors.
>
> "It is quite possible that the building of additional railroad mileage will be far less rapid in the future than it has been in the past, but the capital needed for the development and the improvement of the mileage already existing is enormous, even if we built no new mileage at all. The outstanding stock and debt of the railways in the United States averages less than $60,000 a mile of line. This figure is bound to be greatly increased in the immediate future. As our population grows denser, we shall need more and more to approximate European standards of construction by the increased amount of double track, the abolition of grade crossings, the development of station facilities both for passengers and for freight, and many other improvements scarcely less fundamental. While our railroads are perhaps even better equipped than those of Europe for the economical handling of large masses of long distance freight, they are far from being adequately provided with appliances to secure the convenience of the public or the safety of passengers and employees. The cost of all these things is very great. The average capitalization per mile of railroads in Germany is $109,000, in France $137,000, in Belgium $177,000, in Great Britain $265,000; and, contrary to the commonly received opinion, much of this excess of cost as compared with American roads, is due to other causes than the price of real estate—an item in which our companies have had a great advantage. The cost of European roads has been largely due to improvements which we have not yet made and many of which we must make in the future as population grows denser. The thousands of millions of dollars needed for these purposes must be raised by the sale of securities."

Now, can the railroads, under present conditions, offer securities upon which the needed funds can be obtained?

Upon this point the Railroad Securities Commission say:

> "Neither the rate of return actually received on the par value of American railroad bonds and stocks to-day, nor the security which can be offered for additional railroad investments in the future, will make it easy to raise the needed amount of capital.
>
> "The ratio of interest and dividends to outstanding bonds and stocks of American railroads is not quite four and a half per cent in each case. The average ratio of dividends to the capital of national banks is between ten and eleven per cent. If it be objected that the value of the stocks of our railroads is in considerable measure due to the growth of the community rather than to the cash originally invested, and that the bonds and stocks of railroads should therefore be compared with the combined capital and surplus of the national banks, we find that these banks have for the last three years maintained an average ratio of dividends to capital and surplus combined of over six and a half per cent. If we look not at the sums divided, but at the sums earned, we find the same difference of profit in favor of the banks."

And further this report says:

> "We hear much about a reasonable return on capital. A reasonable return is one which under honest accounting and responsible management will attract the amount of investors' money needed for the development of our railroad facilities. More than this is an unnecessary public burden. Less than this means a check to railroad construction and to the development of traffic. Where the investment is secure, a reasonable return is a rate which approximates the rate of interest which prevails in other lines of industry. Where the future is uncertain the investor demands, and is justified in demanding, a chance of added profit to compensate for his risk. We cannot secure the immense amount of capital needed unless we make profits and risks commensurate. If rates are going to be reduced whenever dividends exceed current rates of interest, investors will seek other fields where the hazard is less or the opportunity greater. In no event can we expect railroads to be developed merely to pay their owners such a return as they could have obtained by the purchase if investment securities which do not involve the hazards of construction or the risks of operation."

So we have this problem in a nutshell. The railways cannot compete with other industries in obtaining money for their needs unless their earnings approximate the rate of return gained by such industries. If railway earnings are less than this, capital will seek investment in other securities, leaving the railways without funds needed. The securities offered by railroads must, at least, equal in attractiveness those offered by other industries, or capital will avoid railroad investments.

It is a matter of common knowledge that for the last three or four years it has been very difficult for the railroads to secure upon any reasonable terms the money actually needed by them. I do not ignore the fact that the stringency of the money market affects all other enterprises, including the efforts of states and municipalities to borrow money. But the railways are under special disadvantage in that they cannot raise their rates without the consent of governmental authority while other corporations and individuals free from such regulation may raise their prices and thus secure a return to meet new financial conditions—and state and municipal corporations may, of course, rely upon the practically unrestrained power of taxation to secure necessary funds.

Now, if the present tariff rates were certain to be continued, so long as the earnings were necessary to the finances of the railways, it would still be difficult under present conditions for them to secure the money urgently needed for improvements. But the railways cannot deal with this subject upon the assurance that present rates will be continued; on the contrary, rate reductions are being made from time to time by the Interstate Commerce Commission and by state railroad commissions, and applications for increase in rates have generally been unsuccessful, so that the governmental power to fix rates overshadows the situation as a menace which makes it practically impossible at the present time for the railways to secure any long-time loans, or any loans upon reasonable rates of interest.

I assume that present financial conditions are temporary, and that in the near future we may expect the return to normal conditions; it is in view of such normal conditions that we should consider these questions, and if we assume the most favorable financial conditions, the fact still remains that the Interstate Commerce Commission, and the state railroad commissions, with the power vested in them to fix rates, may make it difficult, if not impossible, for the railroads to obtain the money needed. That is to say, if the power of regulation is so exercised as to force reductions, which, if accepted, must result in bankruptcy, the relief which might be given by the courts after tedious and costly litigation would hardly invite the investment of private capital. Even though the capital already invested could be protected against arbitrary reductions, it could not be expected that new capital would be found to run the risk of further litigation, and, as President Roosevelt has said, an arbitrary rate reduction might put a complete stop to the effort to provide better transportation. So we are forced to the conclusion that it rests with the railroad commissions, state and national, to determine how far, if at all, the railroads of this country shall be extended and improved by means of private capital.

In his address, from which I have already quoted, Mr. Prouty, in referring to the fact that practically all railroad building in Canada was aided by government subsidies, said:

> "We may come to that same idea. We may conclude that railroads ought not to be allowed to charge rates which will induce the building of new railroads by private capital. Perhaps that ought to be the conclusion, but what I say now is that upon the manner in which you gentlemen (the Railroad Commissioners of the different States) deal with this subject of railroad regulation, very intimately depends the success with which this experiment is to be worked out, and the future of that question in this country of ours."

The *experiment* to which Mr. Prouty refers is, as stated in his own language, the building, development and operation of the railways of this country "by private capital, under rates and regulations fixed, not by the owners of that capital, but by the public."

Now, what are the difficulties, if any, which stand in the way of the success of this "experiment"? First, let us define this power of regulation, and mark its boundaries and limitations.

The Supreme Court of the United States has more than once said that this "power of regulation is not the power to destroy." There is nothing inherent in the power of regulation which should make it a destructive force. On the contrary, there is no good reason why it should not secure every public interest without impairing the investments which have produced the railways of the country.

Again, in speaking of this power of regulation, the Supreme Court of the United States recently said:

> "It must be remembered that railroads are the private property of their owners; that while from the public character of the work in which they are engaged, the public has the power to prescribe rules for securing faithful and efficient service and equality between shippers and communities, yet in no proper sense is the public a general manager."

And the court, in the opinion from which I quote, goes on to define the power or function of regulation to be the enforcement of two leading prohibitions against the railways, viz.: (1) "that their charges shall not be unjust or unreasonable," and (2) "that they shall not unjustly discriminate so as to give undue preference or disadvantage to persons or traffic similarly circumstanced."

Now, certainly, the removal or prevention of unjust or unreasonable rates, and of unjust discrimination, would strengthen rather than weaken the railways, and if the regulative power had been exercised strictly within the definitions of the United States Supreme Court there could be no serious question that the experiment of government regulation would prove successful—that is to say, the railways of this country could be extended, maintained and operated to their highest efficiency by means of private capital, and without financial aid from the government.

Since the era of railway bankruptcies and receivership in the early nineties, the commercial and business development of the country has largely increased. For example, comparing the years 1892 and 1912 we find that the freight tons carried one mile increased 202.9 per cent and the passengers carried one mile increased 150.8 per cent. Because of reductions in rates this increased volume of business in 1912 produced only 59.9 per cent more revenue than was earned in 1892.

While owing to the increasing volume of traffic many roads are able to show an increase in gross earnings, the increasing expenses of operation almost uniformly reduce the net earnings. For example, between the years 1907 and 1911, the railways of the United States put into their property over two billion dollars new capital, yet they received over eight million dollars less net earnings than were received by them in 1907 before this two billions of new capital was invested.

These striking facts explain the decline of railway credit, and the practical inability of the railways at the present time to secure the new capital needed by them. It is no exaggeration to say that railway financial conditions are critical. Yet, the broad fact remains that the sparsity of traffic which in 1892 contributed to railroad bankruptcies no longer exists. The main lines of road almost without exception now enjoy a volume of traffic sufficient, with reasonable rates, to ensure their successful operation, and this, notwithstanding the largely increased expenses of operation.

We may here naturally inquire how far the expenses of operation have been increased through governmental regulation. This includes legislation, state and national, which has contributed many conditions requiring increased expenses, such as laws regulating the hours of service, safety appliances, separation of grades, full crews, headlights, standards of construction, etc. Then the cost of complying with orders of commissions, state and national, as to keeping of records and statistics and furnishing copies of same is considerable. The increase in wages has added very greatly to the cost of operation. Congress, by the enactment of what is called the Newland's law, which is a development of the former Erdman act, has provided a method for the arbitration of labor disputes. In order to avoid strikes this law must be invoked and in so far as the officers of the government participate in the proceedings under this law they must share the responsibility for the resulting increase in wages, if any.

Then we have also the increase in taxation, which, comparing the years 1892 and 1912, is more than 250 per cent. Throughout the United States the railways pay in taxes 4.21 per cent of their gross earnings. In California we are required to pay 4¾ per cent.

All these items of expense should be regarded by the railway commissions, state and national, in their decisions as to the reasonableness of rates, and where, through no fault of the railway, expenses of operation have increased, it is difficult to understand why compensatory increases in rates should not be allowed. If such compensatory increases were permitted, no question would arise as to the adequacy of private capital to meet the problems of railroad operation, maintenance and extension.

By private capital I mean the funds obtained from private investors—which is the source from which all business of the country derives its support. Such funds will naturally seek the investment or security which promises the highest rate of interest without danger of losing the principal. It follows that the credit of the railways can only be maintained by earnings sufficient to make investments in their securities as attractive as those offered by other business investments.

The rationale of this situation is well stated by the Hon. Franklin K. Lane as follows:

> "If our commerce is to grow and trade is to be fluent, if we are to continue as a multitude of interdependent communities and individuals, if we are to give the world the benefit of the great resources of this country, and put to its highest use the genius for industrial development which our people manifest, our existing lines of railroad must be made profitable to their owners, and money must find that investment in railroads is both attractive and secure. A regulating body which is not fair to those who have invested their money in a public utility does infinite damage to the community that it is attempting to serve. To be just to the stockholders, however, does not mean that injustice must be done the public. The traffic manager may not ask all that the traffic will bear without doing his railroad in the end a great wrong, nor can the shipper hope to have lasting benefit from any injustice done to those who have put their money at the public service."

Obviously, the experiment of government regulation must prove a failure if it forces down the net income of the railways to such an extent thta new capital needed for extensions and improvements cannot be secured. This may be done not only by reducing rates but by imposing conditions which largely increase the expense of operation.

After all unjust discriminations are removed, and the rates are such as do not obstruct the movement of traffic, the first interest of the public is that railway earnings shall be sufficient to give the railways first-class credit in the money markets of the world, for it is only by such credit that adequate transportation facilities, by means of private capital, can be secured.

It is far better for the business of the country that railway earnings should be sufficient to maintain such credit than that any mere reductions in rates should be made which might impair that credit. Concretely stated, it is far more important to the public interest that the money necessary to furnish adequate transportation facilities should be expended by the railways for that purpose than that tariff reductions should be made to the extent of the interest rate upon that money.

The first consideration of the rate-regulating power should be to secure the most efficient transportation facilities for the public, and obviously it should avoid any policy or action tending to cripple the railways or lessen their ability to perform their public service.

When all unjust discriminations are abolished and resulting rates are such that all traffic freely moves between points of production and market destination, such rates are certainly not unreasonable to the public, even though they produce large railway earnings, and if such earnings are actually required as a basis for obtaining the new capital needed for extensions and betterments, why should they not be allowed? Why should there be an effort on the part of the governmental authorities to force these rates down to, or nearly to, the point where the courts would enjoin the reduction because confiscatory? The shipper has no real complaint if he is on an equality with all other shippers and his merchandise readily moves at the higher rate which insures him the most efficient transportation facilities. To bring the rate down nearly to the point of confiscation, and thus prevent the needed extensions and improvements in transportation service required by the shipper, is an actual detriment to the shipper and therefore to the public.

What I have said may not be dismissed as a partisan argument advanced by a railroad official for I am fully sustained by what was said by Judge Prouty in a recent public address and I take the liberty of further quoting from him as follows:

> "The two original purposes . . . . of this (Interstate Commerce) act were, first, to prevent discrimination; second, to make rates reasonable. . . .
>
> "I think those two purposes of the act to regulate commerce have been in the main accomplished. . . .
>
> "What I may term the danger point in the railroad situation has very radically changed in the last 25 years. Twenty-five years ago the danger point was the discrimination. Twenty-five years ago the danger point was the unreasonable rate. To-day, in my opin-

> ion, neither of those are danger points. The danger point to-day, I think, is the inadequate service, and the inadequate facility.
>
> "Now I am speaking to business men. I believe you will agree with me that the service and the facility are of more importance to you than any slight difference in rate. You want your cars. You want reasonable expedition. You want everything which goes with an efficient service, and that you must have. . . .
>
> "I think that to-day it is just as much the duty of the commission to see that the railroads are given reasonable rates which will yield to them a fair return, as it is to see that no unreasonable rate is charged to the shipper, and I believe this is in the highest interest of the shipper himself. . . .
>
> "When you reduce the rates of the railroads of the country to a point where they no longer yield a profit, you have destroyed the value of their property, you have annihilated their credit, and you have made it absolutely impossible for the railroads to provide the service which you must have.
>
> "I ought, as a member of the Interstate Commerce Commission, in passing upon the reasonableness of a rate, to bear in mind the fact that that property has been dedicated to the public use upon the theory that it is to enjoy a fair return. But if I were to lay out of view entirely the interest of the railroad, if I were to consider your interest, and your interest alone, it would be my duty, and my highest duty to you, to allow the railroad a sufficient rate so that it might from that rate obtain the needed revenue with which to develop, with which to maintain its credit, with which to give you the service which you must have, and which you cannot otherwise enjoy. . . .
>
> "In the past, as a rule, the orders of the Commission have been in reduction of rates rather than in permitting their advance. . . . But this is a time of change, and no man can forecast the future. The cost of living is advancing. The cost of almost everything which a railroad buys is increasing. Wages which they must pay are increasing. . . . So I say to you, gentlemen, that no man can foretell whether in the years to come it will be, or will not be, necessary to allow some increase in the transportation charges of our railroads. What I desire you to remember is this: That if that time comes, it will be the duty of the commission to permit that advance. That would not only be an act of justice, which you, as believers in the square deal would approve, but would also conserve in the highest degree your interest as shippers."

In what Judge Prouty has thus said I believe he represents the spirit and thought which actuates his colleagues as well as the railroad commissions of the different states in the discharge of their official duties, and from this I argue that the railroads need not fear injustice which at the same time would cause a greater injustice to the best interests of the whole country.

We cannot doubt that when these considerations are generally understood, as they are coming to be and will be, the public interest in these matters will receive protection at the hands of the railway commissions of the country. I do not think it possible that the railway commissions will deliberately or purposely embarrass the railways to prevent them from obtaining the private capital required for their needs; in other words, to make the experiment of government regulation a failure in order to bring about government ownership of the railways. I do not believe that government regulation will be made a failure because of the deliberate purpose of railway commissions to make it so. All that is needed is a thorough understanding of the situation, not only by the railway commissions but by the railway officials themselves, and it is the clear duty of the latter to aid in every reasonable way the railway commissions in their work. As I have said, the railway officials have good reason to accept this regulative function on the part of the government, but this function involves many difficult and complex questions which can only be solved rightly and for the best interests of all by the thorough co-operation of railway officials with the railway commissions.

The office of a railroad commissioner is one of high responsibility. I believe no other office in our government is more important. It requires great ability and no one can be well qualified for this position without training and experience and such independence of character as makes the official indifferent to mere political preferment. The tenure of office and salary paid should be such that there would be no difficulty in obtaining for these places the best qualified men in the country. The work thus far done by the railway commissions, state and federal, while largely preliminary or formative, gives earnest of the permanent value of this governmental function. The public is coming to recognize its importance and no doubt will insist upon any changes either in the law or in its administration which are necessary to make the experiment of public regulation a success rather than a failure.

I have aimed briefly to point out the importance, not only to the railways but to the public, of government regulation of railways. I have shown, I think, that without such regulation neither the public interest nor that of the railways was fully protected. Some measure of regulation was therefore necessary. It may be that the regulation which has ensued has gone beyond the best and wisest limits; but I do not think it material to raise that question, for, after all, a wise and enlightened administration of the present laws upon this subject will, I am satisfied, be successful, whereas, the best laws possible would result in failure if unwisely, ignorantly or viciously administered. So the administration of our present laws is the all important thing, and that of course, largely depends upon the men who constitute the Interstate Commerce Commission and the railroad commissions of the different states. There are possible conflicts between the national and state authorities which may only be solved by additional legislation but in good time that will be provided, if necessary. And while the leading responsibility for success or failure of government regulation must rest upon the railway commissions, I have frankly stated that the railway officials cannot escape a large responsibility, and their duty is plain to co-operate with and aid the government officials in every reasonable way. Where the officers of the government go beyond the limits of constitutional power, and such acts affect the vital interests of the railways, there is no recourse other than an appeal to the courts of the country. But I hope the period of litigating questions of constitutional law upon this subject has largely passed and that the effort of all officials and parties interested will henceforth be loyally devoted to solving the question at hand in the best interest of the public, for, if that is done, I am certain that the railway interests will be fully protected.

The Year's Anthracite Shipments.

FINAL figures for 1913 show that the total shipments of anthracite coal from Pennsylvania last year were 69,069,628 tons. This is 5,459,050 tons more than in 1912 when the output was curtailed by a suspension in the spring while a new agreement was being negotiated with the mine workers; but 884,669 tons less than in 1911 which was the record year for high production.

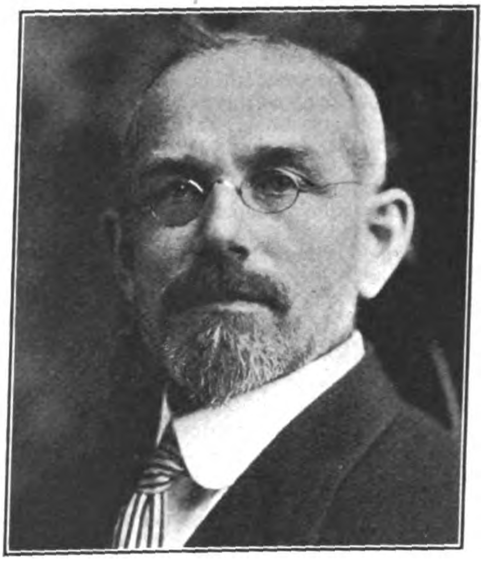
Total shipments of anthracite last month were 5,662,618 tons as against 5,944,502 tons in December, 1912, a decrease of 281,884 tons.

Certain Considerations in Railway Rate-Making

FROM A PAPER BEFORE THE AMERICAN ECONOMIC ASSOCIATION, MINNEAPOLIS, MINN., DECEMBER 29, 1913.

By BALTHASAR H. MEYER,

MEMBER OF THE INTERSTATE COMMERCE COMMISSION.



I BELIEVE it is possible to approximate a standard in rate-making much more than has been done in this country in the past, but the kaleidoscopic nature of the facts which enter into a particular rate problem will probably always defeat every attempt to impose a uniform rate rule upon the traffic of to-day throughout the United States. Were we standing at the threshold of the industrial epoch which brought the railway and modern manufactures with none of the industrial relations of the contemporary structure of society established, a very different problem, and, consequently, also a very different solution, would be presented. The standard which I expect to see develop more rapidly in the future than in the past is a certain approximate standard applicable to normal or typical conditions from which variations will be made in the light of the concrete facts in each particular case.

THE RATE PROBLEM PERPETUAL.

This is not the first time that the economic association has devoted a part of its meeting to a discussion of railway questions, as an examination of past programs will attest. In all probability, it will not be the last, for the question of railway rates embraces elements which are perpetual and which doubtless inhere in every industrial society which employs the railway as one of its instrumentalities. As long as rival individuals engage in trade, offering the same or competing commodities, placed upon the market by competing producers and sought by rival consumers, and any or all of these believe transportation charges to be excessive or discriminatory, the railway rate problem will continue to exist. The present system of private ownership and systems of regulation may give way to different systems of regulation, and these in turn may be superseded by a system of public ownership; but none of these will terminate rate controversies. Changes in ownership and systems of regulation and administration may eliminate some rate questions; they will with certainty originate others, and the rule or rules which suggest settlements to-day may have to give way to other rules which the conditions of the future may require. The doctrine of relativity applies also to transportation.

RAILWAY RATES AND IMPORT DUTIES.

In dealing with railway rates we come in contact with nation-wide interests and forces, and, indirectly, and perhaps involuntarily, also with international forces. Under the law our appointed jurisdiction in the United States may stop with ocean, gulf and the 49th parallel; the economic effect of our action often goes far beyond. Considerations of this kind have led those foreign countries in which the railways are publicly owned to view their respective industrial policies as a united whole, of which the railway is a part. The administration of the railway is there made an instrument in shaping commercial policy. Railway rates and customs duties are frequently treated together, and rate-making is conducted in harmony with the customs policy of the country. In the United States, customs duties and railway rates have as a matter of law always been strictly divorced. Whether railways will be permitted in the future through the rates of transportation which they prescribe to augment or diminish the rate of import duty imposed by the Federal Government, only the future can reveal. It will probably depend upon the wisdom and discretion with which the power of making railway rates will be exercised in this respect.

COMPARATIVE RATES.

It has long been customary to establish rates in the light of certain checks and comparisons. This has apparently been done on the theory that if numerous other rates can be cited which are applicable on the same or similar traffic, under substantially similar circumstances and conditions, a rate in harmony with such illustrations is likely to be just and reasonable. Comparisons of this kind when restricted to small areas, such as a single state, are rarely satisfactory, but when they extend over a number of states, or embrace the entire United States, including numerous rates which are the result of competition between carriers, water and rail, while not necessarily determinative are, nevertheless of sufficient interest and value to command respectful consideration if not confidence. In the absence of better measures and checks this is one of the most useful expedients. Its intrinsic value depends, of course, upon the manner in which the rates drawn into the comparison have been selected, and the influences and forces which united in originally establishing them.

COMPETITION IN RATE MAKING.

This suggests the element of competition as one of the considerations in the making of railway rates. The members of the economic association are so thoroughly familiar with the general aspects of this feature of our problem that I shall not devote any time to it. There are survivals of the competitive rate, but the merest novice in the railway history of the leading countries of the world knows that competition alone has nowhere permanently secured to the public reasonably adequate service at reasonable rates, and that in consequence practically the world over the competitive theory of railway rate-making has been abandoned. Where it does bring benefits to the public, competition is capable of producing better results than the best regulation. To what extent competition survives in railway rates or service to-day and what benefit the public may derive from it, lies outside of the scope of this paper.

VALUATION AND SECURITIES.

Perhaps the most important single factor, now unknown, which will enter into the consideration of railway rates in the future is that of the value of the property. Theoretically, it has long been considered by commissions and courts, but in practice its application has been limited to isolated valuations or partial valuations made under different, if not mutually exclusive methods, varying in degree of thoroughness and applied almost exclusively to meet allegations of confiscation of property. In the not distant future we may hope to know what the fair value or final value of our railway properties is, whatever these terms may be made to include. In the past attempt has been made to appeal to the volume and market value of outstanding securities with the view of having them considered as evidence of value to support a rate or rate structure under attack. In the future, after the valuations have been made, similar appeals can have little weight. Once the value of railway property has been officially established, and power to regulate service and rates co-extensive with the railway business lodged with competent administrative authority, the issuance of securities by railway corporations becomes a question of public morals. The public eye should be directed toward the value of railway property as determined under the valuation statute rather than to the market value, face value and number of pieces of paper which may have been circulated to represent the property. If there are people who prefer many pieces of paper, each with a smaller value, to fewer pieces of paper, each with a larger value, we may well permit them to gratify their whim, provided no burden is thereby imposed upon the rate paying public. As a matter of good morals we should prohibit as far as possible and make difficult the circulation of bad securities. We should legislate against the exploitation of the undiscriminating public when its speculative traits are appealed to, but under no circumstances should we recognize these engraved pieces of paper as the equivalent of property in the making of railway rates, or perchance, validate them through ill advised stock and bond legislation. The country urgently needs stock and bond legislation; but it will be better to have none than accept much of what is being proposed. What consideration, if any, should be given to securities issued in the past by railway companies in the valuation required to be made under the valuation act, is a matter which I cannot discuss with propriety at this time, and regarding which I shall express no opinion; nor should anything which I have said herein be construed as an intimation of what I believe the final conclusion upon this question ought to be. But what I am free to say is, that the task of valuation having been accomplished, outstanding securities against the valued property should not receive the least consideration in the establishment of rates to be collected for the public use of that property. As suggested before, with adequate legal provisions and effective administration covering value of the property, service, and rates, the public has no interest in railway securities except as a matter of morals. These moral purposes should be promoted and achieved to the fullest extent possible through legislation but great care must be exercised lest this legislation may by inadvertence or design make the value of securities a basis for rates with the possible consequence of imposing untold and utterly needless financial burdens upon the present and future generations of rate payers.

COST OF THE SERVICE.

A second factor equally fundamental with the value-of-the-property factor, which I believe will be employed very much more in the future, is that of the cost of service. A great variety of statistical analyses have heretofore been made, but systematic efforts directed toward the ascertainment of the approximate cost of the service have, generally speaking, been strangely neglected. A small minority among those dealing with rate problems have long advocated it, but their plans have been thwarted by the skepticism and unwillingness of a persistent majority. There are those who have opposed the development of statistical investigations along the lines of cost because they assert the results are bound to be misleading and unreliable. Others confess a fear that information of that kind will be misused. Others declare that it will result in the establishment of rigid distance tariffs, with attendant chaos in the industrial world. Still others maintain the view that the cost of the service has nothing to do with the rate either in general or in particular. The combined weight and influence of all these objectors has thus far been sufficient to obstruct substantial progress.

GROWTH OF COST ACCOUNTING.

It is a fact of common knowledge that so-called cost accounting has been applied to every important branch of industry except steam railway transportation. A prolific literature upon the subject has been produced within the last decade, and competent specialists in all branches of business are prepared to give these principles practical application. The railways themselves have made limited application of the principles of cost accounting to more than one half of the railway mileage in the United States. They declare, however, that this has been done for internal corporate administrative purposes rather than with a view of assisting in the establishment of just and reasonable rates. The difficulties of separating operating expenses among the various branches of the railway business are as apparent as the benefits of the final results are clear to those who are willing to undertake the task. It is perfectly obvious that controversy respecting the apportionment of maintenance of way items, for instance, can never end. Is this, however, sufficient reason for refraining from undertaking a work which is so promising in beneficial results? There exists surprising similarity in the methods employed by different railway companies in apportioning certain common or over-head expenses. This similarity appears to have been brought about without previous conference and agreement and is apparently the result of similar conclusions arrived at by men working at the same problem independently of one another. However, I am not suggesting that methods and rules which are now found to be common to several railway accounting departments are necessarily those which commissions should accept or prescribe. If cost accounting is not to be applied to railway transportation until every refinement has been settled by unanimous consent of the accountants, we shall never get anywhere. Institutional reforms are rarely effected from within and the railway is no exception. If such a rule were to be applied to the assessment and collection of taxes the government of every civilized country in the world would be obliged to cease its activities for want of revenue.

PRACTICAL APPLICATION.

A new system of express rates is about to be put into effect throughout the United States. It inaugurates a revolution in the conduct of the express business. It is a carefully considered experiment, the exact outcome of which no one can predict with full confidence. How will anyone be able to draw a conclusion at the expiration of a definite period of time regarding the financial results of the operation of the express companies without approximating a segregation of the expenses incurred by the railroads on account of the express business? Railway mail pay is the object of periodical controversy. Does not that involve essentially the same fundamental accounting questions? Passenger rates are an issue in different states in various parts of the country. How can these controversies be properly and justly settled without some reference to the cost of conducting the passenger business? One might suppose that the railways in this country would fairly vie with one another in producing the most scientific cost data in regard to their respective operations which the best talent can compile. With a few conspicuous exceptions, the exact contrary is the fact.

JOINT COSTS, ECONOMY AND EFFICIENCY.

Before I leave the subject of cost of service, kindly permit me to remind you of the impossibility of commenting upon such extremely important phases of the issues as are suggested by the words by-products and joint costs, which have been so ably treated by distinguished members of this association. I must deny myself the pleasure of reviewing their work.

Furthermore, I have commented upon the cost of service as a consideration in rate-making only. This entire paper might advantageously have been devoted to railway cost accounting as a test of efficiency and economy in operation; and after it has been ascertained what it actually costs to operate a railroad, a further inquiry into what it should cost to operate may profitably be instituted.

CONTROVERSY AN OLD ONE.

This whole controversy regarding the cost of the service is as old as the railway itself. Any method of separating expenses which may be adopted will at best have much room for honest differences of opinion and the employment of varying, arbitrary factors. To my mind this situation resolves itself ultimately into the fundamental proposition that cost, being one of the elements to be considered in testing the reasonableness of a rate, must be ascertained as accurately as the nature of the problem will permit, otherwise it can not be considered. How can anyone give consideration to costs unless he knows what they are? Concluding that we must arrive at costs, it devolves upon reasonable men to elaborate workable rules and methods and employ the results with a full consciousness of the limitations. After the value of the property has been established, the cost of conducting the business approximated, and the value of the service considered, there will still remain a wide zone within which to exercise "the flexible limits of judgment.

PUBLIC POLICY.

This leads me to remark briefly regarding a third fundamental factor which is influential in locating the point representing the rate within the zone of reasonableness, namely, that of public policy. The only public policy which the administrative branch of the government can officially know is the policy declared by the legislative branch through its statutory enactments. Legislatures set up the standards in accordance with which administrative bodies must measure rates; and regulative statutes generally leave ample room for the exercise of wise discretion. The public policy thus prescribed is expressed in most general terms, leaving the detailed applications to administrative action and judgment. It is not this kind of public policy which, if my impressions are correct, people have in mind when they assert that the making of railway rates has nothing to do with the cost of the service, but that it is entirely a matter of public policy. I think that generally this statement emanates from the idea that rates are to be established at any particular time solely in the light of the available surplus of the railway corporation upon which the rate is to be imposed and the judgment or feeling of the rate maker regarding the real or supposed needs of different patrons or classes of patrons. If this is the proper basis for the making of rates the statistical analyses to which I have referred above are superfluous and should not be undertaken. All that is necessary under the operations of that kind of a public-policy-system of rate-making is a balance sheet and an eye on the next election. It is ascertained how much money the railway company can spare according to its balance sheet, and then it is a matter of "policy" who shall get the benefit of the reduction or bear the burden of an advance.

RATES IN POLITICS.

Nor is such a theory and practice of rate making without merit. An organization of society is conceivable in which it would be the very best system. It would be a perfect fit in an ideal society constructed upon this theory. In a patriarchal organization of society it might be the only proper system, for the patriarch would be presumed to know from whom to take and to whom to give. Our present organization does not represent this type of society. An attempt to impose such a theory upon a democratic organization of society must inevitably result in throwing the entire question of railway rates into politics. It will then be largely, if not entirely, a question of clamor as to whether passengers shall ride at the expense of freight, whether wheat shall have the preference over cotton, live stock over lumber, coal over ore, vegetables over fruit, sugar over potatoes, rice over corn, etc. Obviously under such a system the available surplus will be dispersed—perhaps I should say, disbursed—in the direction of the loudest clamor and the largest vote. In a country like Prussia with its magnificent administrative traditions and machinery and far-sighted commercial and traffic statesmanship, an application of the patriarchal principle seems more readily conceivable, but even there rates are not made in just that way. While under a system of state ownership like the Prussian public policy in any proper sense of the term may exert itself more directly and more liberally, this policy is certain to meet shipwreck anywhere if it does not embrace approximations of standards with which to test that policy from the point of view of railway operation. In other words, public policy is a framework, a background, interpretive in character, which should act as a guide in the application of more definite working rules in rate making.

Directing Rate Development.

There have been developed in the United States systems of rates with blankets covering two thirds of the entire continent. Attempts have been made to break up these vast blankets, against which both common sense and reason instinctively rebel. But what is the standard toward which this breaking-up process is to be directed? Inordinately large groups have come into existence. If these are to be modified, by what measure is it to be done? The equalization theory of establishing rates for basal industries has been condemned. Along what lines are the new rates to be developed? The work of transforming these and other similarly indefensible features of rate-making of the past to which reference has just been made all point in the direction of greater consideration for distance in future rate-making. Transportation overcomes distance. Distance means expense. Shall distance have no weight in the establishment of the charge for that transportation? While no one who is at all familiar with the rates now in effect thoughout the United States could for a moment reasonably consider the rigid application of a distance tariff to all traffic, it is equally apparent that many peculiarly knotty complications and controversies have already been settled through the application of a distance tariff, and that many more await a similar treatment in the future. This being so, we find herein still another urgent reason for aggressively pushing investigations into the cost of the service.

Other Considerations.

The time limits wisely imposed by the economic association upon papers of this kind permit of reference only, without discussion, to the relation of freight rates to the classification of freight. The so-called elements of classification have been enumerated and discussed in numerous decisions readily available to all. From the standpoint of cost of service, classification resolves itself largely into ascertaining transportation costs and insurance risks. Instead of emphasizing volume of the traffic, it lays stress upon the balance of the volume of traffic in opposite directions. It inquires persistently into the utilization of car space and demands upon terminal facilities and generally acts as a unifying agent along defensible lines in the slow movement towards a uniform classification.

Value of the Service.

That indefinite term "value of the service" must also be separately named. "Classification" and "public policy" absorb the most of its content and "what the traffic will bear" may act as residual claimant. Those who are to follow me may attempt answers to questions relating to the value of service, to whom? for whom? for what?

Why a Rate Yard Stick Can Not Be Delivered.

If I have succeeded in pointing out "certain considerations in railway rate-making" they are the value of the property implying a fair return thereon, the cost of the service and a sound public policy, each to be applied and interpreted in the light of the others and of all other considerations whatsoever, through the exercise of a wise discretion in arriving at a judgment with respect to a particular statement of fact. The value of the property may be expressed in dollars in advance of any rate controversy. The rate of return may conceivably be established by fixed rules. The cost of the service may be approximated for any period of time and as of any date. Public policy may be outlined in general and specific language in legislative acts without reference to particular disputes All the other considerations in rate-making may be indexed and catalogued for handy reference. But no one can state in advance the specific facts in a rate problem or controversy and the attendant circumstances and conditions. A certain combination of facts may require the application of a certain standard. A combination of facts similar to these but in different proportions may require a somewhat different standard. Instead of searching for one standard a set of standards may be sought; and that standard or combination of standards employed in each particular case which is best adapted to promote justice to all parties in interest. It is more important that justice shall be achieved in a large way than that some specific standard shall be promulgated and adhered to under all circumstances. That is why I cannot give you a universal rate yard stick, but must content myself with directing attenion to a tew ot its fundamental components.

Annual Dinner of Newark Traffic Club.

THE Newark Traffic Club holds its annual dinner on the evening of January 24th. Addresses will be delivered by Mr. A. V. Hamburg, president of the Board of Trade and Mr. Jackson E. Reynolds, general attorney in the Central Railroad of New Jersey. Other speakers are also to be announced later. The dinner is to surpass all previous occasions, and surprises are in store for each guest.

Compensation of Labor on British and American Railways

By SLASON THOMPSON,

DIRECTOR OF THE BUREAU OF RAILWAY NEWS AND STATISTICS.

WITH wages one sixth to one half the scale forced on American railways by successive arbitrations at the point of the strike bayonet, British railways, with the approval of Parliament, have been permitted to meet small advances in the pay of employes with increased passenger fares and freight rates.

Hitherto it has been difficult to present in convincing form the disparity between British and American railway wages so as to show in their true contrast the fundamental differences existing in economies of construction and operation. This difficulty has been removed by the report just made by the British Board of Trade presenting terms of settlements in railway wage disputes during two years' operation of the amended Railway Conciliation Scheme. At a time when the relation of railway wages to railway rates has become of such engrossing interest in this country, it renders possible the measurement of American railway pay by British standards presented in the following statement:

DAILY RATE AWARDED BRITISH EMPLOYES COMPARED WITH 1912 AVERAGE EARNINGS PER MAN IN THE UNITED STATES.

	Great Britain Minimum	Great Britain Maximum	United States Average
Enginemen	$1.15	$2.18	$5.02
Firemen	.73	1.46	3.03
Conductors	.77	1.42	4.29
Trainmen	.63	1.42	3.02

Herein are set forth the actual earnings of four great classes of American railway labor in 1912, to which further additions have already been granted, compared with the new-won scale of British employes. For enginemen and firemen the services are almost identical, but conductors and trainmen here differ somewhat from the nearest British counterpart. American earnings, including overtime and extras, are used, it is true; yet their use against the British maximum is more than fair, for this is far above the average. Actual earnings, computed as the American's, would be roughly a mean between minimum and maximum. According to latest determinations, in fact, $1.86 daily was the average earnings for engineers, $1.11 for firemen and $1.26 for passenger guards.

VALUABLE NEW DATA AFFORDED.

As British railway wage rates, devoid of all extras, have been impossible of ascertainment through lack of published figures, the chief value of the present report to the student of foreign railways lies in its exact data on actual scales of pay. Yearly English compilations, presenting only for a selected week the actual compensation paid by 27 companies in the United Kingdom, show only the average earned per man; there are available now, however, specific rates awarded the individual classes of employes in 219 wage disputes with additional information as to present conditions of service on British railroads.

Of the 219 settlements 107 were arrived at by agreement between deputations of the men and the companies alone; 93 by agreement between the two sides of conciliation boards without assistance of a chairman and 4 by such agreement with mediation of a chairman. Only in 15 cases was a chairman's decision required after efforts at agreement had failed.

Tracing the highest and lowest wage per week awarded the several classes of railway labor in England, Ireland and Scotland, the minima and maxima set in any dispute during the two years follow. In each award the scale is to stand as a rule from 2½ to 3 years:

HIGHEST AND LOWEST WAGE AWARDED BRITISH RAILWAY SERVANTS UNDER REVISED CONCILIATION SCHEME.

	Min.	Max.
	Per Week.	
1. Brakesmen	$3.76	$8.50
2. Capstan men	4.61	7.53*
3. Capstan lads	2.18	5.10
4. Carmen & vanguards	3.89	8.02*
5. Carmen, lads	1.70	4.87
6. Carriage cleaners ..	4.13	6.31
7. Carriage cl'ners, lads	1.70	4.25
8. Carriage and wagon examiners	3.64	8.26*
9. Checkers	3.89	7.78
10. Checkers, lads	1.70	4.87
11. Couplers, chockers, chain boys & slippers	5.10	5.46
12. Couplers, etc., lads.	1.94	4.37
13. Clerks, men	4.13	....
14. Clerks, lads	1.70	3.89
15. Engine cleaners	2.91	5.83
16. Engine cleaners, lads	1.70	4.87
17. Engine drivers and motormen	1.15 day	2.18 day†
	6.90 week	13.08 week†
18. Firemen	.73 day	1.46 day†
	4.38 week	8.76 week†
19. Gate keepers	3.64	5.83
20. Greasers	2.43	7.29†
21. Greaser lads	1.94	3.89

45. Ticket collectors and examiners	4.13	8.50*
46. Ticket collectors and examiners, lads	3.40	4.37
47. Watchmen	5.10	7.29
48. Yardsmen	4.13	9.23*

---

* Maximum applies to foremen or specials.

† Exceptional rate for London district.

The highest wage rate awarded to any class of railway servants thus was the $2.18 daily or $13.08 weekly granted to engine drivers. This is to be compared with an average actual earning record in 1912 of $5.02 daily for enginemen of the United States; yet this British maximum wage not only is far beyond the generality of railway wages in the United Kingdom, but, as will be seen, is in itself exceptional for even railway engineers. There are American roads where the daily compensation of enginemen averages $5.50.

HIGHEST RATES RARE EXCEPTIONS.

Next highest in the wage scales set, it will be noted, are signal fitters and telegraph wiremen, but the rate, as indicated, is that set for foremen of the class in London. So also, with few exceptions, other wage awards which attain to the region of $8.00 per week apply to foremen, the leading member of a gang, to some special member or apply only in the London district. From an average maximum far below that figure rates of payment drop to the $2.18 per week which in one case was awarded to a porter in southwestern Scotland. This, too, is an exception. Conciliation Boards seem to have set 17 shillings per week ($4.13) as the general minimum for adult employes (although the minimum is broken also in certain cases of brakemen, carmen and vanguards, carriage and wagon examiners, checkers, engine cleaners, gatekeepers, greasers, number takers, permanent way men and shunters) and for "lads," as junior employes are termed, considered as apprentices, a minimum wage of 7 shillings ($1.70). For "lads" the maximum seldom is over £1 ($4.87) weekly.

As may be judged by the wide divergence between minima and maxima, unlike the practice in the United States no general wage rate applies to the same grade of railway labor. Two reasons explain the diversity: first, employes performing the same class of work with similar records of service vary widely in rate of pay because of difference in living conditions; secondly, employes performing the same class of work under similar living conditions vary widely because of difference in records of service. A graduated scale applies universally, in other words, itself adjusted to special conditions of special territories.

Lowest wage scales apply as a rule to Ireland, Scotland and the rural parts of England. Highest scales, on the other extreme, arise in the large cities where living costs are greater. So, in 1912, average weekly earnings of railway servants in Ireland were $5.04, in Scotland $5.91, and in England and Wales $6.80, the average for the United Kingdom being $6.65. The high record, $13.08, already mentioned in the case of engine drivers, applies to drivers of only a few long-distance trains on the Great Central Railway who reside permanently in London. Such men, receiving 3 shillings ($0.73) per week extra in consideration of their metropolitan living expenses, so attain their exceptional rate.

LABORIOUS ASCENT OF WAGE LADDER.

It is from the graduated scale, however, that one best appreciates the slow, laborious ascent which marks the British railway servant's rise in the wage scale. Beginning at the set minimum, his advance almost universally is at the rate of 1 shilling (24 cents) per week annually toward the maximum of the grade, reached not unusually after from 15 to 20 years. The maximum of $8.50 for brakemen is attained on the North Staffordshire Railway after 18 years of service, which began at $4.61. The similar maximum for passenger guards is reached on the same road in the "twenty-second year in charge of trains." In that period the guard has risen from 24 shillings to 35 shillings per week, that is, from $5.83 to $8.50, a weekly addition in 22 years of $2.67!

Money wages, it is true, constitute not the whole of the British railroad man's compensation, yet other allowances total almost nothing. A special investigation of 1907, results of which were published recently (See Railway Library for 1912, page 295), showed 204,237 adults and 15,915 lads receiving free uniform and other clothing; applied to all employes this was worth 8 cents per week for adults and 6 cents per week for lads. Free or reduced rent to 14,337 adults averaged for all employes 2 cents per week. Other allowances were of even smaller consequence. The British railway man is, moreover, allowed an annual holiday with pay varying with class of work and length of service from 3 to 6 days per year. Ordinarily, also, when required by work to lodge away from home temporarily, employes have been awarded "lodging allowances," which vary from 12 cents to 85 cents nightly.

It is significant, however, that in most cases where the bonus question has come up such extras in reward for added effort or efficiency are abolished at the request of the men in favor of the fixed advances demanded.

HOURS OF BRITISH RAILWAY LABOR.

Though hours of labor differ among the many classes almost as widely as do wages, ranging from 47 to 72 hours per week, the ten-hour day seems to be regarded as standard. Brakesmen work ten hours a day; engine drivers and firemen, 10 to 12; gatekeepers, 9 to 11; goods guards, 10 to 12; and passenger guards, 10 to 11. Permanent way men work from 55½ in summer to 47 in winter, with Saturday half-holiday. Overtime, as a rule, is paid as time and one quarter and Sunday, Good Friday or Christmas as time and one quarter to time and one half. Rare cases of double Sunday time occur.

What has been the total effect of these wage increases, already the cause for a rise in rates which has left few British railway charges untouched? Twenty-seven companies, employing more than 90 per cent of the railway servants of the United Kingdom, show these results.

AVERAGE WEEKLY EARNINGS OF BRITISH RAILWAY SERVANTS 1903 TO 1912.

First week in December.	Number employed in selected week.	Average weekly. earnings per head.
1903	448,944	$6.04
1904	446,197	6.08
1905	449,923	6.14
1906	458,579	6.17
1907	479,314	6.27
1908	459,753	6.07
1909	459,968	6.16
1910	463,520	6.25
1911	473,168	6.48
1912	482,905	6.65

Advanced wages granted toward the close of 1911 by many of the important companies, followed by additional increases on other railways in 1912, brought a rise of 23 cents in the average weekly earnings per man for 1911 and a further rise in 1912 of 17 cents per week! The 1912 average is 38 cents higher than that for 1907, another year of good trade.

American railways, paying an average wage of $733 per year, confronted by demands for 20 per cent advances and awards of 7 per cent, would seem to bear at least as heavy a burden as did their British counterparts, since compensated with public approval for their 2.6 per cent increase to a yearly wage of $346.

The Panama Canal and Transcontinental Railroads

EDITOR'S NOTE:—In view of the present agitation over freight rates and the nearness of the opening of the Panama Canal, the following abstract from "The Nation's Business" of conclusions reached by Professor Emory R. Johnson, now a member of the Pennsylvania Railroad Commission, in his study made in 1912 relative to the probable effect of this new waterway upon the currents of domestic commerce, are of peculiar interest to railroad officials. From a railway point of view perhaps the most interesting conclusion reached by Professor Johnson is that the general and immediate effect upon railroads of the opening of the Canal will be to lessen their profits, although he is hopeful that the ultimate effect will prove beneficial. This conclusion presents another argument, and a very forcible one, in favor of the rate increases which the railways in Eastern territory are now making an effort to have put in effect.

THE approaching completion of the Panama Canal lifts the question of its influence on transcontinental railroads from the realm of surmise into the realm of practical application and decision. It also becomes apparent that whether transcontinental railroads are affected either favorably or unfavorably there is a possibility of unfavorable influence upon business in the territory in the Middle West which they serve.

Early in 1912, Professor Emory R. Johnson prepared an elaborate discussion relative to "The Relation of the Panama Canal to the Traffic and Rates of American Railroads." This can be secured as Senate Docuemnt 875 of the Second Session of the Sixty-second Congress.

Professor Johnson brought together various groups of statistics that are essential to an understanding of his conclusions, but which cannot be printed in full within the limits of our space. Among other things, he showed the total intercoastal water traffic between 1906 and 1911. This is of particular moment to the whole subject. He shows that in the six years 1906-1911 the coastwise traffic of the Panama Railroad jumped from 50,851 to 211,028 tons. The coastwise traffic of the Pacific Mail increased from 50,803 to 76,972, though there were periods of sharp depressions in the meantime. In the year 1911, the California-Atlantic Steamship line carried 134,545 tons. In the six years the American Hawaiian Steamship line, omitting Hawaiian sugar, increased its tonnage from 146,900 to 458,300 tons.

All of the above mentioned lines used either the Panama Canal or the Tehuantepec Railroads. The approximate freight carried by way of Cape Horn and the Straits of Magellan declined from 271,276 to 137,907 tons.

Summing up all the traffic to come from the Isthmus, Professor Johnson shows that in 1906 the total, including Hawaiian sugar, was 560,727 tons, and that in 1911 it was 1,104,735.

These figures are included here to indicate that under normal conditions, with the exception of supplies for the Panama Canal, there has been a marked increase of intercoastal freight carried by water. The influence of the Tehuantepec Railroad has been marked from the time of its opening for traffic in 1907. The effect of the Panama Canal upon that railroad is, however, not a subject to be discussed in relation to the influence of the Canal on American railroads.

TRANSCONTINENTAL PERCENTAGES.

Professor Johnson shows that 22 per cent of the rail shipments to the Pacific Coast originates in New York, Boston and common points; that 13 per cent originates in Pittsburgh, Buffalo and common points; and 34 per cent of all such westbound freight originated on the Mississippi River and common points, and on the Missouri River and common points.

Several tables of Professor Johnson's compilation deal with westbound continental railroad class and commodity rates. Then follow tables dealing with eastbound and westbound water rates. The interrelation of intercoastal water rates and transcontinental rail rates is then made clear by a description of the "blanketing" method applied to large portions of the continental territory of the United States. This statement can be made clear by remarking that in all of eastern Illinois and the greater part of Wisconsin rate groups would be similar. This applies to ten other "blanketed" territories; for instance, rate groups apply as related to all of Mississippi, western Tennessee, part of Kentucky, all of Indiana, all of Ohio and the portion of Michigan bounded on the west by Lake Michigan and on the east by Lake Erie. These "blanketed" territories coincide in some measure to the rate zones that have been established by the Interstate Commerce Commission. After presenting every phase of the subject, Professor Johnson has come to certain definite conclusions, somewhat as follows:

Certain Conclusions

1. The Atlantic section of the United States will obtain a somewhat larger share of the trade of the Pacific coast and will secure more benefit of the cheap water routes than will the Middle West.

2. The middle section of the country will not, however, suffer from serious inroads upon its trade because, (a) the Middle West already has for its manufactures and other commodities, a firmly established hold upon the west coast trade; (b) co-operation between producers and rail carriers in the Middle West will enable them to compete successfully with Eastern producers not located in or near the Atlantic ports. (c) The Middle West will probably lose a part of the trade of the Pacific coast cities, but will hold nearly all of the trade of the intermountain states.

Lower Rates Eastward.

3. In Professor Johnson's opinion the trunk lines of the Atlantic seaboard will doubtless aid inland producers east and just west of the Alleghenys by making low through rates from places as far west as Cleveland and Indianapolis to the Pacific via the Atlantic ports and the Canal.

4. He also expects that the rail lines to the Gulf by a similar system will draw trade from Memphis and St. Louis and possibly from Kansas City to the Gulf for shipment to the Pacific coast via Gulf ports and the Canal.

Intermountain Trade.

5. On the other hand, Professor Johnson concludes that the transcontinental rail lines running west from Saint Paul, Chicago, St. Louis and the cities on the Missouri River may be expected to assist in building up the direct trade from the Mississippi and Missouri valleys to the cities in the intermountain states and thus aid the Middle West to resist the entry of goods into the intermountain states from Pacific coast points after shipment from the Eastern ports of the United States via the Canal.

Intermountain Rates Eastward.

6. It is anticipated that the intermountain states will probably secure lower freight rates for their trade with the Eastern section of the country and with the Middle West. At this point, we quote from Professor Johnson direct: "Instead of cutting deeply into the rates between the Eastern part of the United States and the Pacific coast terminals and thereby, under the rules of the Interstate Commerce Commission in the Spokane and Reno cases, automatically depressing all rates to intermediate points, the railroads will more probably decide to maintain fairly remunerative through rates to the west coast; to suffer the major share of the coast to coast traffic to be supplied by Eastern producers and to be carried through the canal; and to make only such reductions in the rates to and from the intermountain territory as may be required to cause that section to continue to trade mainly in the Middle West. The policy of the railroads will probably be to make it advantageous for the intermountain cities to trade less through Pacific coast jobbers and more, without the intervention of middlemen, directly with the Central and Eastern sections of the country."

Immediate Profits Lessened.

7. Relative to the general effect upon railroads Professor Johnson concludes that the immediate effect will be to lessen railroad profits. He is optimistic, however, in expecting the ultimate effect to lead to the enhancement of the prosperity of railroads, in that there is yet a great development to be anticipated in the Middle West, and that the rapid development of the Pacific coast due to the opening of the Panama Canal will lead to greater demands upon the traffic facilities of the nation both by water and by rail. Inasmuch as "the railroads connecting the Mississippi valley and the Pacific coast are among the most profitable lines in the United States," Professor Johnson holds out to these railroads an assurance that "the country they serve is certain to have a large development during the next quarter century, a development that will unquestionably be appreciably aided by the Panama Canal."

Toll Effects Negligible.

8. The final conclusion of Professor Johnson is that the exemption of coastwise steamships from the payment of Panama Canal tolls will have very slight appreciable effect upon the rates charged by the regular steamship lines. In any event, it would not average, in the opinion of Professor Johnson, more than sixty cents a ton. The remission of tolls will aid the owners of coastwise marine and not the shippers. Shippers who charter boats for handling of traffic will, however, be benefited by such remission.

The Traffic Department of the Panama-Pacific International Exposition

IT is safe to say that no exposition has faced so complicated a problem in transportation as does the Panama-Pacific International Exposition which will, in 1915, celebrate the completion of the Panama Canal. Indeed, it is the Canal itself which provides the final knot in the tangle of routes over which men, materials, and exhibits will travel to reach the Golden Gate; for the Canal and its functions in the shipping interests of the world, are, as yet, problematical factors; certainly there are no figures based on previous experience to indicate just how much of the traffic that will seek the West will pass through the Gatun Locks.

When to this natural problem, growing out of the completion of the canal, are added those accumulated problems that distance and variety of routes provide, it will be seen that Mr. A. M. Mortenson, chief of the Traffic Department of the Panama-Pacific International Exposition, has a task before him of the greatest magnitude and nicest discrimination, and though in a very vital sense the Panama Canal is essentially a maritime project, opening as it does a new marine route, by the same token its effect on all other modes of travel will be notable.

San Francisco's location at the extreme western edge of the American continent, the geographical location of the Exposition grounds, the fact that no trans-continental railroad has a terminal adjacent provide conditions unique in the history of transportation.

In discussing the subject recently Mr. Mortenson said:

"While rail transportation facilities are excellent and fully adequate during ordinary conditions, they are bound to become greatly congested in handling the immense passenger traffic in 1915. Extraordinary efforts will have to be made by all transcontinental lines to handle properly the unusual volume of business, and I realize that while these are primarily problems for the railroads to work out, it is the duty of the Traffic Department of the Exposition to co-operate and assist in every possible and proper way, as for instance by the preparation of estimates of the number of visitors to move.

"The movement of exhibits from all parts of the world and the rates to apply on such shipments are important matters to be handled by the Exposition's Traffic Department. Many thousands of tons of exhibits will be shipped from Europe, and the natural route, before the opening of the Canal, would be through the Atlantic or Gulf ports of entry, and thence via rail lines to San Francisco. But it appears that this routing will be changed when the Canal is opened.

"Already some of the Atlantic steamship lines have announced their intention of establishing a direct service from Europe to San Francisco in time to handle Exposition exhibits and passenger traffic. Docks are now being provided at Exposition grounds for the wharfage of such Atlantic-Pacific steamers so that these great liners may land direct at the grounds and discharge their cargo of exhibits, thus requiring but one handling after they have been loaded on the boat. A standard gauge railroad has been completed from the docks to the Exposition grounds, immediately adjacent, and spur tracks will provide easy approach to all of the main exhibit palaces and to other important points throughout the entire Exposition reservation.

It is interesting to note in this connection that the main line track will not be torn up on the opening of the Exposition, but that it will be buried, transversed by the foot paths and roads of the Exposition, and uncovered again when the doors of the Exposition are closed December 4th, 1915, thus providing against the necessity of rebuilding the line and avoiding its exposure to the scenic disadvantage of the landscape garden scheme.

Another element which is peculiar to the Exposition in San Francisco arises from the fact that there is no physical connection between the grounds and any railroad (except of course the Exposition's terminal line already described), and in order that carloads of building material not arriving by water, and later on, exhibits which come by rail could be delivered direct, a freight ferry slip has been constructed. Car barges operated by railway companies whose terminals are across the Bay in Oakland, are already landing at this slip. Some are equipped with their own motor power and others are moved by steam tug boats.

It is estimated that the gross weight of exhibits will reach 70,000 tons coming from every part of the world in quantities of from small packages to a complete and modern locomotive of the largest type. From 50,000 to 60,000 individual exhibitors will contribute.

A book of instructions is being compiled by the Traffic Department of the Exposition and will soon be ready for distribution which will cover all queries that may possibly arise in the minds of exhibitors concerning the handling of their material, its treatment on arrival in San Francisco and all such other data as it may be essential to know. Among other things the booklet will cover the following subjects:

United States customs regulations applying to exhibits.

Names of carriers, both railway and express, bonded to carry dutiable goods in bond.

List of important ports of entry.

Names of steamship lines offering direct service to San Francisco with ports of sailing.

Rates made by various carriers, both land and water, on exhibits.

Rules and regulations of carriers governing return shipments.

Rates for deliery of goods on Exposition grounds.

Rules and rates governing the removal of exhibits.

Instructions for packing, marking and labeling packages.

The Exposition Company, through its railroad department will issue return bills of lading to owners and exhibitors, and take complete charge of the exhibits from exhibit space after goods have been packed and made ready for return shipment. The most earnest efforts of the Traffic Department will be devoted to the proper handling of every shipment and each detail connected with the movement to and from the Exposition and the equitable treatment of every exhibitor whether his exhibit be large or small. In short, the Exposition Traffic Department will be at the service of the exhibitor and will handle for him all matters pertaining to the transportation of his shipment to and from the Exposition.

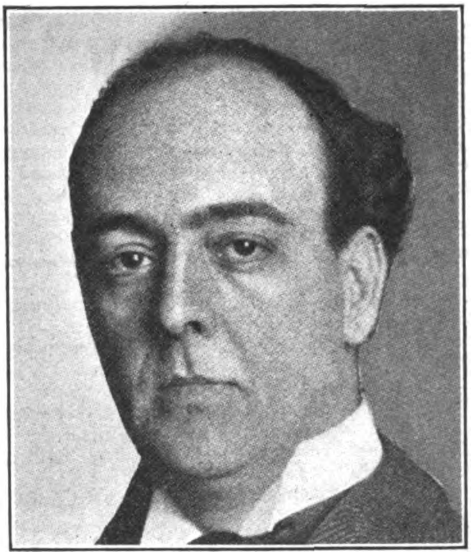
Thus it is seen that the Traffic Department will handle and come into close contact with almost every branch of transportation, including the operation of a busy terminal railway connecting with steamship docks, car barge freight slips, operating freight warehouses, storage warehouses, draying and trucking and motor buses, handling freight and passenger traffic in connection with steam and electric railways, steamships and ferries.

Missouri.

PROMINENT railroad officials told the State Public Service Commission on December 31st, that the railroads of Missouri are on the verge of bankruptcy, and unless business conditions for them improve several will go into the hands of receivers.

These declarations were made while the officials of the Missouri Pacific, Wabash, Chicago and Alton, and the Burlington were explaining to the Commission why it is necessary to take off the mail and passenger trains, which leave St. Louis at 11:30 P. M., for Kansas City. The companies announced they would discontinue those trains January 4th, to cut down expenses.

Personal



Frederic A. Delano.

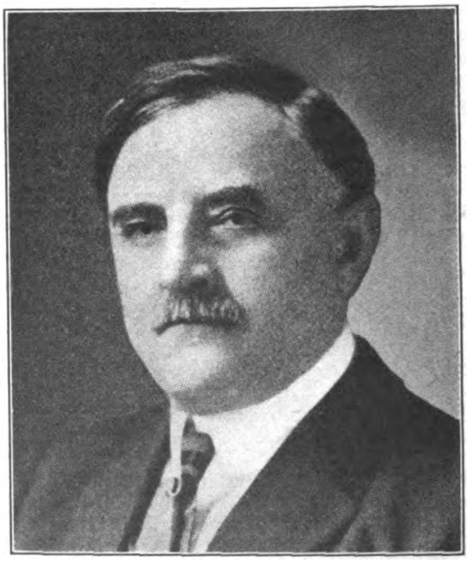
FREDERIC A. DELANO has resigned as president and receiver of the Wabash Railroad, to become president of the Chicago, Indianapolis and Louisville. Mr. Delano was born September 10, 1863, at Hong Kong, China. After graduating from Harvard University in 1885, he entered railway service as machinist apprentice in the shops of the Chicago, Burlington and Quincy. He remained with this road until January, 1905. From 1887 to 1889, he was head of the bureau of steel rail inspection tests and records; from 1889 to 1890, assistant to second vice-president; from 1890 to 1899, superintendent of freight terminals; from 1899 to 1901, superintendent of motive power, and from 1901 to 1905, general manager. He left the road in the latter year to become consulting engineer to the War Department and Philippine Commission, which position he held from March 15th to May 1st, of that year, when he again entered the services of the Wabash Railroad as first vice-president. Five months later, he was made president and for the past two years has also been receiver of that road. Mr. Delano was also president of the Wheeling and Lake Erie from 1905 to 1908, and has been president of the Wabash-Pittsburgh Terminal since 1905. He is a member of the Board of Overseers of Harvard College, of the American Society of Civil Engineers, of the American Institute of Mining Engineers of the Western Society of Engineers, of the Franklin Institute, of the American Railway Master Mechanics' Association, of the Master Car Builders" Association, of the International Railway Congress, and of the Western Railway Club.

Judge Adams, in accepting the resignation of Mr. Delano as receiver of the Wabash Railroad, paid him a high tribute for his honest, faithful and efficient work in connection with that property. He said:

"I take this occasion to express my personal regret that Mr. Delano feels impelled to tender his resignation as one of the receivers. He has been an honest, faithful and efficient public servant, and deserves well of all persons financially interested in the Wabash Railroad. The court will greatly miss his active assistance and wise counsel in the further administration of the trust. His most generous offer to render such assistance in the future as the exigencies of the case may from time to time require, is highly appreciated, and if at any time occasion arises when his great experience and knowledge will aid in the administration of the trust, the court, I am sure, will not hesitate to avail itself of his offer. I bespeak for him the greatest success in any field of enterprise to which he may devote himself."

Edward M. Hyzer.

EDWARD M. HYZER, who was recently elected vice-president of the Chicago Northwestern Railway Company, entered railway service in 1897, when ne took charge of the Wisconsin legal business of the Northwestern road under the then Wisconsin State attorney, Mr. John T. Fish, who was an able and experienced railroad lawyer, having been for a number of years general counsel for the Chicago, Milwaukee and St. Paul. Upon the death of Mr. Fish in 1900, Mr. Hyzer succeeded him as Wisconsin attorney for the Northwestern Road and conducted the legal business of that Company in that State until 1909, when he became general counsel of the Road with headquarters at Chicago, succeeding Honorable Lloyd W. Bowers, who retired from the position as general counsel to accept position of general solicitor of the United States at the request of President Taft. Mr. Hyzer's promotion to the position of vice-president does not affect his position as general counsel, the duties of which office he still retains.



EDWARD M. HYZER.

John Howe Peyton.

JOHN HOWE PEYTON, who on January 1st, became president and general manager of the Nashville, Chattanooga and St. Louis Railway, was born in Virginia in 1864. He is of English descent his ancestors having settled in the eastern part of Virginia in the seventeenth century. During his youth, he spent five years at Roanoke College, Salem, Va., taking the ordinary academic training. In 1881, when seventeen years of age, he secured a position as rodman on a corps of engineers under General Gabriel C. Wharton, an old ex-confederate general and since that time has devoted himself almost exclusively to engineering work. In 1902, he entered the services of the Louisville and Nashville as a locating engineer and in 1904, became principal locating engineer of this road. In 1907, he issued the first edition of "The American Transportation Problem," dealing with a comparison between transportation facilities afforded by inland waterways and modern railways; a second edition of this book was issued in the fall of 1909. In 1910, he became assistant to president of the Louisville and Nashville Railroad and in 1912, assistant to president and chief engineer of construction of that company. During the past two years he has been acting as assistant to president and chief engineer of construction of the Louisville and Nashville, having had under his personal charge the construction of about 500 miles of railroad, all of which are low grade lines and about 200 miles of which are double track. All this work has been and is being carried on in accordance with the most modern standards. Mr. Peyton's headquarters are at Nashville, Tenn.

William Frazer Owen.

WILLIAM FRAZER OWEN, who has recently been appointed receiver of the New Orleans, Mobile and Chicago Railroad Company, was born at Mobile, Ala., March 31, 1856. He entered the services of the New Orleans, Texas and Mobile Railway in 1871, and in 1880 joined the forces of the Morgan's Louisiana and Texas Railroad and Steamship Company and the Louisiana Western Railway Company, as master of transportation. In 1885, he was made superintendent of these companies and from February 1, 1906 to July 15, 1907, was president of a projected road known as the New Orleans, Crowley and Western Railway. On the latter date he became assistant to the president of the Mobile, Jackson and Kansas City Railroad and on September 1, 1907, was made general manager of this road. On December 1, 1909, the Mobile, Jackson and Kansas City was reorganized, becoming the New Orleans, Mobile and Chicago Railroad and at that time Mr. Owen was made vice-president and general manager, which position he held until January 1, 1912, when he became president and general manager. He continued as president of the road until his recent appointment as receiver.

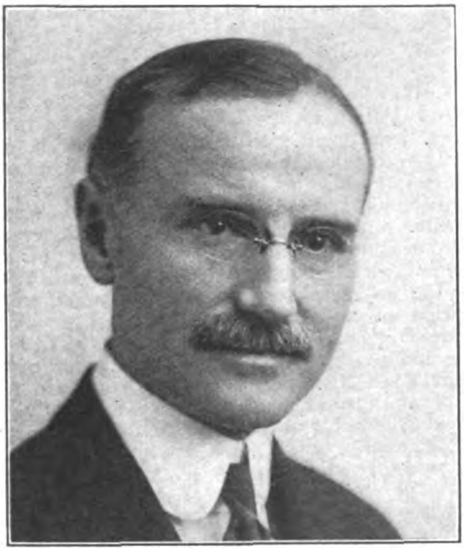
G. F. Turley.

G. F. TURLEY, who has been appointed general manager of the Virginian-Carolina Railway and the New River, Holston and Western Railroad, was born at Oakland, Md., December 20, 1867. After a public school education, he entered the services of the Shenandoah Valley Railroad in 1882, as clerk in the traffic department. From 1887 to 1889, he was clerk and telegraph operator at Hagerstown, Md., jointly for the Cumberland Valley and the Shenandoah Valley roads, and in 1889, became operator and chief clerk to the trainmaster and later despatcher and chief despatcher for the Shenandoah Division of the Norfolk and Western Railway. In 1902, he was promoted to the position of assistant trainmaster of the Pocahontas Division of the Norfolk and Western Railway and in 1905, was made trainmaster of the Shenandoah Division of the same road. In 1912, he became trainmaster of the Scioto Division of the Norfolk and Western, with headquarters at Portsmouth, Ohio. This position he held until his recent appointment as general manager.

G. F. TURLEY.

Robert Stevens Parsons.

ROBERT STEVENS PARSONS, who was recently made general manager of the Erie Lines West, with headquarters at Cleveland, Ohio, is a graduate of Rutgers College, having received the degree of civil engineer from this institution. He entered railway service in 1895, as rodman for the Erie Railroad and in 1896 became assistant engineer. In 1899 he accepted the position of division engineer for the New York, Susquehanna and Western but in 1903, returned to the Erie as engineer of maintenance of way. From this position he was promoted to that of assistant general superintendent, in 1906 and in 1907 was made superintendent of the Susquehanna Division, and three years later, superintendent of the New York Division. In 1913, he became assistant general manager, which position he held at the time of his recent promotion. Mr. Parsons is a member of the American Society of Civil Engineers.



J. T. Conley.

J. T. CONLEY, who on January 1st, became general freight agent of the Chicago, Milwaukee and St. Paul Railway, with headquarters at Chicago, began his railway service with this road as telegraph operator at La Crosse, Wis. Later he became traveling freight agent at Milwaukee and from this position, was promoted to division freight and commercial agent at St. Paul. In 1902, he was appointed assistant general freight agent at Minneapolis, which position he held until his recent appointment.

William C. Barnes.

WILLIAM C. BARNES has been appointed general freight agent of the El Paso and Southwestern System, with headquarters at El Paso, Texas. He was born February 9, 1877, at Senoia, Ga. He began railway work on October 21, 1891, as a mailing clerk in the accounting department of the Texas & Pacific, at Dallas, Texas, and was subsequently clerk in various capacities in the freight, accounting and freight claim departments of that road. In November, 1904, Mr. Barnes went with the El Paso-Northeastern System, now part of the El Paso-Southwestern System, as a rate clerk in the traffic department at El Paso, and he was made chief clerk to the general freight agent on January 1, 1908. From March 1, 1912, until January 1, 1914, the date when his appointment as general freight agent became effective, he was assistant general freight agent at El Paso.

John Marcus Davis.

JOHN M. DAVIS, who has recently been appointed assistant general manager of the Baltimore and Ohio Railroad, with headquarters at Cincinnati, was born November 5, 1871. He entered railway service in 1888 as a freight brakeman on the San Antonio and Arkansas Pass Railway. From September, 1891, to October, 1894, he was stenographer to the superintendent of the Gulf, Colorado and Santa Fe Railway, at Temple, Texas. Resigning this position, he became chief clerk to the superintendent of the Mexican Central Railway, at Tampico, Mexico, where he remained until October, 1895; and from then until March, 1896, was employed in the general manager's office of the Great Northern Railway, at Duluth, Minnesota.

Filling other positions of a clerical nature, Mr. Davis was made assistant superintendent of the Great Northern Railway, at Melrose, Minnesota, which position he filled from March to July, 1898. From that date until January, 1900, he was superintendent of the Breckenbridge and Montana Divisions of the Great Northern. Mr. Davis then entered the service of the Erie Railroad as superintendent at Scranton, Pa., where he was stationed until March, 1902, when he became superintendent of the Union Steamboat Line of the Erie, at Buffalo.

In August, 1902, he became superintendent of the Allegheny Division of the Erie, remaining until May, 1903. Returning to the Great Northern Railway, he was successively superintendent of the Superior, Dakota and Minot Divisions until July, 1905, when he was promoted to assistant general superintendent of the Central District, at Minot, N. D. Next he was assistant general superintendent of the Oregon Short Line, Union Pacific and Southern Pacific lines, with headquarters at Salt Lake City, until November, 1907, after which time he was acting general superintendent until June, 1908. Mr. Davis was next promoted to general superintendent of the Oregon Short Line and Southern Pacific Company in Nevada, filling such position until June, 1910. From this latter date to the present time he has been general superintendent of the Central District of the Southern Pacific Company, at San Francisco.

W. W. Miller.

W. W. MILLER, who on January 1st, became general freight agent of the Missouri, Kansas and Texas Railway with headquarters at St. Louis, entered railway service in the local freight agent's office of the St. Louis, Iron Mountain and Southern at Cairo, Ill., on August, 1883. In 1885, he accepted a position in the general freight office of the Texas and St. Louis Railway at Texarkana, Texas, and in 1889, was transferred to the general freight office of the Missouri, Kansas and Texas Railway at Sedalia, Mo. In 1893, he became commercial agent of this road at Kansas City and in 1896, general livestock agent at Fort Worth, Texas. In 1900, he was appointed assistant general freight agent with headquarters at Chicago and in 1902, was transferred to Kansas City, and in 1908 to St. Louis, where he remained until his recent promotion.

R. D. Williams.

R. D. WILLIAMS, who has been appointed assistant general freight agent of the Missouri, Kansas and Texas Railway, with headquarters at St. Louis, began his railway service with this road in 1883 as operator at Montrose, Mo. On January 1, 1897, he went to the local freight office at Kansas City as a clerk and on June 1, 1899, became chief clerk in the assistant general freight agent's office at that point. He was appointed traveling freight agent at Kansas City, January, 1907, which position he held until October, 1909, when he was transferred to St. Louis as chief clerk in the general freight office.

A. M. Burt.

A. M. BURT, who became chief engineer of maintenance and way of the Northern Pacific Railway Company, on January 1st, was born at Syracuse, New York, in 1866. He was educated in common schools and in preparatory schools in New York and Massachusetts, and entered railway service March, 1885, with the Engineering Department of the Colorado Midland Railway and served in various capacities from Rodman to Assistant Engineer with the Colorado Midland; Adirondack & St. Lawrence; Chicago & Northwestern; and Northern Pacific until December, 1897. He was appointed supervisor of Bridges and Buildings of the Northern Pacific Railway, at Minneapolis, Minn., in January, 1897, and served in this capacity until March 1, 1902. Appointed assistant superintendent, Minnesota Division, headquarters at Grand Forks, N. D., March 1st, 1902; served in this capacity until October 10, 1903. Division superintendent successively at Jamestown, Fargo, Missoula and Spokane, October 10, 1903 to December 31, 1913.

F. T. Beckett.

F. T. BECKETT, who on November 1st, was appointed engineer maintenance of way, of the Chicago, Rock Island and Pacific Railway, was born in 1870, at Frankfort, Kansas. He is a graduate of Kahoka College, Kahoka, Mo., and also of Valparaiso University, Indiana. He entered railway service in 1897, as chainman for the Atchison, Topeka and Santa Fe Railway at Corrallton, Mo., and later became rodman and then transit man and inspector for this road. In 1900 he joined the forces of the Chicago, Burlington and Quincy as assistant engineer, but in 1902, returned to the Santa Fe in the same capacity. In 1903, he was made assistant engineer in charge of maintenance work of the Rio Grande Division of the Santa Fe and in 1906, became assistant engineer on construction for the Western Oklahoma Railway, which is a part of the Santa Fe system. In 1907, he was made division engineer of the Oklahoma Division of the Atchison, Topeka and Santa Fe, engaged in maintenance work, and in 1908, became resident engineer of the E. P. & S. W. system, in charge of maintenance and construction work, which position he held at the time of his recent appointment.

W. G. Coughlin.

W. G. COUGHLIN, who on December 1st, was promoted to engineer maintenance of way of the Pennsylvania Railroad, was born in Florence, N. J., in 1862. He received his early education in the private and public schools of that vicinity and in 1875, entered the Farnum School in New Jersey.

Mr. Coughlin was a member of the exposition which was sent to South Africa in 1878, to construct the Midera and Mamore Railway in Brazil. He returned to the United States in 1879 and entered the service of the Pennsylvania Railroad in the construction department. In 1883, he was transferred to the position of assistant supervisor of the Baltimore Division and in 1886, was promoted to supervisor of the West Jersey and Seashore Railroad. In 1893, he returned to the Baltimore Division as division engineer and in 1900, was promoted to principal assistant engineer of the Erie Division of the Northern Central Railway. In 1903, he was made superintendent of the Elmira Division, and in 1907, became superintendent of the Renovo Division. He held this position until his recent promotion.

E. R. Scoville.

E. R. SCOVILLE, who is promoted from superintendent of the Ohio Division of the Baltimore and Ohio Southwestern Railroad at Chillicothe, O., to membership on the General Safety Committee, of the Baltimore and Ohio System, effective January 1st, was born August 1, 1858, at Bellefontaine, O. He first entered railroad service in September, 1876, as telegraph operator in the employ of the Big Four Railroad. January 10, 1879, he accepted a position with the Western Union Telegraph Company as operator, entering the service of the Baltimore and Ohio Southwestern on October 15th, of that year, in the same capacity. March 2, 1880, Mr. Scoville was advanced to block dispatcher, becoming train dispatcher at Chillicothe May 1, 1882. He was promoted to chief dispatcher there November 15, 1890, and was made train master of the Ohio Division, November 11, 1893. January 1, 1900, he was advanced to superintendent of telegraph at Cincinnati, being made superintendent of the Springfield Division at Flora, Ill., on November 8th, of that year. May 1, 1902, Mr. Scoville was made superintendent of the Illinois Division at Washington, Ind., having been transferred to Chillicothe, November 1, 1905, in which position he remained until his present promotion.

John Moore James.

JOHN MOORE JAMES, who has been made assistant superintendent of the Pittsburgh Division of the Pennsylvania Railroad, was born at Wellsville, Ohio, September 10, 1875. Was educated in the public schools of Wellsville and Ohio State University.

Mr. James entered the service of the Pennsylvania Railroad Company as machinist apprentice, in the Altoona shops, in 1893. He was appointed assistant foreman of Car Inspectors, Washington, D. C., May, 1899, and foreman of the Anacosta shops of the Philadelphia, Baltimore and Washington Railroad, January, 1900. He became general foreman, Washington, D. C., May, 1900; general inspector of the Buffalo and Allegheny Valley Division, October, 1900, and assistant engineer of motive power, Buffalo and Allegheny Valley Division, January, 1912. He was appointed master mechanic of the Olean shops, Buffalo and Allegheny Valley Division, on December, 1902; transferred to master mechanic of the Buffalo Division, November, 1908, and to the West Philadelphia shops, May 1, 1911.

On January 1, 1912, Mr. James was promoted to superintendent of motive power of the Western Pennsylvania Division, with headquarters at Pittsburgh, Pa., and on December 1, 1913, he was appointed assistant superintendent of the Pittsburgh Division.

F. B. Lincoln.

F. B. LINCOLN, who became general superintendent of the Erie Division of the Erie Railroad on January 1, 1914, was born in New York City on October 9, 1867. He was educated in the public schools of New York and Connecticut and at New York University. He entered railway service in the engineering corps of the Erie Railroad in 1887. He occupied respectively the positions of rodman, transitman and resident engineer, until June, 1892, when he became assistant engineer of the Allegheny Division. The latter part of the same year, he was made assistant engineer of the Susquehanna Division, which position he occupied until 1895, when he was made trainmaster of the Toby branch of the Erie Railroad in charge of maintenance and operating. In 1897, he became agent for the Erie Railroad at Salamanca and in 1898, accepted the position of superintendent of the Bloomsburg Coal Company. In March, 1902, he was made general manager of the Buffalo and Susquehanna Coal and Coke Company, and in October of the same year, became special agent for the vice-president and general manager of the Erie Railroad. In 1904, he went to the Delaware and Hudson Company as superintendent of the Susquehanna Division and the following year became superintendent of construction for that road. In October, 1905, he left railway service to become superintendent of construction of the O'Rourke Engineering and Construction Company, engaged on Grand Central Terminal work at New York City. This position he held but a few months, again entering railway service in March, 1906, as assistant to the receiver of the Pittsburgh, Shawmut and Northern Railway, which position he held until his recent appointment.

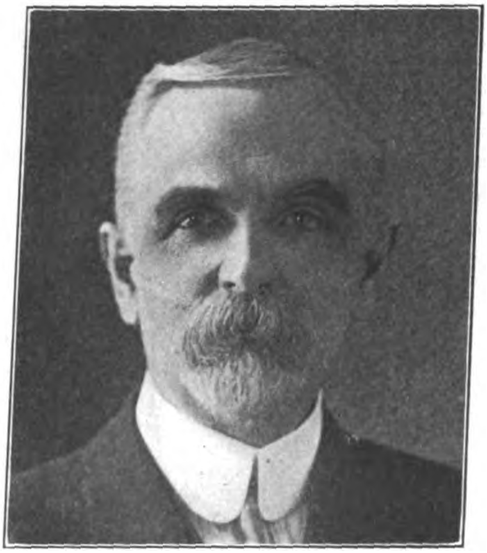
John Daniel Stack.

INCIDENT to the promotion of E. R. Scoville, formerly superintendent of the Ohio Division of the Baltimore and Ohio Southwestern Railroad to membership on the newly-organized General Safety Committee, J. D. Stack has been promoted to superintendent, succeeding Mr. Scoville. Mr. Stack was formerly assistant superintendent of the Toledo Division of the Cincinnati, Hamilton and Dayton Railway, a Baltimore and Ohio Line, with headquarters at Dayton, Ohio.

John Daniel Stack, the new superintendent, began his railroad career as a trucker, fireman and switchman on the Louisville, New Albany and Chicago Railroad, where he was employed from 1885 to 1887. He was telegraph operator on the Vandalia Line and the Big Four until 1889 and was later a train dispatcher at Bloomington, Ind. From 1891 to 1892, he was dispatcher and afterwards chief dispatcher of the Fort Worth and Rio Grande Railway, at Fort Worth, Texas, and from 1892 to 1895 was train dispatcher of the Atlantic and Pacific Railway, at Needles, Colorado.

His next railroad service was as train dispatcher of the Illinois Central at Centralia, Ill., Jackson, Miss., and Memphis, Tenn., where he was employed from 1895 to 1897; and from the latter date until 1900 he was train dispatcher of the Oregon Short Line and the Oregon Railroad and Navigation Company and the Union Pacific at Pocatello, Idaho. For a period of one year, or until 1901, Mr. Stack was dispatcher of the Southern Railway at Princeton, Ind., and for the next year filled the same position with the Denver and Rio Grande Railroad, at Minturn, Colo. From 1902 to 1904 he was dispatcher and chief dispatcher of the St. Louis and San Francisco road, at Springfield, Mo., and during the next year was train master of the I. M. & S. Road at Monroe, Louisiana. He was chief dispatcher, assistant superintendent and superintendent of the Colorado and Southern at Trinidad, Colo., from 1905 to 1909, and assistant superintendent of the Southern Pacific Company at Sacramento, Cal., for the next year. From 1910 to 1911 he was assistant general manager of the Oregon-Washington Railroad and Navigation Company and the Southern Pacific Lines in Oregon, with headquarters at Portland, Oregon. At the time of the separation of these lines, in 1911, Mr. Stack continued as superintendent and assistant general manager of the Oregon-Washington Line, resigning several months ago to enter the service of the Baltimore and Ohio System at Dayton, Ohio.

L. A. Lambert.



L. A. LAMBERT.

L. A. LAMBERT, who has recently been made auditor of miscellaneous receipts and accounts of the Baltimore and Ohio Railroad, was born on January 26, 1856, at Philadelphia. He entered railway service in 1873, as clerk in the freight department of the Baltimore and Ohio, and in 1877, became cashier of the express department of that road. In 1881, he was promoted to assistant to the general manager of the Baltimore and Ohio Express Company, and from 1884 to 1887, was superintendent of the same organization. In the latter year, the Baltimore and Ohio Express Company was sold to the United States Express Company, and from that year until 1890, Mr. Lambert was superintendent of the United States Express Company, when he resigned to engage in farming, although from that time until 1899, when he again regularly entered railway service as a traveling auditor of the Baltimore and Ohio's accounting department, he was constantly engaged in special work either for that road or for the express company. In 1902, he became chief clerk to the auditor of revenue and in 1903, his duties were made to include that of special agent. In 1907, he was promoted to special accountant, which position he held at the time of his recent appointment.

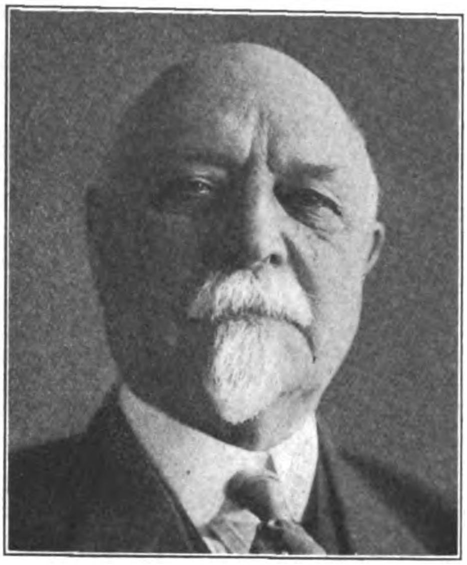
Obituary

Charles E. Ways.

CHARLES E. WAYS, who died in Baltimore on January 2nd, was widely known in railroad circles and it is believed that he enjoyed the distinction of the longest record of any of the officials of an American railroad, and his career was at the same time one of the most interesting in relation to the development of the country's railroads.

Mr. Ways was a native of Frederick County, Maryland, where he was born in 1838. He entered the service of the Baltimore and Ohio railroad in 1853, as a telegraph operator at Martinsburg, W. Va., and later at Frederick Junction. He became a pay-roll clerk on the Cumberland Division in 1859, and in 1861 was transferred to Washington as an operator. He was made chief operator with offices at Baltimore, in 1863. Four years later, Mr. Ways was appointed general agent of the Baltimore and Ohio at Hagerstown and was promoted in 1878 to division freight agent. He was advanced to assistant general freight agent in October, 1881, and in March, 1888, became general freight agent. He was promoted in 1897 to assistant general freight traffic manager, the position which he held until his death.

Probably no other railroad official in the country has had so interesting a career in transportation service as has Mr. Ways. In his earlier years of railroad service he was identified with the evolutionary period of the country's present railroad system, and during his service with



CHARLES E. WAYS.

the Baltimore and Ohio he lived to see that road developed from a small single-track line into one of the leading public carriers of the country.

Recently, Mr. Ways was presented with a silver medal in the form of a perpetual pass over the lines of the Baltimore and Ohio system, the management having tendered him this token of appreciation of his long years of active and useful service.

Commencing with the historic raid by John Brown and his band of abolitionist followers upon the United States arsenal at Harper''s Ferry, where Mr. Ways was employed at the time as a telegraph operator, the experiences of the late railroad official read like fiction. Mr. Ways sent the telegram which announced to the outside world the news of the attack upon Harper's Ferry, itself one of the most momentous events in the history of the United States.

Edmund C. Leavenworth.

THE Grand Rapids and Indiana Railway Company has lost a valued official in the death of their general freight agent, E. C. Leavenworth, who died on January 5th, after a short illness. His integrity, ability and loyalty to the interests he served made him a valuable officer and his loss will be deeply felt by all his associates, both in and out of the railway service.

Mr. Leavenworth was born in Detroit, Mich., on January 21, 1852. On September 18, 1871, he entered railway service with the Michigan, Lake Shore Railroad as agent at Allegan, Mich., this road being affiliated with the Grand Rapids and Indiana.

He remained at Allegan in this capacity until September 1, 1879, when he became traveling freight agent for the Grand Rapids and Indiana Railroad with headquarters at Grand Rapids. On January 1, 1881, he entered the general freight office in a clerical capacity and on January 1, 1884, he became chief clerk from which position he was promoted on May 1, 1889, to that of general freight agent. At the time of his death he was in his forty-third year of continuous service with the Grand Rapids and Indiana and affiliated lines.

E. J. Chism, general freight and passenger agent of the Chesapeake Steamship Co., died in his office at Baltimore, Md., on Wednesday afternoon, December 10th, from organic heart disease. Mr. Chism was between 58 and 59 years of age and had been with the Chesapeake Steamship Company for more than forty years. He was a member of the American Association of General Passenger & Ticket Agents, the Fraternal Society of the American Association of General Passenger & Ticket Agents and the American Association of Freight Traffic Officers and was prominently identified with the transportation business from the port of Baltimore. Mr. Chism was held in high personal esteem by the steamship and railroad fraternity in general and by Mr. Key Compton, president of the Chesapeake Steamship Company in particular.

James H. Crawford, secretary, treasurer and general manager of the Shippers' Refrigerating Car Company, Chicago, died on December 11th, at Chicago.

Dwight A. Jones, president of the Mississippi River & Bonne Terre, with headquarters at New York, died on December 7th, at St. Louis, Mo., at the age of 59.

Henry Martin, vice-president and general manager of the International & Great Northern Ry., was drowned December 5th, a result of the floods in southern Texas, which have caused great loss of life and property damage. Mr. Martin was crossing the Little Brazos River at Hearne, Tex., when the rowboat in which he was riding capsized. Mr. Martin was born in Springfield, Tenn., January 22, 1864. Early in life he entered the railroad service. For twenty years he was connected with the Queen

EDMUND C. LEAVENWORTH.

& Crescent route, later for six years with the Mobile & Ohio R. R. In 1908 he became connected with the International & Great Northern Railway and for the last three years he has been located at Houston, being in charge of the general offices.

H. E. Montague, traveling passenger agent of the Southern Pacific Company, according to press reports, was shot and instantly killed on December 1st, while trying to disarm a highwayman, who was holding up the passengers on a Southern Pacific westbound train, thirty miles east of Los Angeles, Cal.

Charles S. Musson, traveling freight agent of the New York, Chicago & St. Louis R. R., with headquarters in Chicago, died at his home in a suburb of that city, December 14th. He was born in Toronto, Ont., December 23, 1844, and had been with the railroad company since 1888.

A. B. Phillips, general foreman of the Denver & Rio Grande R. R., Salt Lake City, Utah, died in that city December 6th.

Mitchell D. Rhame, for many years connected with the Engineering department of the Chicago, Milwaukee & St. Paul Railway, died at his home in Minneapolis, on December 9, 1913.

Mr. Rhame was born October 12, 1846, at East Rockaway, New York, graduated from Yale in 1869 and then took a one-year post-graduate course at the Sheffield Scientific School. Upon leaving school Mr. Rhame entered the service of the United States Government as assistant engineer and was assigned to a survey of the Illinois River with headquarters at Peoria. While at Peoria, Mr. W. W. Folwell, president of the University of Minnesota, became interested in him and offered him the position of professor of mathematics and engineering at that institution, which position he held from 1872 to 1880. After severing his connection with the University of Minnesota, Mr. Rhame entered the services of the Chicago, Milwaukee & St. Paul Railway as assistant engineer, on March 4, 1881, afterwards holding the titles of division engineer from 1891 to 1905, engineer of construction, 1905 to 1908, district engineer from 1908 to September, 1913, when he resigned on account of ill health. Among the more important works handled by Mr. Rhame during his connection with this road were the building of the South Minneapolis shops and terminal facilities, the construction of various new lines, viz.: Farmington to Mankato, Faribault to Zumbrota, Woonsocket to Wessington Springs; Bowdle, S. D., to the Missouri River, the revision and double tracking of the River Division from St. Paul to La Crosse, and finally the construction of 200 miles of the Puget Sound line from the Missouri River to the Montana State line near Marmarth.

George Stilson, roadmaster of the Grand Trunk Railway, at Hamilton, Ont., died December 5th.

David S. Sutherland, general agent and former division superintendent of the Michigan Central Railroad, died at his home in Detroit, Mich., December 17th, aged 64 years.

John W. Thomas, Jr., president and general manager of the Nashville, Chattanooga & St. Louis, died on December 17th, at his home in Nashville, Tenn. He was a son of the late Major J. W. Thomas, former president of the road. J. W. Thomas, Jr., was born at Murfreesboro, Tenn., in 1856. After graduating from Vanderbilt College, he entered railroad service in 1878, and for the next three years was a locomotive engineer on the Nashville, Chattanooga & St. Louis. In the succeeding two years he was a trainmaster; for two more years, engineer, conductor, operator and office man; for three years to 1889, purchasing agent and secretary to the president and general manager. For the next ten years he held the positions of assistant general manager and purchasing agent, becoming general manager in 1899. In 1906 he advanced to the presidency of the road, holding also the position of general manager.

Financial

The Outlook for 1914.

UNDOUBTEDLY a brighter financial outlook marks the new year's opening. The disturbing influences which were so characteristic of the year 1913, have in many instances, largely spent their force and a more peaceful and constructive period during the current year, is anticipated.

Railway officials generally, while not anticipating a rapid recovery, have hopes that the situation will continue to improve and that normal conditions may arrive towards the latter part of the year. Certain it is, that much depends upon the decision of the Interstate Commerce Commission in the advance rate case. Should their attitude be liberal in this matter, and should the carriers receive the full five per cent increase which they have asked for, this in itself, would do much towards bringing back a nation-wide prosperity. Railway securities during the past year have virtually been a drug on the market, and, in fact very little has been done in the way of issuing new securities, except under the spur of an imperative and immediate necessity.

However, the outlook is brighter. The passage of the tariff bill, which has now been long enough in effect to fairly measure its influence, has not brought about the serious disturbances which were prophesied for it. While readjustments in many lines of business still continue and may be expected for some time to come, they have not been of such a drastic character, as was at one time feared, and it is hoped that they will decrease in severity from now on. The passage of the currency bill in its final form, has caused a sigh of relief to go up from financial quarters. At one time it looked practically impossible that a measure so sane, and in the main beneficial to business, could have passed the present Congress. The administration is undoubtedly to be congratulated upon the results of its efforts, and prominent financiers have not been slow in voicing their praise of the new law.

The country is, of course, fundamentally sound. Its natural resources are enormous and to a large extent, remain practically undeveloped. Furthermore, it is still young enough to feel quickly the stimulation of restored confidence and recent developments point to a better feeling among business men and financiers. Unless the unexpected happens, the year 1914 should witness the development of sounder financial and business policies with their accruing beneficial results and should see the prosperity of the country on a more stable basis than it has been for a number of years past. Big business is, in itself, aiding the restoration of this confidence by its voluntary action to conduct its activities strictly along the lines of the Sherman anti-trust law, as evidenced by the action recently taken by the American Telephone and Telegraph Company, by J. Pierpont Morgan and other prominent financiers and by the New Haven system.

A brief review of the twelve months recently ended, shows it beginning under a sharp momentum but slackening by the middle of the year and reaching a low point of depression towards its close. Besides the railway situation, politics, new business legislation, conditions in Mexico and the partial failure of the grain crops all had their effect.

Bank clearings roughly measure the general business tendency. In the first two months they gained 6.5 per cent. By the end of June this gain had disappeared. In the last half of the year total clearings have shrunk 5.1 per cent, resulting in net loss of three per cent for the twelve months. It is to be noted, however, that all the loss is confined to New York, clearings outside slightly more than breaking even. Last year New York gained 8.6 per cent and the rest of the country 8.9 per cent over 1911.

New financing during the year particularly emphasizes the adverse monetary and investment conditions which existed. Capital applications announced by American railroad and industrial corporations during the past twelve months represented $1,645,736,200. This compares with $2,253,587,300 in the previous year. No attempt is made in this compilation to distinguish between capital required for new enterprises or extensions and that necessary to pay off or refund maturing obligations, which would probably furnish about twenty or thirty per cent of the total. In this connection, there is almost $600,000,000 of corporate securities maturing in 1914, including $400,000,000 railroad bond and short-term notes.

The following table, compiled from the records of "The Journal of Commerce and Commercial Bulletin" shows a summary of the year's financing, with comparisons:

RAILROADS.

	1913.	1912.	Changes.
Bonds ...	$414,081,000	$503,714,500	—$89,633,500
Notes	398,361,200	346,310,300	+ 52,050,900
Stocks ...	141,491,100	246,027,000	—104,535,900
Total ..	$953,933,300	$1,096,051,800	—$142,118,500

INDUSTRIAL CORPORATIONS.

Bonds ...	$225,190,000	$379,354,700	—$154,164,700
Notes	156,245,000	120,075,000	+ 36,170,000
Stocks ...	310,367,900	658,105,800	— 347,737,900
Total ..	$691,802,900	$1,157,535,500	—$465,732,600
Grand t'l	$1,645,736,200	$2,253,587,300	—$607,851,100

The foregoing totals do not include State and municipal bonds. A compilation covering the latter appears in an adjoining column.

A few Canadian railroads—Canadian Pacific, Canadian Northern and Grand Trunk—are included in the total because of their close connection with the trade and commerce of the United States.

NEW ISSUES FOR TWELVE MONTHS.

The principal divisions of the new securities, including bonds, notes and stocks, for twelve months:

	1913.	1912.	Changes.
Railroads .	816,332,100	$716,628,600	— $99,703,500
Tract'ns .	137,601,200	379,433,200	— 241,822,000
Pub. util..	299,524,700	384,244,200	— 84,719,500
Mfg. Cos.:			
Iron & st'l	16,990,000	83,121,500	— 66,131,500
Textiles .	27,125,000	43,008,000	— 15,883,000
Miscell. .	184,364,200	332,651,500	— 148,287,300
Miscell. ..	163,799,000	314,510,300	— 150,711,300
Total .	$1,645,736,200	$2,253,587,300	—$607,851,100

For the month of December:

Railroads .	$27,832,000	$4,650,000	+ $23,182,000
Tract'ns .	11,024,200	66,774,000	— 55,749,800
Pub. util..	11,884,000	38,874,000	— 26,990,000
Mfg. Cos.:			
Iron & st'l	250,000	2,500,000	— 2,250,000
Textiles .	700,000	6,550,000	— 5,850,000
Miscell. .	4,559,200	24,340,800	— 19,781,600
Miscell. .	16,900,000	18,800,000	— 1,900,000
Total ..	$73,149,400	$162,488,800	— $89,339,400

The "Journal of Commerce" in discussing the above statistical statement, has the following to say:

"Dividing the year into two parts, the first six months contributed about seventy per cent of the total. Upon the whole, circumstances here and in Europe did not favor those seeking new capital and applications to this end were deferred wherever possible. In fact, only where the financial needs were absolutely urgent and could not be delayed did the transportation and industrial interests endeavor to satisfy their requirements, so that temporary financing, so-called, in Wall Street was quite a feature in some months.

"Bank officials were, moreover, recommending borrowers to go slow in various directions. During the early months corporations hitherto enjoying the highest standard of credit, like the St. Paul, New York Central and Lake Shore railroads were compelled to pay the dearest rates in a number of years. In Europe, the congestion of securities was even greater than here, and many of the later syndicates were left with seventy or ninety per cent of the securities they undertook to float. In no small number of cases short term notes have been renewed more than once and railroads are desirous of replacing them with long time bonds, first to secure accommodation at lower rates of interest and second to prevent, if possible, the constant renewals of short term obligations, so troublesome and costly."

Railway Purchases and General Business

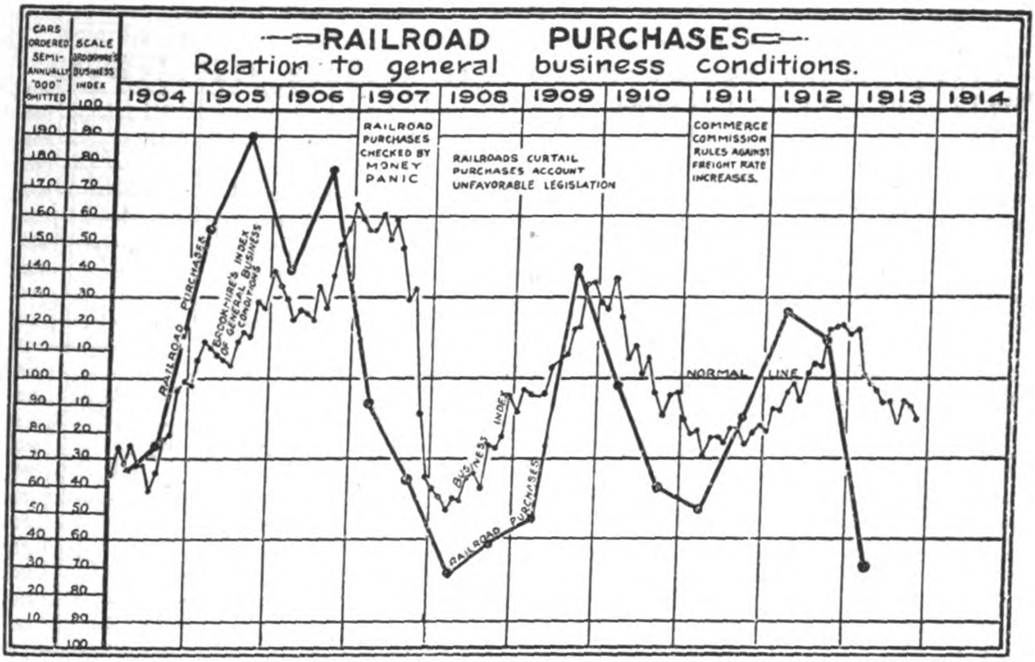


Chart prepared by E. B. Leigh, President, Chicago Railway Equipment Co., from Statistics of Car Orders and the Index to General Business Conditions issued by Brookmire, the St. Louis statistician, to show how closely revivals follow resumption of railway purchases, and recessions follow decline in railway purchases.

Railway Revenues and Expenses for October.

THE Bureau of Railway Economics at Washington, has issued a summary of the revenues and expenses of steam roads of the United States for the month of October, 1913. These returns reduced to a per mile of line basis, and compared with the returns for October, 1912, show a decrease in total operating revenues per mile, of 1.3 per cent, and an increase in operating expenses per mile of 5.3 per cent. Net operating revenue per mile, was less by $60 or 12.4 per cent, than for October, 1912, while that for October, 1912, was 14.4 per cent greater than for October, 1911.

The railways whose returns are included in this summary operate 224,537 miles of line or about ninety per cent of the steam railway mileage in the United States. The operating revenues for the month of October, 1913, amounted to $290,605,915. This includes revenues from freight and passenger traffic, from carrying mail and express, and from miscellaneous sources connected with rail operation. Compared with October, 1912, the total operating revenues show a decrease of $1,516,225. The total operating revenues per mile of line averaged $1,294 in October, 1913, and $1,311 in October, 1912, a decrease of $17, or 1.3 per cent. Freight revenue per mile decreased 2.5 per cent while passenger revenue per mile increased 1.2 per cent.

Operating expenses, which include all the costs of maintaining track and equipment, operating trains, securing traffic, and of administration, amounted to $195,338,456. This was $11,158,090 more than for October, 1912. These operating expenses per mile of line averaged $870 in October, 1913 and $827 in October, 1912, an increase of $43 per mile, or 5.3 per cent.

Net operating revenue, that is, total operating revenue less operating expenses, amounted to $95,267,459. This was $12,674,315 less than for October, 1912. Net operating revenue per mile of line averaged $424 in October, 1913 and $484 in October, 1912, a decrease of $60 per mile, or 12.4 per cent.

Taxes for the month of October amounted to $11,494,344, or $51 per mile, an increase of 11.7 per cent over October, 1912.

Operating income, which is net revenue from rail and outside operations, less taxes, averaged $373 per mile of line, and in October, 1912, $441, thus decreasing $68, or 15.4 per cent. Operating income for each mile of line for each day in October averaged $12.04 and for October, 1912, $14.23. Operating income is that proportion of their receipts which remains available to the railways for rentals, interest on bonds, appropriations for betterments, improvements, new construction, and for dividends.

The operating ratio for October, that is, the per cent of total operating revenues absorbed in operating expenses, was 67.2 per cent, which is comparable with 67.3 per cent in September, 1913, and 63.0 per cent in October, 1912.

A Business Condition Map.

THROUGH the courtesy of the Secretary of the Chamber of Commerce of the United States, we are able to print herewith, the first map prepared by the Committee on Statistics and Standards of the National Chamber, indicating the business conditions in the United States during the closing weeks of 1913. Maps of this character, accompanied by a general condition report covering the entire country, will, in the future, be a part of the regular service rendered by the National Chamber of Commerce to its members; and, it is hardly necessary to state, will be greatly appreciated by all those interested or concerned in the country's industrial and commercial progress. As the map indicates, business conditions throughout the United States at the close of 1913, were generally fair, the regions from which poor business was reported, being largely offset by areas from which reports were received of good business. The map is of particular interest as indicating the areas affected by crop conditions and the iron and steel industry.

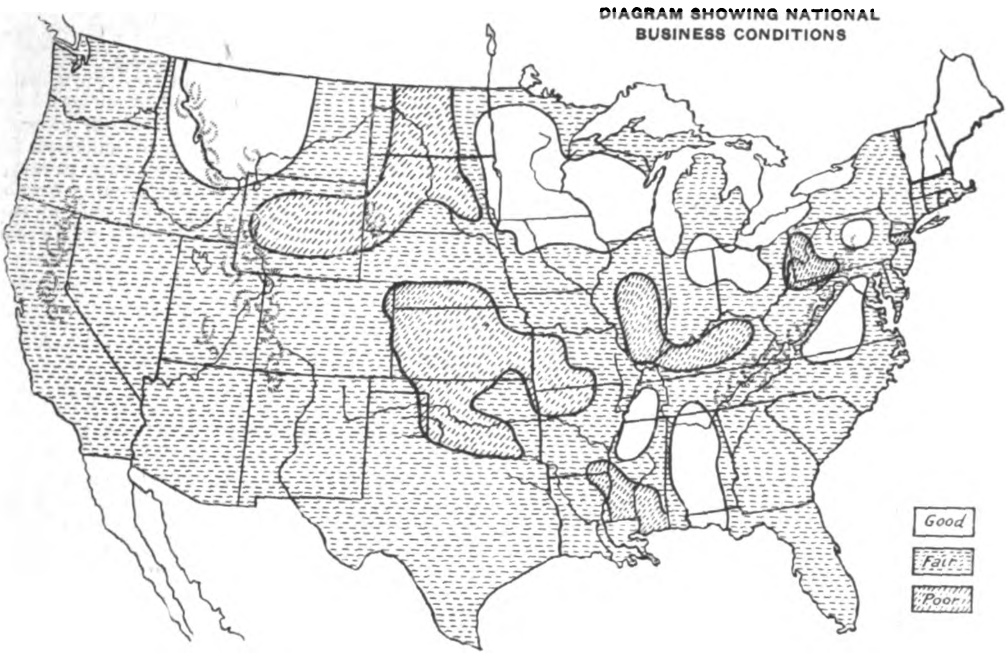

DIAGRAM SHOWING NATIONAL BUSINESS CONDITIONS

Trend of Stock Prices.

THE following diagram prepared by the *Magazine of Wall Street,* shows the trend of stock prices during the past three calendar years. The statement for December, 1913, is incomplete, showing only the first fifteen days, but indicates very little variation from the November averages. So far during January, there has been a distinct upward trend in a number of important issues, so that this month is likely to develop more favorable results.

Remarkable Record of Virginian Railway.

THE report of the Virginian Railway to the Interstate Commerce Commission for November, discloses the fact that the railway broke the world's record for hauling freight over land at low cost.

The report shows that the road was operated for 47 per cent of the gross intake, made 56 cents every time it received $1, and hauled a ton of freight three miles for a trifle less than one penny, United States money.

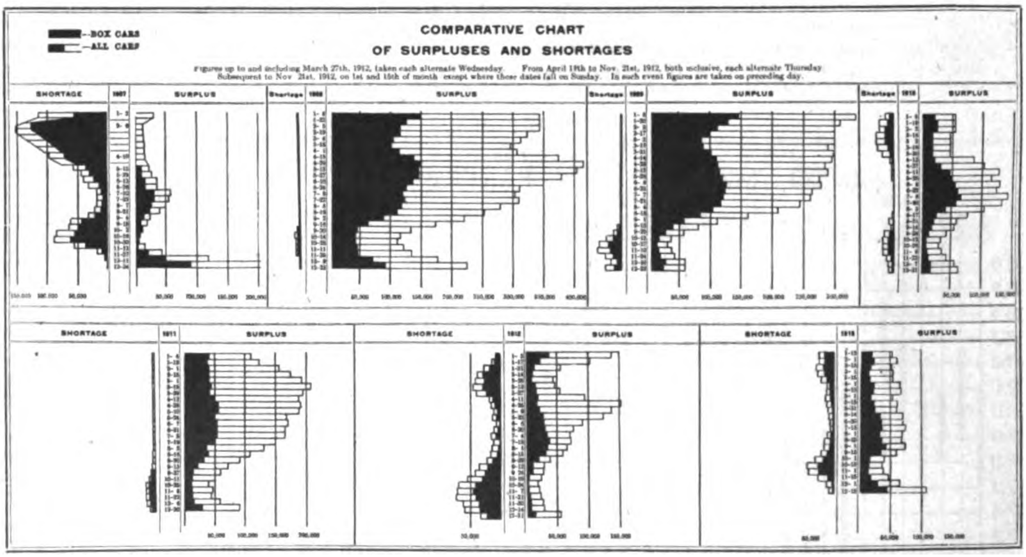
Raymond Du Puy, vice-president and general manager of the road, in commenting on the general results obtained for November, said:

"We had our best month, so far. We operated for a fraction under 47 per cent of our gross, and it was not done at the expense of the property. Last year we spent for upkeep of equipment $4,137 on each locomotive; $735 on each passenger coach, about $46 on each freight car. We also spent $1,508 for maintaining each mile of road and this year we are even increasing maintenance charges."

Operation

The Car Situation on December 15th.

THE Committee on Relations between railroads of the American Railway Association, reports that on December 15th, 1913, there was a total surplus of 107,513 cars compared with 67,466 on December 1st of the same year, and 26,614 on December 14, 1912. The same report shows that shortages on December 15, 1913, numbered 5,968 cars, while on December 1, 1913, they were 10,212 and on December 14, 1912, 61,006 cars. These figures indicate a net surplus on December 15, 1913, of over 100,000 cars against a net shortage on December 14, 1912, of more than 34,000 cars, strikingly indicating the difference in the car demand as between these two dates.



Northwestern Safety Organization.

AN interesting map is herewith presented showing the safety organization as it has been developed on the Chicago Northwestern Railway. At the present time there are 972 members belonging to this organization, of which nineteen belong to the two Central Safety Committees, one at Chicago with eleven members and the other at St. Paul with eight members. The balance of the membership is divided up as follows: Division committees 452; local committees 140; terminal committees 130 and shop committees 231. On the map stars indicate the location of the central safety committees, circles with dark centers the location of division safety committees, squares with dark centers the location of local safety committees, circles with crosses the location of shop safety committees and squares with crosses the location of terminal safety committees.

Safety Record on the Pennsylvania.

Reports to the general office of the Pennsylvania Railroad indicate that not a single passenger out of 111,000,000 carried by the Pennsylvania Railroad Company in 1913 was killed in a train accident.

Reports for the past six years show that almost 600,000,000 passengers—more than one-third of the whole world's population—have been carried by the Pennsylvania Railroad, and but sixteen of them lost their lives in accidents to trains; nine were killed in one accident. In six years, out of approximately 5,000,000 trains operated—about 1,370 a day—only five have suffered wrecks which caused the death of any of the passengers carried on them. Three of these years were entirely free from train accidents causing the death of passengers.

The Pennsylvania Management regards every accident of any kind on its property as one too many. Every effort is being continually directed to the end that the number of accidents of all kinds may be steadily reduced, and if possible, prevented.

The safety first campaign on the Pennsylvania

Railroad system has been for some time highly organized, but efforts along these lines have been redoubled in recent years. During the past four years this railroad has had thirty-five committees of employes on its lines East of Pittsburgh, investigating, recommending and warning, and has already spent nearly $500,000 in following these special recommendations in small matters, altogether aside from larger expenditures in signals, steel cars and other more obvious safety appliances. Since 1910, the various safety committees have made 17,333 recommendations, 13,861 of which have been adopted. One result of which is that exactly 99,753 safety guards of all kinds have been installed. Another, and more significant result, is that thirty-five out of forty-six shops where more than 500 men are employed, the number of serious accidents per one thousand men, has been reduced by from five per cent, in some cases to seventy per cent in others. Where one Pennsylvania Railroad employe was interested in the safety movement four years ago, there are hundreds to-day, and up to date, some 120,000 safety buttons have been distributed.

An interesting feature of this work has been a "safety first" exposition recently held in the

Rubber Blankets Should be Employed When Working Over Third Rail, Thus Guarding Body or Tools From Coming in Contact Therewith.

This Employe Invites an Explosion by Lighting a Cigarette While Sitting on a Can of Gasoline.

Y. M. C. A. quarters of the Pennsylvania Station at New York. This remained open for a week and was visited by about 4,000 persons, mostly employes. The accompanying photographs show some of the devices and methods employed at this exposition to emphasize various phases of the greater safety work.

In brief, the Pennsylvania Railroad is making a concerted effort to develop the operation of the road to the highest possible standard of efficiency and safety, and to this end all departments are co-operating.

Baltimore and Ohio's Improved Safety Results.

In a review of the statistics of accidents of all classes occurring on the Baltimore and Ohio—Cincinnati, Hamilton and Dayton system during 1913, the General Safety Committee has issued a bulletin setting forth that there has been a decrease of twenty-six in the number of fatal accidents, or twenty per cent. During the same period there was a substantial increase in the train mileage, occasioned by the increased business handled.

"This must be very gratifying to the employes," reads the bulletin, "and should prove a great incentive to their doing still better during the coming year."

The records of the signal department of the Baltimore and Ohio Railroad show that about $1,000,000 has been expended in this character of improvements during 1913. This money has been used in installing block signals of the latest design for the protection of the traveling public and as a safe-guard in the movement of traffic until now the main lines of the company are protected entirely by improved signalling systems. The expenditures during the past year for this class of betterment work brings the total cost of the signal systems in use on the Baltimore and Ohio lines up to about $5,000,000.

The Baltimore and Ohio has also announced that it will begin the new year by starting an unusually extensive and systematic campaign against accidents and their causes. This includes the reorganization of the General Safety Committee which will in the future be composed of seven members including the chairman, and an official from the transportation, motive power, maintenance of way, stations and traffic, and the relief departments, together with a former inspector of the Interstate Commerce Commission, all of whom will be relieved of other duties and will devote their entire time to studying the question of safety operation. There will also be an advisory committee acting in conjunction with the General Safety Committee.

The General Safety Committee is J. G. Pangborn, chairman; E. R. Scoville, for several years a division superintendent, representing the transportation department; John Hair, formerly superintendent of motive power, representing the mechanical branch of the service; W. McC. Bond, formerly division engineer, representing the maintenance of way department; J. T. Campbell, of several years' experience as an agent, representing the stations and traffic department; Dr. E. M. Partlett, representing the relief department and matters of sanitation, and B. C. Craig, who for the past nine years has been an inspector of railway safety appliances in the employ of the government.

The Advisory Committee consists of A. Hunter Boyd, Jr., of the law department of the company, and chairman of the Baltimore and Ohio General Safety Committee when the work was inaugurated nearly three years ago; J. W. Coon, of the operating department, also for a year or more chairman of the "Safety First" movement,

BALTIMORE & OHIO RAILROAD

BALTIMORE AND OHIO'S RECENT SAFETY EXHIBIT AT NEW YORK CITY.

and Dr. J. F. Tearney, of the relief department and formerly member of the General Committee.

One day each month will be designated as Safety Day on each division, when the members of the General Safety Committee will confer with local committeemen, make an inspection of terminals, yards, shops, stations, freight houses and other railroad property. It is expected that the General Safety Committee will spend a large part of the time on the road during the next several months, putting in a complete organization and becoming familiar with conditions on all parts of the system.

The accompanying photograph gives an interesting glimpse of the Baltimore and Ohio's "Safety First" installation at the International Safety and Sanitation Exposition of that Company at the Grand Central Palace, New York, in December. The exhibit of the Baltimore and Ohio occupied 400 sq. ft. of floor space and included full size models, working reproductions and photographs of equipment fitted up with the latest safety appliances. The exhibit also calls attention to the plans which have been carried out in the shops, on the tracks and in other branches of the service in an effort to prevent accidents. An interesting feature of the exhibit, as indicated in the photograph, is a "Safety First" clock, shown in the foreground of the picture and built and used by the men in the Mount Clare shops in Baltimore. As the clock strikes the hour and half hour, an automatic signal surmounting it goes to the danger position, a locomotive whistle blows to indicate that the signal has been observed by the engineer, and a set of safety rules are displayed.

The Results of Excessive Speed.

THE chief inspector of safety appliances of the Interstate Commerce Commission, has issued a report covering an investigation of the derailment of a passenger train on the Mobile and Ohio Railway, near Buckatonna, Miss., which occurred on October 19, 1913, and which resulted in the death of seventeen passengers and the injury of one hundred and thirty-nine passengers and six employes.

After an exhaustive investigation, the chief inspector has arrived at the conclusion that the accident was due to excessive speed in rounding a curve, which caused the derailment of the forward wheels on the tender and which, in pounding the ties of a bridge reached almost immediately after the derailment, caused them to be bunched and broken and so weakened the structure that it collapsed under the weight of the cars, throwing them to the bed of the creek.

The investigation disclosed that the bridge was built in a substantial manner and under ordinary circumstances, would not have collapsed under the train. Track and road bed were also found to be in excellent condition, so that the derailment, so far as the investigation could determine, must have been caused by excessive speed which the report estimates at about fifty-five miles an hour, although the engineer was of the opinion that he was traveling at a rate of only about thirty-five miles per hour. The following illustration gives an excellent idea of the havoc wrought. The investigation also disclosed that the engineman was practically inexperienced in passenger train operation work, it being the second time he had ever run a train of this character.

The report calls special attention to the extent that excessive speed has been a contributing factor to many derailments. In this particular the following table, which shows the derailments investigated since July 1, 1911, in which the speed of the train was either the primary cause or the contributing cause of the accident, will prove of interest to railway officials:

Railroad.	Date	No. killed.	No. injured.	Cause.
Oregon Trunk	July 10, 1911	5	35	Excessive speed on curve; engineman did not observe slow order.
Lake Erie & Pittsburgh	Sept. 13, 1911	4	16	Backing up over new track at excessive speed.
New York Central & Hudson River ..	Mar. 13, 1912	..	48	Spread rails on curve due to track structure failing to support heavy train at high speed.
New Orleans & North Eastern	May 6, 1912	9	58	Soft and uneven roadbed and excessive speed in view of this condition.
Chicago & Alton	June 8, 1912	..	24	Track unsafe for speed permitted; low spot.
Nashville, Chattanooga & St. Louis ..	June 12, 1912	3	75	Excessive speed on curve.
Illinois Central	do	..	9	Excessive speed over bad track.
Southern	July 17, 1912	1	52	Excessive speed on curve.
Chicago, Milwaukee & Puget Sound ..	Aug. 12, 1912	5	10	Do.
Cincinnati, Hamilton & Dayton	Aug. 25, 1912	1	25	Track unsafe for speed permitted.
Southern	Sept. 5, 1912	1	25	Excessive speed on curve; low spot.
New York, Chicago & St. Louis	Sept. 10, 1912	..	29	Excessive speed in view of existing track conditions; track being repaired.
Louisville & Nashville	Oct. 12, 1912	2	38	Excessive speed on curve.
Norfolk & Western	Oct. 20, 1912	1	13	Do.
Houston & Texas Central	Feb. 1, 1913	2	9	Defective engine equipment; excessive speed in view of existing track conditions.
Northern Pacific	May 12, 1913	4	7	Excessive speed in view of existing track conditions; track being repaired; spread rails.

In discussing this table the report states:

"Of the sixteen derailments shown, seven occurred on straight track and nine occurred on curves. With three exceptions all of the trains involved were being operated either within the speed limits allowed at the point of derailment or under no restriction whatever. These cases were the first, thirteenth, and fourteenth accidents shown in this table, and the speed limits were ten, forty-five and twenty-five miles per hour, respectively. Had these restrictions been heeded the accidents no doubt would have been averted. In the other thirteen cases, however, there were no speed restrictions whatever in effect, although the investigations of these accidents disclosed the need of such restrictions. As stated in a previous report, a study of the conditions surrounding several of the derailments investigated 'emphasizes the fact that in many places and on many roads in this country track is not properly constructed or sufficiently well maintained to provide for the safe operation of trains at high speed. It is believed that means should be taken to ascertain the limit of speed at which trains can be safely operated and to

Wreck on Mobile and Ohio, Showing Derailed Cars and Manner in Which Ties on End of Bridge Were Broken.

provide an adequate margin between this limit of safety and the highest speed permitted or attained.'

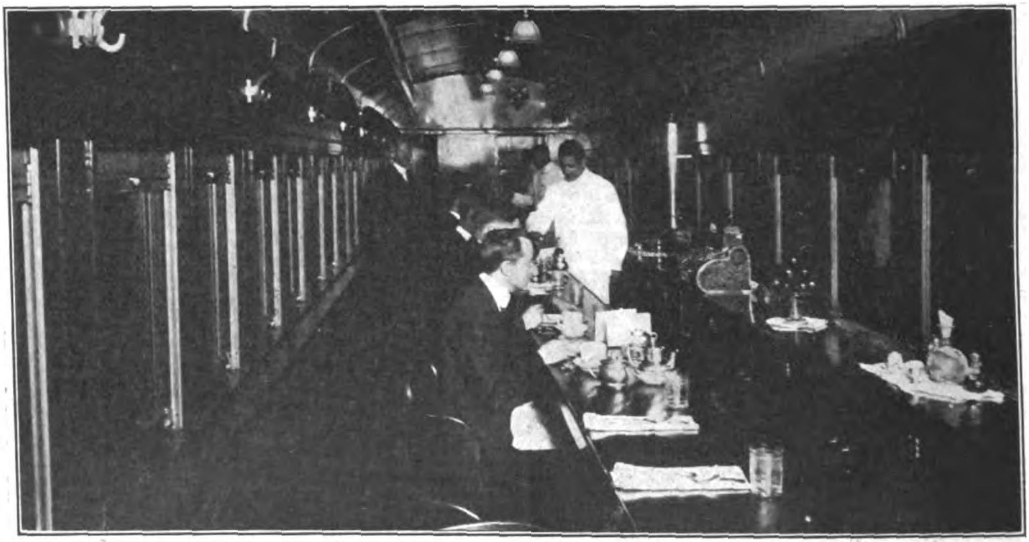
"Eleven of the derailments shown were what are known as tender derailments, the forward tender wheels usually being the first to leave the rails. Derailments of this kind form one of the most perplexing problems with which operating and mechanical officers have to contend. They result from a number of causes, and often occur under such circumstances that the real cause is never definitely determined. On account of its comparatively short wheel base and high center of gravity, as well as the movement of water in the cistern, surging back and forth and from side to side, the tender is subjected to forces with which it is particularly difficult to deal and which are aggravated by any irregularity which may exist in the track. Derailments of this kind occur more or less frequently on every large railroad in this country. Such derailments should be given the closest possible study with the view of definitely ascertaining their causes and of eliminating them as far as practicable."

Experimenting With Lunch Counter Cars.

THE Pennsylvania Railroad recently completed a new solid steel lunch counter car, and on December 1st, placed it in service between New York and Philadelphia, on trains which also carry ordinary dining cars. While the novelty of the counter car may for a while prevent a fair comparison in the patronage of the two kinds of cars, it is planned to continue the experiment for a sufficient period to determine just what is more popular with the traveling public. The object in building the counter car was to see if it would permit of serving meals to passengers quicker—and thus serve satisfactorily more patrons—than is possible in a dining car.

The new car is eighty feet long, and the exterior appearance is the same as that of a Pennsylvania all-steel passenger coach. The interior is radically different from the ordinary dining car. Instead of tables there is one long mahogany counter extending over half the length of the car; facing this counter on one side are revolving mahogany chairs, secured to the floor. The counter is long enough for twenty-one people to be seated at one time. Back of the counter against the wall there are twenty cupboards for supplies, in addition to receptacles for crushed ice, drinking water, ice cream, milk and cream. Shelves for linen and silver occupy the space under the counter. Sunk in the counter at the end away from the kitchen is a cigar humidor. At one end of the car there is a wash basin for the use of passengers.

The pantry and kitchen are at one end of the counter. The pantry contains dish racks, cupboard, a sink and a locker. Food will be passed from the kitchen into the pantry through openings which can be closed by sliding doors. As these openings are just above the serving table in the pantry, there is no necessity for waiters to go into the kitchen. The kitchen itself is about eleven feet long; it contains a range, broilers, steam table, ice box, coffee urn, soup receptacle and meat warmer.



THE NEW LUNCH COUNTER CAR OF THE PENNSYLVANIA RAILROAD.

The interior of the car is finished in a mahogany color, the same as the dining cars. It is electrically lighted, and ventilation is aided by an exhaust fan and three large electric fans.

The car has been put in service on a train leaving Philadelphia for New York at twelve o'clock noon, as this train is usually heavily loaded, and a large number of the passengers, as a rule, eat their lunch on the train. The second trip of the car is on the train leaving New York the same afternoon at six o'clock.

Educating Railway Men in England

FROM OUR LONDON CORRESPONDENT.

BRITISH railways continue to pay more and more attention to the technical training of their staffs. Company after company has installed new educational and training departments where the newest ideas in railway management and control can be demonstrated and efficiency made manifest. By the courtesy of Mr. George H. Dennis, of the London, Brighton and South Coast Railway, we are enabled to give some interesting details of a new department so far as that important south of England railway is concerned. On November 3, officials of the company opened at Croydon, in the South of London, a school for instruction in railway outdoor work and signaling.

The necessity for, and possibilities of such a school had for some time been recognized by the Superintendent of the line, Mr. Finlay Scott, and about a year ago, he approached the General Manager, Mr. William Forbes, on the matter. This gentleman at once took a keen interest in it and obtained the sanction of the directors to building and equipping the school, together with the cost of upkeep and a grant for prizes, etc. The work was at once taken in hand by the company's engineer, Mr. Morgan, and an excellent room measuring 52 feet by 28 feet has been built adjoining the district engineer's office at East Croydon.

The equipment of the school has been very complete, comprising a model railway and junction 47 feet long, which includes main and branch lines, refuge siding and a crossover road. This model railway is fully signaled and provided with facing point locks and bars, fouling bars, discs, detectors, etc., practically the same as would be done at any similar junction on the Brighton Railway. The whole of the signals and connections of this model railway are worked from a 24-lever frame, properly interlocked as in the case of an ordinary signal box.

Two model trains are provided to work on this railway, one a passenger and the other a goods, all vehicles and engines being painted to the London, Brighton and South Coast colors and designs.

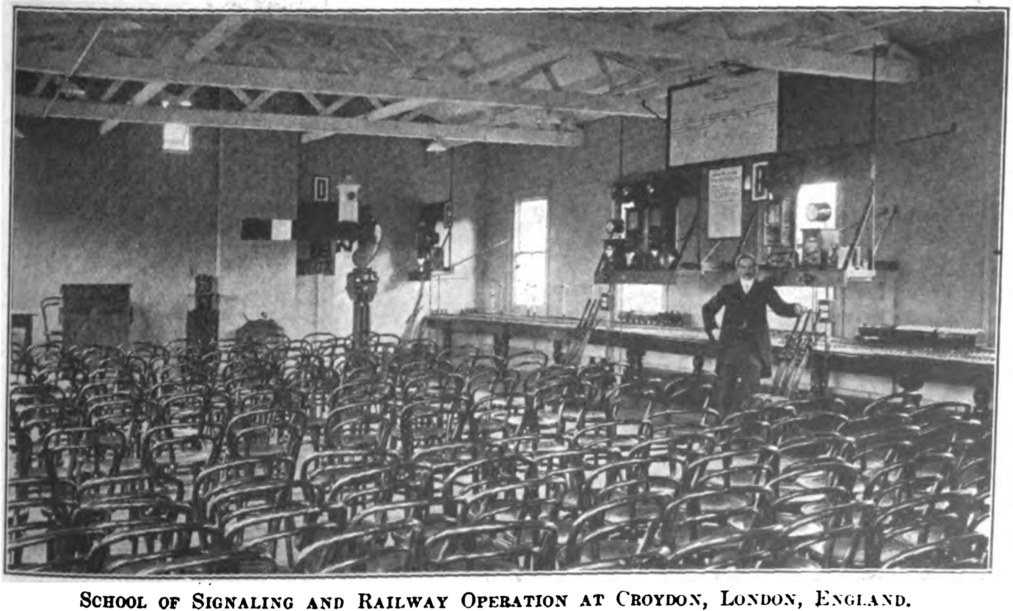
To work with this model there is a complete set of Tyer's Train Signaling instruments, which are mostly in use in the southern district of the line, properly connected as between four boxes, known respectively as A, B, C and D. In addition to this a set of the more up-to-date Sykes Lock and Block Train Signaling instruments are provided and connected as between three boxes, viz.: A, B and C, with eight nearly full size levers to work with them. Two switches, one for Tyer's and the other for Sykes enable the center box B to be switched out.

There are also two single line electric train staff pillars with staffs, electrically connected, also a train staff and ticket box for instruction in the working of single lines.

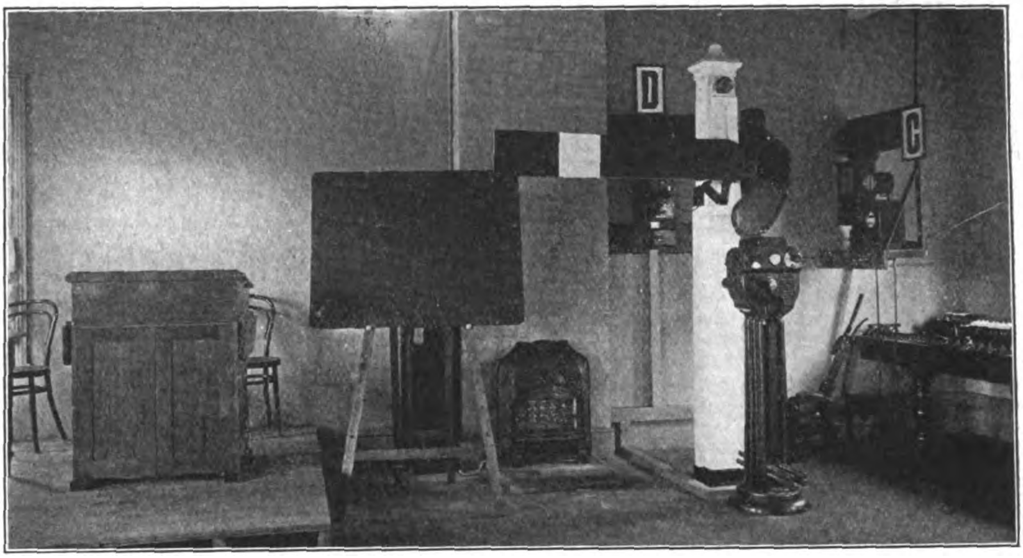
Two pairs of single needle telegraph instruments are fixed, two at either end of the room and connected in pairs, for telegraph practice.

Other equipment of the school consists of a full size home signal post and arm, with lamp, etc., and a signal repeater working with it; also models of a Clayton fog signaling machine and placer. A main lock up switch is provided to enable the current to be cut off from all instruments except the telegraph instruments, thus putting them out of action when not required.

The object of the school is to give everyone who so desires an opportunity of acquiring a knowledge of signaling and outdoor railway working and to avoid the necessity of men going into signal boxes for that purpose, which hitherto has been practically the only means available. The school is open on Monday nights from 8 to 9 o'clock for lectures, and on Friday nights between



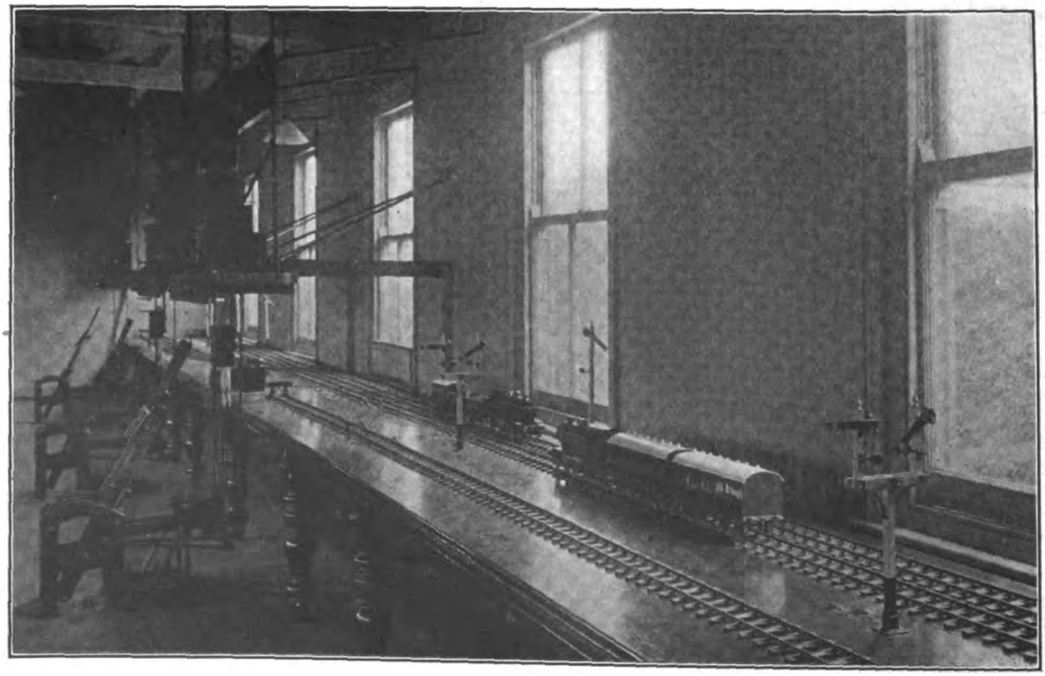
SCHOOL OF SIGNALING AND RAILWAY OPERATION AT CROYDON, LONDON, ENGLAND.



Instructor's Desk and Various Signal Appliances in the Croydon School of Signaling and Railway Operation.

the same hours for telegraph practice. The following are some of the subjects which will be dealt with during the session, which will probably last until April next:

1. The working of fixed signals, facing points, trailing points, catch points, level crossings, gates, etc.
2. Double and single line block working.
3. Sykes' Lock and Block.
4. Working of single lines by train staff and ticket, and by electric train staff.
5. Equipment of trains (head lights, tail lights, guards' equipment, etc.).
6. Working of Westinghouse brake.
7. Slipping regulations.
8. Emergency working of double lines as single lines.
9. Protection of trains, wrong line working, etc.
10. Working during fogs or snowstorms.
11. Working of lines when signals or locking gear are out of order.



The Track and Signal Layout in the Croydon School of Signaling and Railway Operation.

12. Precautions taken by engineer's department when repairing road, etc.

13. Hand signaling.

Mr. W. E. Reynolds, of the superintendent of the line's office, who has dealt with the arrangements and equipment of the school throughout, has been appointed lecturer and will conduct the classes on behalf of the superintendent of the line, under whose supervision the school is placed. Judging by the enthusiasm displayed on the opening night, it is evident that the school is fulfilling a long felt want, and will without doubt do good service.

Safety on the Southern Pacific.

IN competition with all steam railways of the United States the Southern Pacific Company has been awarded the Harriman Memorial Safety Medal founded by Mrs. Mary Averill Harriman, widow of the late railroad builder, for the best record in accident prevention and hygiene affecting the public and its personnel during the current year, 1913. The award was made by the American Museum of Safety, under the auspices of which the competition was conducted.

The record of the Southern Pacific's achievements and efforts involving safety, industrial, hygiene and other correlative conditions during the year was submitted by R. J. Clancy, assistant to the general manager. It showed that during the fiscal year 1913 on the Pacific system of the railroad, 1,373,815,327 passengers were carried a distance of one mile without the loss of a single passenger from train accident, continuing the Pacific System's record for safety in continuity from the year 1908, involving the movement of 8,000,000,000 revenue passengers a distance of one mile without one passenger fatality as a result of train accident.

The report showed the efforts made by the company in connection with its "Safety First" campaign to reduce the hazard of accidents to the public and its employes. These included the investigation into the primary causes of grade crossing accidents; the company's record as a pioneer in the use of steel passenger cars and construction of steel passenger cars; the installation of safety devices in the shops, such as shields for emery wheels and belting; the adoption of pulmotors for use in first aid to the injured; the adoption of pulmotors for use in injured; its hospital service features; the extreme sanitary measures taken in the care of its passenger cars, the icing of water tanks, etc.; the requirement of extreme sanitary measures on the part of its employes; the institution of surprise tests to promote and check efficiency and discipline; the encouragement of safety committees among employes and innumerable other pertinent items to secure the safety of life and limb. The award of the medal names the Southern Pacific the safest railroad on which to travel in the United States and it redounds in two ways to the memory of Mr. Harriman, viz.: the medal as a memorial, in itself, and the award to the railroad of which Mr. Harriman was for so long the head.

Northwestern Dining Car Service Inaugurates New Sanitary Feature.

THE Chicago and Northwestern Railway has established a new policy in its Dining Car Department, which will increase sanitation to the highest possible standard.

The new plan, provides that all dining car conductors, cooks, waiters, private, parlor, buffet and chair car porters as well as all employes of the Commissary Department must undergo a physical examination on or before May 1st and November 1st of each year, to insure their fitness for the class of work assigned to them.

The examinations are conducted by physicians in the employ of the Chicago and Northwestern Railway, who report results direct to the Superintendent of the Dining Car Department.

President Willard's New Year's Greetings to Employes.

IN accordance with his annual custom, President Willard of the Baltimore and Ohio, sent the following telegram early on the morning of January 1st, to all employes of the Baltimore and Ohio Railroad:

"Once more I wish to extend to all employes of the Baltimore and Ohio system my best wishes for a happy and prosperous New Year and at the same time I wish to assure all of my appreciation of their loyal service and support during the year just ended.

"The year of 1913 has been one of unusual difficulties for the Baltimore and Ohio Railroad Company. Never in its entire history has it met with such great disaster as was occasioned by the unprecedented floods of last March. However, except for a few bridges, which have not yet been permanently rebuilt, the damage caused by the high water has all been repaired, but the making of the necessary repairs, together with the loss of business during the interruption, has imposed an excessive and most unusual burden upon the company during the last nine months.

"It is to be regretted that the smaller volume of business to be handled at the present time has made it necessary to reduce the force and curtail expenses as much as possible in all directions. It is hoped that conditions will soon mend to such an extent that the business of this company may again be on the basis of one year ago and the forces be fully restored. While under existing conditions the most rigorous economy is necessary, it should be clearly understood that nothing is to be done which will in the slightest degree adversely affect the safety of operation, and in that connection I wish again to urge the request contained in my message one year ago to-day, that all keep constantly in mind during the year just begun the importance of "safety first." "Safety first" means not only safety for the traveling public and our patrons generally, but also safety for each individual employe. Much has been done in that direction, I am glad to say, during the past year, and I hope we may have the hearty and active co-operation of all during the year just begun."

Daniel Willard.

Mechanical

Wireless Telegraphy in Railway Service.

THE Delaware, Lackawanna and Western Railway has recently been conducting some interesting and successful experiments with wireless telegraphy on moving trains operating between stations 65 miles apart. Heretofore, it has been thought necessary that to successfully employ the wireless system, all receiving and transmitting stations must be equipped with antennae or aerials supported on high towers. This system of course would prove impractical on a moving train, inasmuch as the passing through tunnels and under bridges would not permit the ordinary aerial to be employed. The Lackawanna road, however, has found that wireless communication can be maintained to and from a train in motion, equipped with a low aerial such as the one indicated in the accompanying illustration, which is only eighteen inches above the roof of the car.

The distance between Scranton and Binghamton, the two stations between which these experiments have been carried on, is about 65 miles, and it has been found possible to maintain communication from a train running at a rate of 55 miles an hour with one or the other of these stations. If the train gets too far distant from one station for its abbreviated aerial to send signals through to that station direct, the train is then sufficiently near to the second station to have its signals picked up by it and from there relayed back. In other words, the train is never out of wireless communication with one or the other stations during its 65 mile trip.

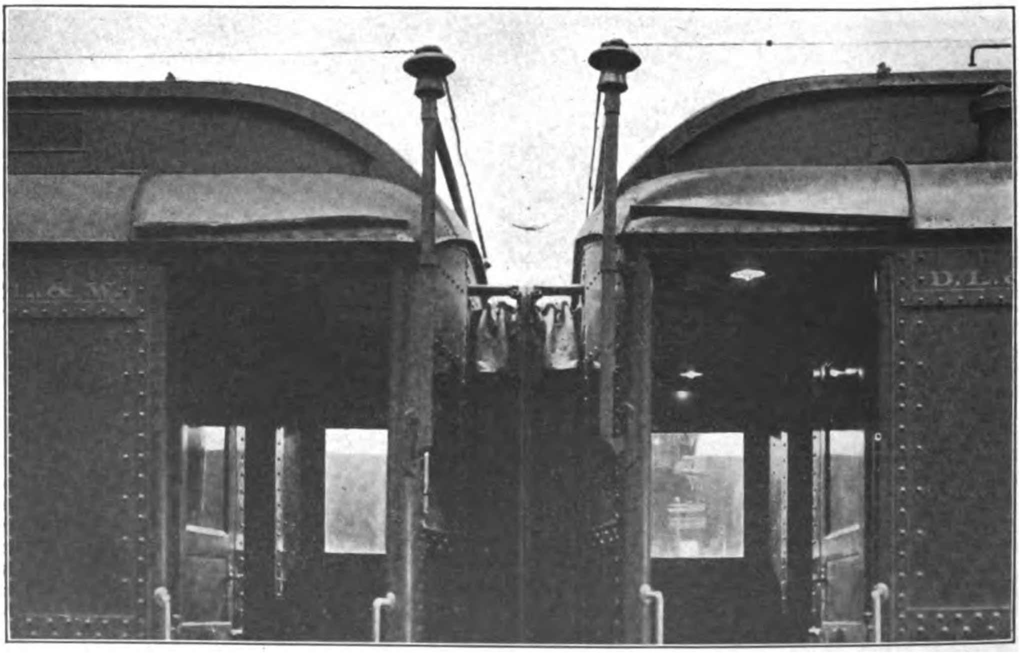
Briefly stated, the train equipment consists of four quadrangular aerials, eighteen inches high, mounted on the roofs of four adjoining cars of the train. A special attaching plug is employed to connect each quadrangle to those on the other cars. The station of the wireless operator is located in a compartment in the third car of the group, thus bringing the lead from his apparatus to the forefold aerial at a point in the middle of the equipment. The power is furnished by a special motor-generator set, driven by the regular train lighting dynamo, and the regular Marconi system is employed. The ground connection is made to the rails by a wire to one of the car trucks. The aerial which is of heavy copper wire, is insulated for high sending voltage by large porcelain insulators mounted on iron posts at the corners of the car.

The conveniences of such a system are of course many and important. It can be employed not only in connection with train operation but also by passengers.

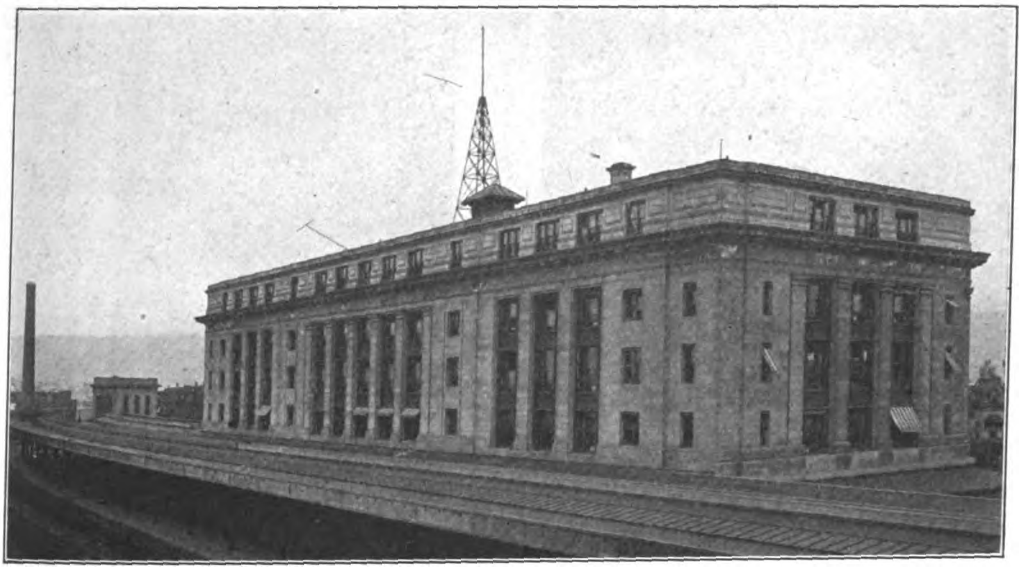
In a recent press interview, Mr. L. B. Foley, the local superintendent of telegraph, had the following to say about the advantages of the new system:

"Signals can be set by wireless as easily and as surely as they are now set by electricity conducted in wires. We have a selective device by which an operator can set a signal at any point if he has occasion to flag a train.

"This means that if any mistakes are made in the orders issued to engineers and conductors at stations or in the case of any emergency in which a train must be stopped to avert an acci-



METHOD OF ATTACHMENT FOR WIRELESS TELEGRAPHY ON EXTERIOR OF PASSENGER CAR EQUIPMENT.



REAR OF THE LACKAWANNA'S SCRANTON PASSENGER STATION WITH WIRELESS ATTACHMENTS.

dent, the station operator can signal the train as certainly as if he had direct wire communication with some one on board.

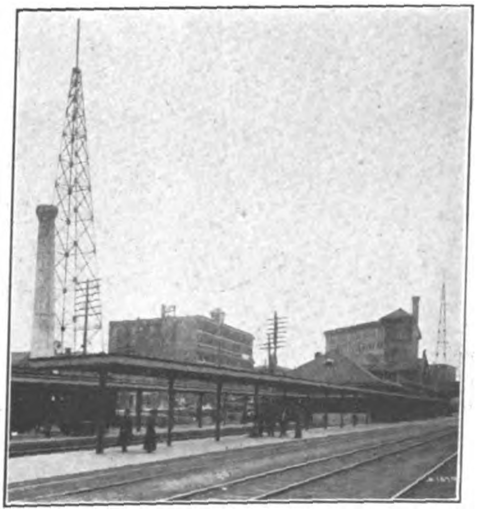
"Another valuable use to which the wireless-controlled signals can be put is the handling of freight trains on long runs. At present a through freight must make many stops between its starting point and destination, so that orders and instructions concerning right of way can be delivered to the conductors, but these frequent stops are a source of expense and delay which will be abolished by the wireless telegraph.

"Keeping freight trains in motion for long distances without stops will result in great economy of operation. Railroad-operating officials know how expensive it is to start and stop heavy freight trains, the additional cost of fuel with the attendant pulling out of drawheads and the wear and tear of equipment being no inconsiderable items in themselves. With direct communication with a train and the ability to set and release signals by wireless, dispatchers can keep in touch with conductors and make the stops needless. The wireless permits the dispatcher to board every train and deliver his instructions as surely as if he handed them to the conductor in a sealed envelope.

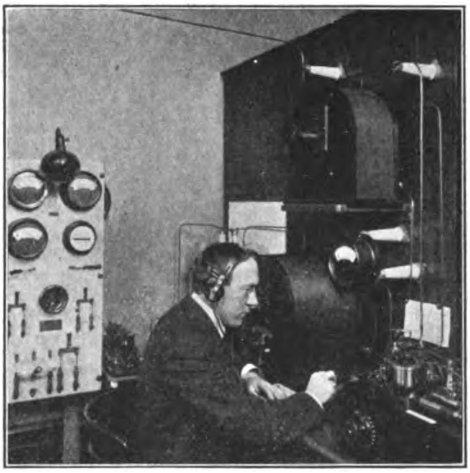
"That the wireless service for ordinary operating purposes is no longer an experiment is proved by the fact that the Lackawanna has already depended upon it when wire communication was cut off. Recently, when a severe sleet storm put all telephone and telegraph lines out of commission in the Mountain Division of the Lackawanna Railroad, all train orders were handled by wireless between Scranton and Binghamton, where the railroad's two fixed stations are. The signals were strong and distinct, and the messages were received and sent by the operators without difficulty. The wireless was the only means of communication between Scranton and Binghamton for two hours, during which fifty-four orders were transmitted."

As soon as all trains are equipped with the wireless the total loss of communication between trains and stations will be a thing of the past, Mr. Foley believes. Such disasters as the Dayton flood and San Francisco earthquake will no longer cause communication between storm-centers and the outside world to be cut off. Messages can be flashed from fixed stations or stalled trains to the nearest station outside the trouble zone. Also derailed or wrecked trains can notify stations of accidents the moment they occur. Commercial telegrams have already been sent from the Lackawanna Limited, and a set of regular toll rates is now being prepared by the railroad and telegraph companies. Moreover:

"The service can be put into operation without increasing the train crews. Regular trainmen can easily learn the telegraph alphabet or telegraph operators on trains can perform the duties



WIRELESS TOWERS AT BINGHAMTON, NEW YORK.



INTERIOR OF LACKAWANNA'S WIRELESS OFFICE AT SCRANTON, PA.

VIEW OF WIRELESS OPERATOR'S COMPARTMENT IN LACKAWANNA'S PASSENGER TRAIN.

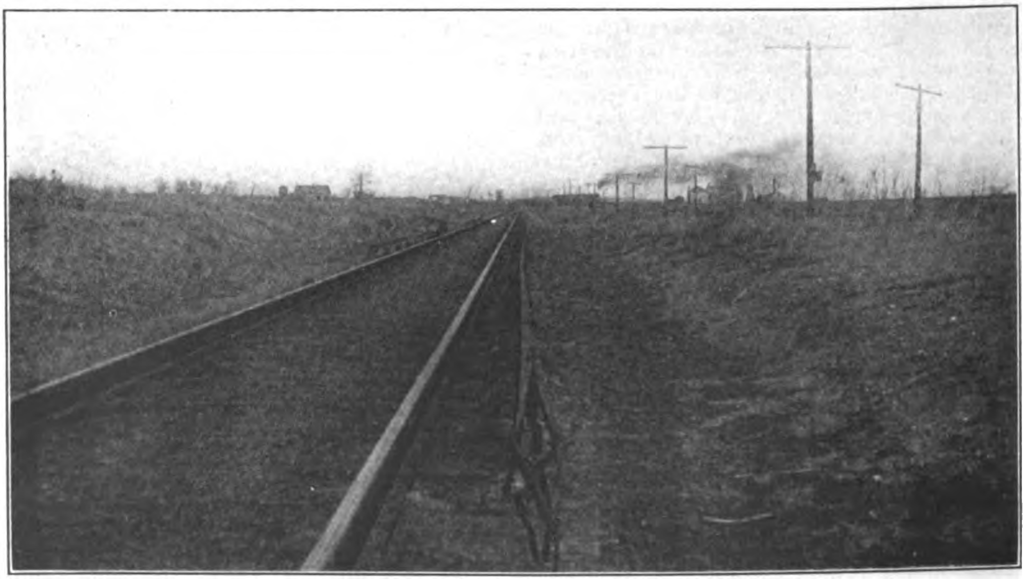
of trainmen. Later, it may be found necessary and profitable to place a telegraph operator on limited trains running long distances without stopping to handle commercial telegrams for the public. Telegraph offices on trains in the future may be of as much value to the public as branch offices in hotels and other places where people congregate in large numbers.

"Railroads can now go ahead and install the service without any fear of failure. There are many fields for the wireless telegraph in railroad operation, in routine business, and emergencies when lives and property can be saved by its use."

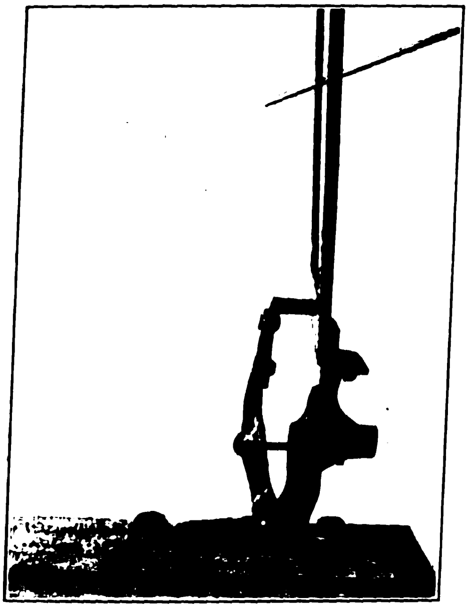
A Timely Automatic Train Stop.

AT the recent International Exhibition of Safety Appliances, held in the Grand Central Palace, New York City, was exhibited a vast collection of devices to protect human life and limb when exposed to danger.

Among the most interesting was the Wooding automatic train control or stop. It is now being displayed for the benefit of the investigating railroad officials at the Permanent Country Life Exhibition, third floor, Grand Central Depot,



THE WOODING AUTOMATIC TRAIN STOP DEVICE, SHOWING THE CONTACT PLATE INSTALLED ALONG THE TRACK.



U Shaped Blade Engaged in Short Section of Contact Blade.

Note the double or knife blade contact and the perfect adaptability of both.

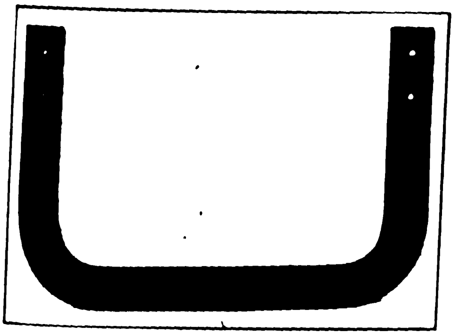
A Short Section of Contact Plate Showing Weather Proof Protection.

They are sixty feet long, bolted to the end of the ties where stop operation is desired.

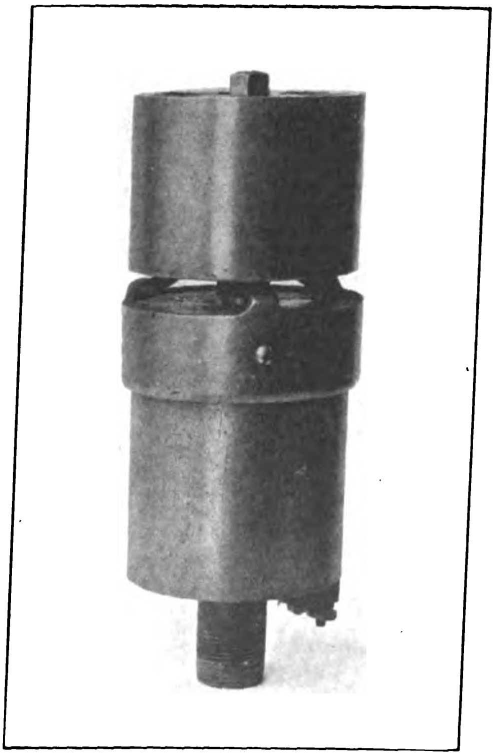
New York City. This device is the invention of Dr. B. F. Wooding, of Denver, Colorado, who has spent fifteen years in perfecting it. As shown by the accompanying illustrations, the parts are few and simple and it operates through the best known physical requirements.

In its operation the track is arranged in blocks with a track battery at one end controlling a track relay at the other, and a line wire running from one relay to the next as under the present system. At the relay is a twelve volt battery as under the present system, connected in such a way that when the relay is closed, as it would be when the block is clear, the return current will pass through the track rail to the far end of the block back.

A specially designed weather-proof contact plate sixty feet long with properly flaring ends, so as to engage the contact blade of a passing train, is bolted to the ends of the ties at a point where it is determined that the engineer should apply his brakes when the next block is occupied by a dangerous condition. This management of the plate makes it a part of the track proper, which is ideal. It is also made a part of the line wire circuit described, so that it cannot be moved without breaking the



The Strong U Shaped Steel Contact Blade Which Has Had Nine Months of the Roughest Use.



The Magnet Controlled Air Valve with Whistle Attached.

It lets go when the current is absent, setting the brakes and blowing the whistle with the released air.

circuit which would stop an approaching train in the preceding safe block.

On the engine or train is the magnet controlled air-valve with whistle attached, a small storage battery and a strong steel blade insulated and hinged to a journal box of the tender. The electrical supply from this battery passes through the blade to insure its perfect condition, and energizes the magnet to hold the air-valve closed while the train is passing from one contact plate to the next. As the train passes, the contact blade enters the contact plate through the flared slotted end and is deflected so as to break the electrical supply on board the train. Then the magnet valve must get its electrical supply from the clear block ahead, as described, or instantly become de-energized and release the strong air pressure, setting the brakes and blowing the whistle. This will be the case should the block ahead be occupied by another train, open switch, a car too near the end of a switch, train on a crossing, broken rail, mud earth slide, etc., or any thing that will cause the relay to fall open and cut off the electrical supply from that block.

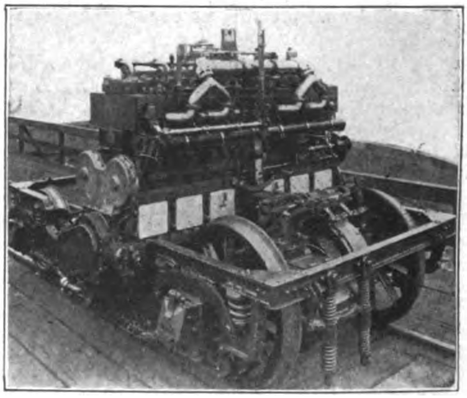
It is claimed that by connecting these track contact plates in the line wire circuit of the present distant signal system and installing the simple equipment on the engines, an automatic train stop would be provided at a minimum expense. Roads that cannot afford to install and maintain the distant signalling system can secure full protection by installing this automatic stop independently with the simple circuits described.

While each part of this device is especially designed for its particular purpose, the feature which places it in a class by itself, is its weather-proof contact. It is only about one-fourth the size of others, gives the greatest clearance, the least physical obstruction, and is exceedingly durable. There is not the slightest appreciable jar when the contact blade engages the contact plate.

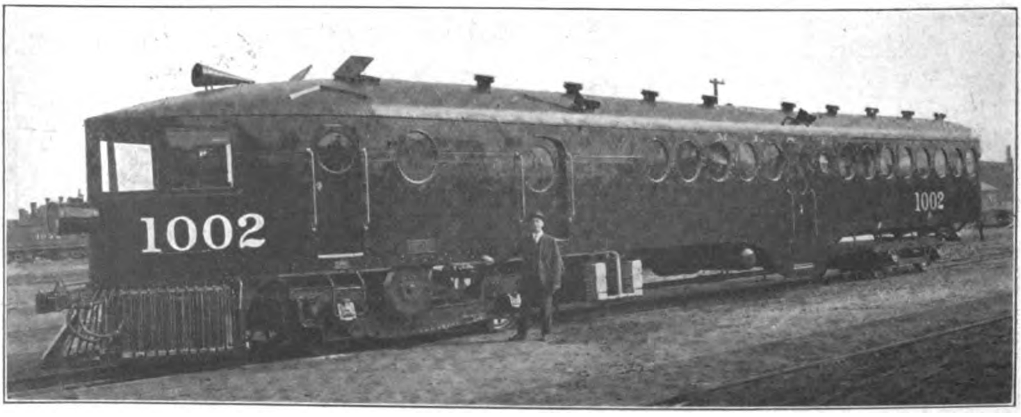
Notwithstanding the many vital functions to be performed by this device it does not make a single mechanical movement. It simply lets go when approaching too near a dangerous condition or on account of defect in itself, by arranging for the absence of the electrical current under such conditions. Hence complications and expense in either installation and maintenance are reduced to a minimum.

Sunset-Central Motor Cars.

NEW Model McKeen gasoline motor cars (Type "C") have been built for and delivered to the M. L. & T., G. H. & S. A. and H. & T. C. Railroads of Louisiana and Texas. One of the new cars and front truck are herewith illustrated, from which it will be noted that the car body is practically identical with the original design of the McKeen Standard car, the tri-unit of operation principle being (1st) VEHICLE, car body, (2nd) PRIME MOVER, internal combustion engine, and (3rd) MECHANICAL TRANSMISSION. With this mechanical transmission of 96 per cent efficiency—a transfer to the driving wheels of 96 out of every 100 horsepower of the crank shaft renders improvement of transmission efficiency improbable. While the latest model motor truck maintains the McKeen standard motor car principles, the new design is the result of nine years' experience in the manufacture of these cars and combines the collective experience of fifty odd



Forward Truck of McKeen Motor Car, Showing Engine.



The Latest Example of the McKeen Motor Car, of Which a Number Were Recently Ordered by the Southern Pacific.

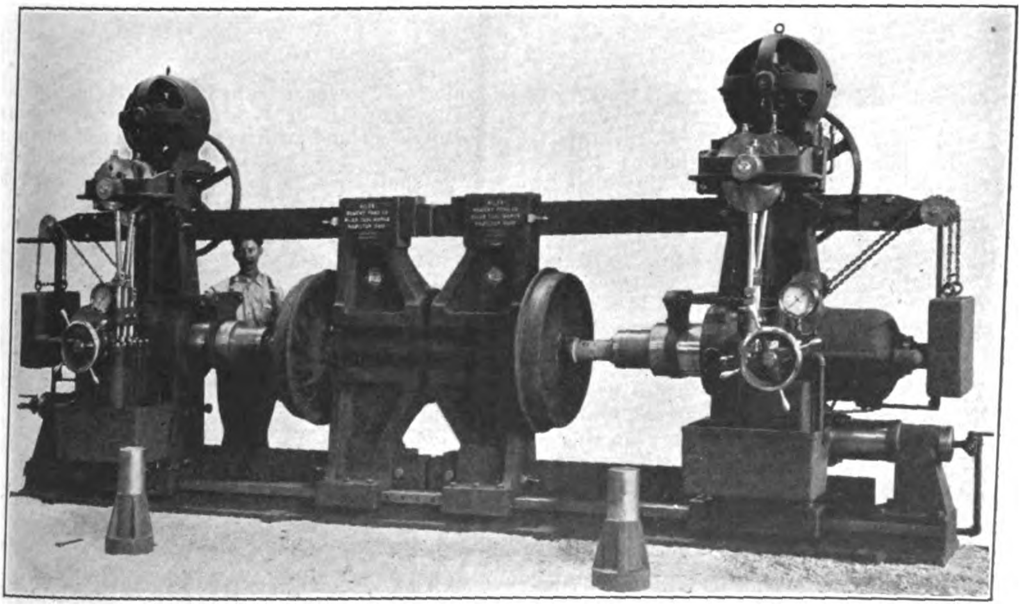
railroads using this equipment. While the new car is of no greater efficiency its up-keep and maintenance charges are materially reduced. A seven year old car recently made the attractive record of covering over 5,000 miles during the month, earning $117 per day at a total operating charge of fourteen cents per mile. It is beyond reason to expect any greater economy or greater efficiency with such earning capacity equipment.

The gasoline engine is really a motor, entirely enclosed and practically fool proof; the machinery is self-lubricated, operates automatically as far as practicable, the idea being to eliminate almost entirely the personal equation of the operator.

General specifications of the Sunset-Central Cars are: Engine, 200 horse power McKeen standard, six cylinder, air starting and reversible. Weight of car in working order, 78,000 lbs. Length between pulling faces of couplers—72 ft. 3¾ ins. Length over end sills—70 ft. Length of engine compartment—13 ft. 8 ins. Length of baggage compartment—8 ft. 6 ins. Length of smoking compartment—16 ft. 4⅛ ins. Length of passenger compartment—28 ft. ⅞ ins. Width inside—9 ft. 4¾ ins. Width over side sills—9 ft. 8 ins. Width over sheathing—9 ft. 8¼ ins. Width over all—10 ft. 2¾ ins. Height, top of rail to top of car, (light) 11 ft. 9 3-16 ins. Height, floor to ceiling at center of car—7 ft. 5⅝ ins. Seating capacity, passenger compartment 54, smoking compartment 29. Total—83.

A Double End Car Wheel Press.

THE car wheel press shown in the accompanying illustration, manufactured by the Niles, Bement, Pond Company, is of the double end variety, and so constructed that two wheels may be removed or two wheels may be pressed on simultaneously. When tended by three men, who handle the wheels, axles, and operate the machine, thirty pairs of wheels can readily be pressed off or twenty pairs pressed on, per hour. The capacity of the press is 500 tons, and it takes wheels up to 42 inches in diameter on the tread. Each head is a self-contained unit, motor driven, and includes pump, tank, pressure gauge and controlling apparatus.



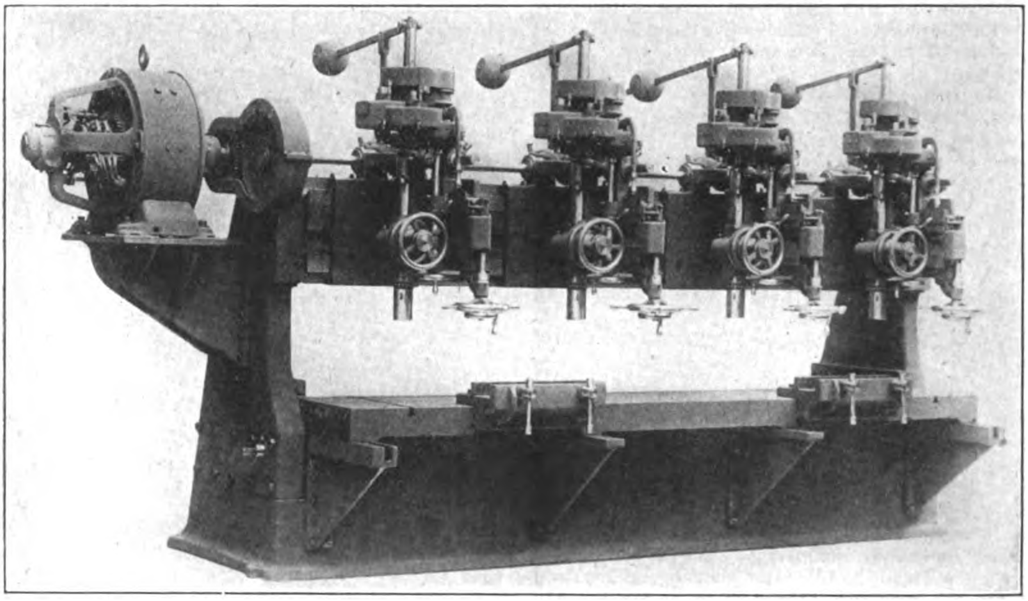
A Double Car Wheel Press Manufactured by the Niles, Bement, Pond Company.

Motor-Driven Mud-Ring and Flue-Sheet Drill.

THE accompanying illustration shows a Foote-Burt four-spindle drill installed in the Juniata shops of the Pennsylvania Railroad, where it is used for drilling the rivet holes around fire box mud-rings and the flue holes in boiler flue sheets.

The heads of this machine have an adjustment in and out from the main cross-rail of twelve inches. They are also adjustable on the main rail up to a minimum center distance of eighteen inches. Both of these adjustments are controlled by individual hand-wheels shown on the front of each slide.

The heads carrying the spindles are complete in themselves as each is arranged with a clutch for stopping and starting. Also each is fitted with geared power feed with adjustable stop for automatically knocking off same at any desired point. Two changes of power feed are provided on each head, either one of which is instantly available by simply shifting a lever conveniently located. In addition to power feed each spindle



A Four Spindle Drill Employed for Drilling Rivet Holes Around Fire Box, Mud Rings and Flue Holes in Boiler Flue Sheets.

is furnished with hand feed through work gearing.

The rail of the machine is very heavy and of box form. The base is of continuous box section and the table is arranged with T-slots and fitted with removable mud-ring chucks. The table has an in and out motion of 36 inches controlled by a lever at either end of the machine.

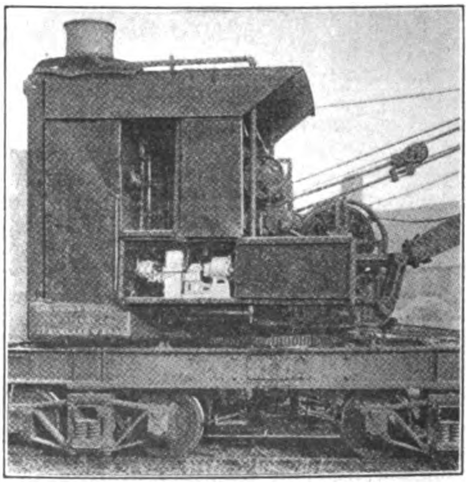
The motor is of Westinghouse make, twenty horse-power and with speed adjustment of from 375 to 1500 r. p. m. It is geared direct to the drive shaft by a large spur gear and a rawhide pinion, both of which are guarded.

The weight of the machine is 23,000 pounds.

Locomotive Crane Equipped with Turbo-Generator Set.

THE Brown Hoisting Machinery Company, of Cleveland, has recently equipped a fifteen-ton capacity locomotive crane with a Terry turbo-generator 5-k.w. set. In this way, the crane can be operated independent of power wires, which it is usually necessary to drag along the tracks where locomotive cranes using electro-magnets are employed. In the case of the crane herewith referred to, the magnet is energized by current from this unit, the location of which is shown in the accompanying illustration. The crane itself, is handled by a reciprocal engine in the usual way and the movement of the boom is taken care of in a similar manner.

Among the special features of this turbo-generator, is an indestructible rotating wheel so rugged as to be unaffected by the large quantities of water due to starting up from cold. Full power, it is asserted, can be obtained in less than a minute and aside from oiling, the turbine receives no attention. As indicated in the photograph, the whole set is a pocket or shelf completely out of the way, and in operation is hidden from sight by the door of the compartment.

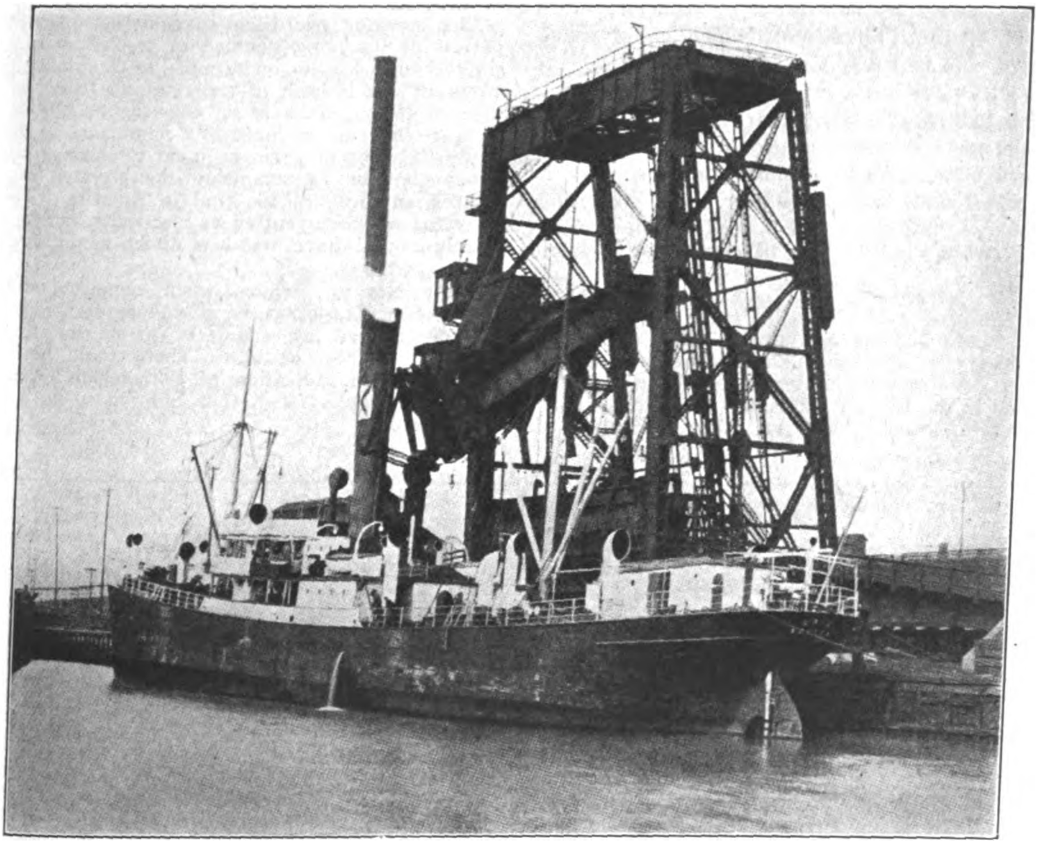


Locomotive Crane Containing Turbo Generator Which Energizes Magnet at End of Crane.

Terminal Improvements

Pennsylvania Railroad's New Coal Elevator.

THE Pennsylvania Railroad has recently installed at Greenwich Pier, Philadelphia, a new coal loading device which assures the quick loading of vessels. The accompanying illustration gives an excellent idea of its general appearance. Cars of fifty tons capacity are raised on an elevator to the mouth of a large chute and the entire car dumped at one time. Thirty cars an hour can be handled in this way, which means that a cargo of 6,000 tons of coal can be loaded in four hours.



NEW COAL LOADING DEVICE OF THE PENNSYLVANIA RAILROAD.

Comfort for the Ladies.

THE Chicago and Northwestern Railway in the building of its new Chicago station, has made a special provision for the comfort of women and children which is being much appreciated and talked about. Six rooms are reserved for their exclusive use, and are furnished with a view to giving every woman stopping in the Terminal personal attention and a maximum of comfort.

Entering the Terminal, they are first met by a uniformed attendant who offers to carry her hand baggage, and escort her to the private elevator which will convey her to the women's apartments. These are located on the second and third floors, removed from all noise and confusion of the city, and include Waiting, Rest, Retiring, Emergency, Tea, Nursery and Hospital rooms.

Experienced and accommodating matrons, nine in number, have been placed on duty in the various rooms, ready to supply such things as patrons may need or request.

In the nursery room, which is a decided innovation, a motherly woman is on duty at all times to relieve mothers of the care of children while they repair to one of the other apartments and enjoy an hour or so of perfect rest. In the nursery room are four cribs for the little ones, while the other part of the room is given up to larger children who may here romp and play to their hearts' content. As many as thirty little ones have been accommodated here at one time.

The waiting room is located on the second floor and is entirely separated from the main waiting room. Comfortable chairs, tables and other furniture to make it cozy have been placed in the room. The other private apartments for women are located on the third floor.

In the women's rest room are easy chairs, tables and attractive stationery for those who would correspond.

In the emergency room, rocking chairs, settees and lounges afford opportunity for a quiet nap if one is indisposed.

The retiring room is a great comfortable place, supplied with rockers, chairs and tables.

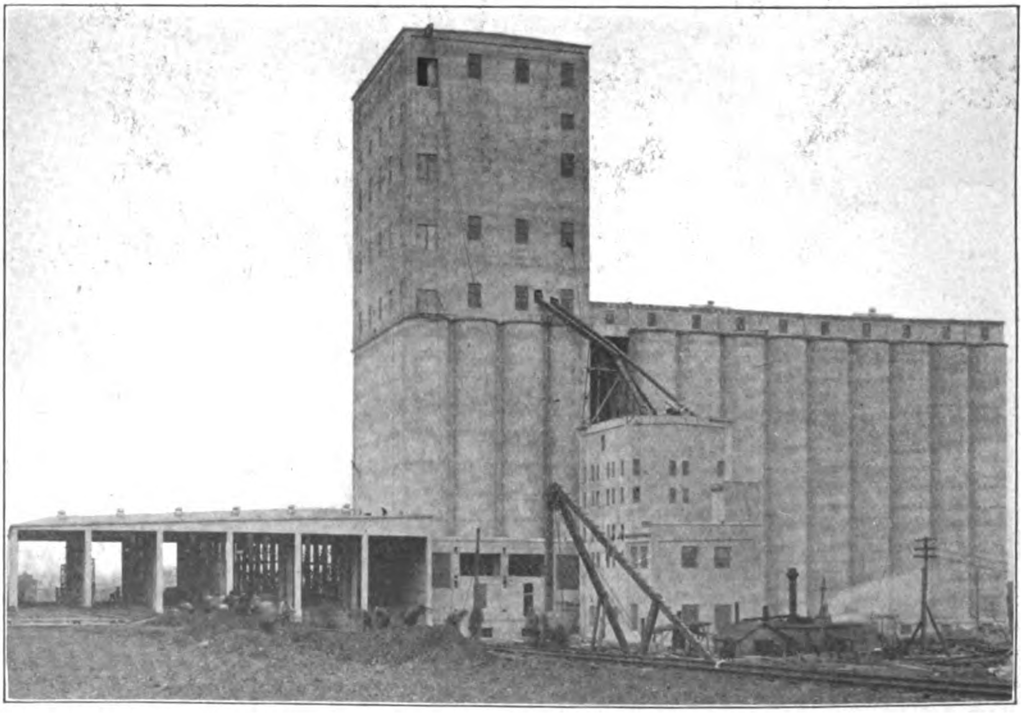
New Philadelphia Grain Elevator.

THE Pennsylvania Railroad has nearly completed its new grain elevator at Girard Point, Philadelphia, which, it is anticipated, will be ready for operation on March 1st. This elevator has a capacity of 1,100,000 bushels with facilities for handling every hour, twenty-four cars of 2,000 bushels capacity each, and for loading grain on steamships or barges, at the rate of 60,000 bushels an hour. Two steamships and two barges may be loaded at one time, or the entire capacity may be concentrated on one vessel.

The conveyor gallery is 1,200 feet long, and is equipped with four belts, each with a capacity of 15,000 bushels an hour. The dock on one side is 900 feet long and on the other side 400 feet. A grain dryer, which is the largest of its kind in the United States, has a capacity of from 3,000 to 8,000 bushels an hour. Four of the latest grain cleaning machines are installed, each of 4,000 to 5,000 bushels capacity an hour.

The elevator has been so constructed as to permit of its being doubled or trebled without interfering with its operation. It is absolutely fireproof. It is built of concrete and reinforced steel, and by reason of its construction, the insurance has been reduced to a minimum. In the rapid handling of grain from car to elevator and from elevator to steamship the elevator surpasses anything of its kind in America. The elevator will be operated by electricity and each machine will have its own direct motor power.

This elevator, which, when completed, will cost about $1,250,000, is of unique design, and is pronounced by engineers to be the most efficient in the world. There could be no more certain indication of Philadelphia's commercial progress than this addition to its port facilities.



NEW PHILADELPHIA ELEVATOR, WITH CAPACITY OF 1,100,000 BUSHELS.

Developments at Spartanburg, S. C.—To provide additional facilities for promptly handling the growing volume of package freight moving through the transfer at Spartanburg Junction, the Southern Railway is making a 275-foot extension to the present covered platform which is 802 feet long and is installing electric lights to serve the entire plant, thus making it possible to work double shifts as well as giving increased floor and track space.

Interstate Commerce Commission

Commission to Examine and Test Safety Appliance Devices.

A CIRCULAR has been issued by the Commission announcing the intention of the Safety Appliance Division to examine and test any safety appliance device offered. The circular said:

"Any person desiring to submit for consideration an appliance or system intended to promote the safety of railway operation should forward complete specifications and detailed prints or drawings, showing fully and clearly the construction, application and method of operation of the appliance or system. The drawings should be made of convenient size for handling and filing, and drawings not larger than nine by fourteen inches in size are preferred. The specifications and plans should be accompanied by a statement showing the following:

1. Name of appliance or system.
2. Name and address of proprietor.
3. Number and date of United States patent or patents.
4. Purpose of the appliance or system.
5. Brief statement of how the purpose is carried out.
6. General description.
7. Statement of relation to other apparatus or operations.
8. Name of railroad or railroads on which used or tried and length of time in use.
9. Name of town, district or railroad division where used or tried.
10. Name of railroad officers of whom inquiry may be made.

"All plans, specifications, drawings and other descriptions which are furnished for examination become a part of the Commission's records and must be retained in its files. When an examination has been completed the papers furnished for such examination will not be returned. For that reason original patents, tracings, or other papers of that nature, which may be of particular value to inventors or proprietors should not be furnished; instead, copies of patents, blue prints, or other descriptive papers of which duplicates can be obtained by the proprietor should be sent. The commission can furnish no protection of the inventor's or proprietor's rights in any device submitted; therefore, plans should not be submitted until the rights of the inventor or proprietor are fully protected by patent or otherwise.

"It is not necessary to submit models of devices. If for any reason it is desired to do so, however, models may be furnished provided the proprietors pay all transportation charges. After examination, models will be returned, if the proprietors so request; but this must also be done at the proprietor's risk and expense. Otherwise models will be destroyed. In every case, however, whether or not models are supplied, complete detailed plans and specifications must be furnished; no report of opinion will be based on examination of a model alone.

"When complete plans of any appliance or system have been furnished they will be placed under examination; after this examination has been completed the person submitting the device will be informed of the results thereof and the conclusions reached.

"Arrangements for tests will not be made until an examination of plans has been completed, and then only when the examination of plans discloses the necessity or desirability of conducting a test under service conditions. In case a test is to be made the apparatus must be furnished, installed and operated without expense to the Commission."

Commissioner Prouty on the Regulation of Securities.

COMMENTING on the bill introduced by Representative Cullop, of Indiana, at the instance of Interstate Commerce Commissioner Prouty for the complete control by the Commission of the issuance of railroad securities and purchase of any interest in other common carriers, Mr. Prouty writes the Boston News Bureau:

"This bill was hastily drawn and is undoubtedly open to criticism at many points.

"My intention was to draft a bill which would, if properly administered, prevent those things which have most brought disaster upon railroad investments, but which at the same time would leave the railroad operator, if he kept within his legitimate sphere, free to finance his property without unnecessary restraint.

"If our railroads are to live permanently under regulation some room must be left for private initiative and private enterprise."

Violations of Service Law.

IN commenting on the Interstate Commerce Commission's recent report of railway violations of the hours of service law for the year ending June 30, 1913, in which nearly 300,000 violations of the sixteen hour limit were reported by 269 railroads during the year, but in which the Commission's analysis points out that while this figure may appear abnormal to the lay mind, it must be remembered that 251,111 men were employed in handling trains during the year and that the excess service probably would not exceed one instance to each employe, Commissioner Charles C. McChord has had the following in part to say:

"Violations of the law limiting service of train employes on American railroads to sixteen consecutive hours go to the very heart of efficiency and train operation.

"The difference in efficiency and safety of operation between various railroad systems, is shown clearly by the Commission's analysis in the marked disparity betwen the ratio of excess service to mileage between railroads serving practically the same territory. For instance, one of the Eastern roads, operating more than 5,300 miles of track, reports 5,224 instances in which train men were on duty for periods longer than those provided by law; while another road in the same territory, with a mileage of less than 3,500 miles, reports 22,663 such instances. A comparison of the figures submitted by two of the principal Eastern lines shows, respectively, a mileage of 2,258, with 5,451 instances of excess service, as compared with 2,389 miles and 16,448 instances. In the prairie country, one road, with a mileage of 4,755, reports approximately 20,000 instances of excess service, while another road in the same territory, with more than 7,500 miles of track, reports only 2,310 instances of excess service.

"In the southwestern territory, one road operating less than 6,400 miles of track reports approximately 1,700 instances of excess service, while another line similarly situated geographically, reports only 280 instances on a mileage of more than 7,504 miles. A corresponding comparison between two roads in the northwestern section of the country shows a mileage of approximately 8,000 miles with less than 800 instances of excess service, while another road with less than 10,000 miles of line reports nearly 6,000 instances of excess service."

The law provides a maximum of sixteen hours as the limit of continuous service for trainmen engaged in the physical operation of trains. This law admittedly is being violated continually by the railroads—many time unavoidably. The carriers are required to report each instance in which an employe served more than sixteen hours consecutively, a fine of $500 being the penalty for failure to report. The analysis shows that derailments afforded the most prolific cause of excess service, 88,317 cases being attributed by the carriers to that generic cause. In 33,360 instances the delays were due to coupler and drawbar defects, while 17,753 cases were attributable to miscellaneous car defects. Land slides, high water, and fire were reported by the carriers involved as responsible for 17,985 cases, and congestion of traffic resulted in 13,812 employes exceeding the limit of service. In 10,620 instances the excess service was caused by track defects and obstructions not resulting in collisions or derailments, while 9,910 cases were due primarily to collisions.

Under the heading of "engine delays," 15,507 instances of excess service were reported as attributable to miscellaneous mechanical defects; while other engine delays usually incident to the operation of trains were responsible for nearly 10,000 additional cases.

"As a result of the prosecutions instituted by the Commission," the analysis points out, "the number of instances of excess service reported during the last six months, as compared with the corresponding figures for preceding years, has shown a marked reduction."

"My belief is," said Commissioner McChord, "that the carriers involved will concede to the Commission's analysis of their reports such a degree of attention as will enable them, by apprising themselves of the preventable causes of excess service, to eliminate the majority of instances in which employes heretofore have been permitted or required to remain on duty for longer periods than sixteen consecutive hours."

TRAFFIC.

Latest Statistics of Foreign Trade.—The Department of Commerce has made public the figures showing the total values of imports into and exports from the United States for the five months, July to November, inclusive, for the years 1911, 1912 and 1913, and also those showing exports of domestic manufactures by great groups for the same period.

Imports for November, 1913, were $148,222,733, as compared with $153,094,898 for November of 1912, a decrease approaching $5,000,000. Imports for the five months of 1913, as shown in the table, were $728,870,201, as compared with $779,325,885 for the corresponding period of the preceding year, a decrease exceeding $50,000,000.

Exports for November, 1913, were $245,550,392, as compared with $278,244,191 in the same month of 1912, a decrease of nearly $33,000,000. Total exports for the five months' period, July to November, inclusive, of 1913, were $1,084,551,655, as compared with $1,049,285,983 for the corresponding period for the preceding year, showing an increase in 1913 in excess of $35,000,000. Comparing the exports with the imports, it shows a trade balance in our favor of $355,681,454 for the five months' period.

Vessel Measurement for the Panama Canal.—President Wilson has issued a proclamation prescribing the "Rules for the Measurement of Vessels for the Panama Canal." The proclamation is brief; the rules and illustrating diagrams cover twenty pages. They are based upon research made by Prof. Emory R. Johnson who has brought under survey all the rules of measurement of all civilized countries and evolved a system peculiar to the Panama Canal and apparently in advance of the measurement system of vessels using the Suez Canal.

As part of the proclamation, a form of tonnage certificate for ships using the Panama Canal is attached. All vessels of commerce, transports, colliers, supply ships and hospital ships, without such authenticated certificates stating the vessel's gross and net tonnage as determined by these rules, will have to submit to measurement before passing through or clearing from the Canal. All war ships, American and foreign, will have to present duly authenticated displacement scale and curves, stating accurately the tonnage of displacement at each possible mean draft.

Taken in connection with the proclamation of President Taft of the 13th of November, 1912, stating that the toll per net vessel ton would be $1.20 the commerce of the world is now in a position to figure cost and advantages of using the canal. The system worked out by Prof. Johnson is eminently fair, the net tonnage being arrived at by a liberal system of deduction for all space that can not be used in a direct earning capacity.

Cars Worth More Than Demurrage.—M. W. Rotchford, manager of the Illinois & Iowa Demurrage Bureau, has issued a strong circular designed to promote car efficiency. Records of 45 principal lines within the territory of the bureau for the first seven months of 1913 shows an increase in cars handled of 12.2 per cent over the corresponding period of 1912, while the increase in cars earning demurrage is 61.15 per cent. The total demurrage earned this year, $273,191, represents an increase of 68.16 per cent. This large increase in demurrage earnings and collections, the circular says, compared with the increase in cars handled "at first sight might be taken by some to indicate a favorable showing, but such is not the case when car efficiency is taken into consideration. The question that naturally arises is—then what does it indicate and what is the remedy? It means: (1) that cars are being delayed in loading and unloading to a greater extent; (2) that 24,673 more cars were withheld from transportation service by some patrons at the same time other patrons were wanting cars; (3) that the railroads' cost of operation was increased by reason of extra switching caused by excessive detention. The remedy is: (1) education of the patron to the fact that the railroad prefers the cars to the demurrage charge; (2) an additional incentive to patron to return cars more promptly to transportation service; (3) increase the demurrage rate to $3 per day, which, according to experience in California lessens car detention.

"There is an erroneous impression abroad that the railroads are satisfied when they collect the demurrage due. While it is incumbent upon the railroads to collect in accordance with their tariff and upon patrons to pay, the railroad loses about $2 per car per day when it collects a dollar demurrage, as the average daily earning is about $3 per car."

A Smaller Classification Committee.—A permanent committee of three to replace the Western Classification Committee of the 52 railroads West of Chicago has been determined on by the Executive Board of the Classification Committee. The three members will hold continuous sessions and this will do away with the delays which resulted when only two meetings a year were held by the whole committee.

ORGANIZATION NOTES.

December Meeting of the Canadian Railway Club.—The Canadian Railway Club at its December meeting, listened to an interesting address by Mr. L. R. Johnson, general superintendent of the Angus shops district, of the Canadian Pacific Railway, on "First Aid to the Injured," as talked and practiced by the St. John Ambulance Association, under the auspices of the Order of St. John of Jerusalem in England.

Meeting of Reading Telegraphers.—To improve working conditions of the telegraph department of the Reading Railway and its allies and leased branches the first annual meeting of the Independent Order of Railway Employes was held in Reading, Pa. Grand President James F. Tatlow, of Philadelphia, presided. President Tatlow explained the aims of the organization, centering particularly on the proper instruction of telegraphers for improvement of their conditions of labor.

"See America First" Movement to be Abandoned.—At a recent meeting of the American Association of General Passenger and Ticket Agents it was decided to abandon the "See America First" movement as a subject for collective action. Its agitation for two years has afforded some benefit to the roads through widespread publicity.

Charles Nagel Addresses Traffic Club of St. Louis.—Charles Nagel, former secretary of the United States Department of Commerce and Labor, in an address before the sixth annual dinner of the Traffic Club of St. Louis in the Mercantile Club urged an intimate co-operation and closer relationship between the United States Department of Justice, Department of Commerce and the Interstate Commerce Commission in order to obtain what he termed a greater commercial development in America.

Mr. Nagel declared no railroad could give satisfactory service unless it had compensating rates. He said it is time for some well-defined and common action to be taken in the matter in reaching a settlement.

Mr. Nagel spoke 45 minutes. He favored a greater development of foreign commerce. He indorsed conservation, but said something should be done in Alaska to allow large development of its lumber and commercial interests. He said that it was better to plant a tree, take it up and use it commercially and industrially than to plant one tree and let it rot for want of use.

Following his address, the meeting adopted a resolution indorsing a proposed five per cent uniform increase in shipping rates by various railroads. A copy of the resolution will be sent the Interstate Commerce Commission in Washington, D. C.

Meeting of Central Passenger Association.—Representatives of railroads affiliated with the Central Passenger Association decided at a meeting held in Chicago, November 12th, to establish a uniform charge of $25 for each one-way movement of special passenger or baggage cars. The charge for this service on a number of roads has been $15 a car.

Annual Meeting of New York Railroad Club.—At the annual meeting of the New York Railroad Club, the following officers were installed for the ensuing year: President, George W. Wildin; vice-presidents, C. W. Huntington, Frederick C. Syze, and Burton P. Flory; treasurer, R. M. Dixon; executive member for three years, Miles Bronson; member of finance committee for three years, Charles Shults.

An interesting feature of the evening was a paper on the "Past, Present and Future of Railway Clubs," presented by Daniel M. Brady. Other speakers were F. W. Brazier, J. Seavers Page, J. B. Anderson, James Powell, of Montreal and F. O. Robinson, of Richmond, Va.

The annual report of the secretary showed a total membership of 2,029 of whom more than 1,000 are in New York and that of the treasurer that the club has a surplus of more than $14,000 in its treasury.

President J. M. Fitzgerald Addresses Toledo Traffic Club.—"Railroads and the High Cost of Living" was the subject of an address by J. M. Fitzgerald, president of the Western Maryland Railway Company, before the Traffic Club, at Toledo, Ohio, November 25th. He said in part:

"Railways cannot continue to provide necessary and efficient transportation facilities on the present rates of compensation allowed for the service of transportation, and which rates are no longer sufficient to carry the high cost of operations due to constantly increasing rates of wages and taxes, full crew bills, safety regulation appliances and other expenditures imposed by Federal and State Legislations and still leave a surplus from operations sufficient to attract new capital.

"The interests of the railways, their security holders, their employes, the shippers, the passengers and the public are identical. By no process of reasoning can you separate them. Therefore, we should all be concerned regarding the conditions now confronting the railways, and which difficulties may be met in one of three ways:

"First—By a reduction in wages, which cannot be considered at this time.

"Second—By reduction in other items of expense, which would of necessity impair the present transportation service and which would, of course, not be tolerated by the public.

"Third—By increased rates."

Election of Officers for Brotherhood of Locomotive Engineers.—The Legislative Committee of the Brotherhood of Locomotive Engineers closed a three days' meeting at Springfield, Ill., on December 6th, with the election as follows: Chairman, J. A. Culp, Blue Island; secretary-treasurer, C. E. Long, Charleston; vice-chairman, C. C. Collier, Mount Carmel; honorary vice-chairman, Lewis McGovern, Freeport. Advisory Board—P. E. Brady, Springfield; Frank Sullivan, Chicago; J. D. Maroney, Salem; Frank Warne, Chicago.

Without a dissenting voice, the committee went on record as opposed to the electrification of all terminals in Chicago as a means of abating the smoke nuisance. One of the arguments advanced was that the danger to life would be greater through the operation of electric engines.

Meeting of American Railway Association.—At a meeting of the American Railway Association held in Chicago, December 3rd, it was decided to submit the question of reclaim charges by switching lines to a vote of all members of the organization. The vote to be taken by letter ballot. The proposition to be voted upon reads as follows:

"The per diem actually paid on each car in switching service may be reclaimed by the switching line from the road for which the switching was performed, subject always to a maximum amount per car, which shall be based upon the number of days required to perform the service. The maximum amount shall be limited to four days on each car, except at certain points, where it shall be limited to six days per car. The roads directly interested in any city of junction have the privilege of determining any less limit satisfactory to them, subject always to the above-named provisions. No reclaim shall be allowed for an intermediate switching movement and no double reclaim shall be allowed."

National Industrial Traffic League Working Against Time Limit Rule.—Officials of the National Industrial Traffic League are planning to hold a series of conferences with representatives of railroads throughout the United States for the purpose of having the present time limit rule for the presentation of loss and damage claims abolished.

In the event of loss or damage incurred in transportation the railroads now require shippers to present claims within four months after delivery or if delivery is not made within four months, after a reasonable time for delivery has elapsed.

It is contended that shippers find it impossible in many instances to present loss and damage claims promptly because consignees fail to inform them that property has been lost or damaged while in transit.

On this account, it is said, shippers have been barred by the four-month rule from collecting claims in thousands of instances. The rule is incorporated in the bill of lading and the National Industrial Traffic League has taken the position that if such a limitation is to be established it should be incorporated into a law.

Railroad officials assert that a time limit should be enforced in order to protect the carriers from fraudulent claims. Officials will agree, at least, to abolish the rule until an opinion concerning its reasonableness is obtained from the Interstate Commerce Commission.

January Meeting of the Baltimore Traffic Club.

THE January meeting of the Baltimore Traffic Club was held on the evening of the second instant. The evening was spent in the enjoyment of a smoker, routine matters only being discussed. One matter of importance disposed of was the selection of January 22d as the definite date for the annual banquet. President Elliott and the Entertainment Committee are planning several interesting features and a thoroughly enjoyable evening is anticipated.

An important change was made in the constitution and by-laws at this meeting, the date for the monthly meetings being changed from the first Friday to the second Tuesday in each month.

A nominating committee of seven members was elected to report a ticket of officers to serve for the year 1914.

The Traffic Club of Baltimore is now just one year old and the year's growth has been very satisfactory, the membership having more than doubled.

January Meeting of Central Railway Club.

THE January meeting of the Central Railway Club was held in Buffalo on the evening of January 9th. Mr. Walter V. Turner, of Pittsburgh, chief engineer of the Westinghouse Air Brake Company, presented a paper on "Air Brakes: Why Their Possible Utility and Performance is Not Obtained in a Higher Degree in Actual Service," and the subject proved to be one of unusual importance and interest to the members. Mr. Turner employed a series of lantern slides which helped him to deal in an interesting manner with the principles underlying brake design and the importance of proper combinations and compromises in all that is involved. His talk covered many conditions of service which required to be discounted in the operation of brakes if desired results and loss are to be avoided and he also discussed at some length the means employed for actuating compressed air brakes which may be either pneumatic or electro and either of these manual or automatic. The aim of the lecture was to impress upon all concerned the importance:

First.—"Of the design of the air brake.

Second.—"The proportion of the design to be maintained in the installation and in service.

Third.—"That these two requirements are vastly more important than what is generally intended by the expression air brake maintenance; that is to say, the cleaning, repairing and various other items involved in attempting to secure proper operation of the brakes.

"The very best brake may be a money losing and trouble creating device in spite of all the maintenance that can be given it if its design and proportions are not maintained in the installation; and closely related to this is the necessity that the limitations of its performance be thoroughly known to those who are using it. The service has become so severe to-day that only the very best brake can produce results at all parallel to those of a few years ago unless much latitude is allowed the engineer both in time and distance with which to control his train."

International Engineering Congress.

IN connection with the Panama-Pacific International Exposition in San Francisco, in 1915, there will be an International Engineering Congress, in which engineers throughout the world, representing all branches of the profession, are invited to participate. A most cordial invitation is extended to engineers to become members of this Congress, and to participate in its deliberations.

The Congress is to be conducted under the auspices of the following five National Engineering Societies, namely: the American Society of Civil Engineers, the American Institute of Mining Engineers, The American Society of Mechanical Engineers, the American Institute of Electrical Engineers, and The Society of Naval Architects and Marine Engineers.

The organization and conduct of the Congress have been placed in the hands of a Committee of Management consisting of the Presidents and Secretaries of these five societies, and of eighteen other members representative of them and resident in or near San Francisco.

The executive offices of the Committee of Management are located in the Foxcroft Building, San Francisco, Cal. The chairman of this committee is W. F. Durand, the secretary-treasurer, W. A. Cattell, and the executive secretary, E. J. Du Puy.

The honorary officers of the Congress will consist of a President and a number of vice-presidents, selected from among the most distinguished engineers of the world.

Colonel George W. Goethals, Chairman and Chief Engineer of the Isthmian Canal Commission, has consented to act as honorary president of the Congress and is expected to preside in person over its general sessions. The names of the vice-presidents will be announced in the near future.

The Congress will hold its sessions during the week, September 20-25, 1915, in San Francisco, in the auditorium and section rooms which will be placed at its disposal by the management of the Panama-Pacific International Exposition Company.

Two distinct, though perhaps equally important, purposes of the Congress should be here emphasized. These are:

First.—The gathering together of a large and representative body of engineers from all civilized countries, with the opportunities which this will present of forming or renewing personal acquaintances, and of interchanging views on the various phases of professional work.

Second.—The reading and discussion of papers before the various sections, and their later publication in such form as to constitute a valuable addition to any engineering library.

In scope and character, it is intended that the Congress shall be truly international, and that it shall embrace, in a thorough and comprehensive manner, the various branches of the engineering profession. Eminent engineers throughout the world will be invited to contribute papers on assigned topics, and in the selection and distribution of these topics the committee will use its best endeavors to render the series of resulting papers widely representative of the world's best engineering practic in the various branches of the profession.

The following is a general indication of the sections and the branches of engineering which each will cover:

Section (1) The Panama Canal.
Section (2) Waterways and Irrigation.
Section (3) Railways
Section (4) Municipal Engineering.
Section (5) Materials of Engineering Construction.
Section (6) Mechanical Engineering.
Section (7) Electrical Engineering.
Section (8) Mining Engineering and Metallurgy.
Section (9) Naval Architecture and Marine Engineering.
Section (10) Military Engineering.
Section (11) Miscellaneous.

The official language of the Congress will be English, and all proceedings and transactions will be published in this language. The papers solicited will be welcomed in any language at the choice of the author; if presented in languages other than English they will be translated, and, together with all papers presented in English, will be printed in this language for presentation at the sessions of the Congress.

A special effort will be made to procure discussions, carefully prepared in advance, for presentation with the papers. In addition, opportunity will be afforded for oral discussions at the various sessions of the Congress. It is anticipated that limitations of space may require the ultimate publication of all discussions in condensed or summary form. Written discussions will be welcomed in any language at the choice of the writer, and if in other than English will be translated for publication. It is expected that oral discussions will be limited to the English language.

The general fee for membership in the Congress will be $5.00 U. S. Gold, which will entitle the member to receive the index volume and any single column of the transactions he may select, together with the right of participation in all the general activities and privileges of the Congress.

At a later time more detailed information will be furnished regarding the papers to be published in each volume of the transactions, together with a form for further subscription to such volumes as the members may desire. The price of these volumes will not exceed $3.50 for each single volume, which will include delivery within the Postal Union, and if the total aggregate of subscriptions shall prove sufficient the price will be reduced accordingly. In any case, a reduction will be made in the price per volume in accordance with the number ordered, and a sliding scale of prices will be determined after a more detailed development of the general plan of publication has been worked out.

Annual Meeting of General Managers' Association of Texas.

At the annual meeting of the General Managers' Association of Texas, held at Dallas on December 4th, the president of the Association, J. H. Hall, dwelt at some length in his report upon the relations between the public and the railways, and what the General Managers' Association of that state had done to cement those of a more friendly character. He spoke in part as follows:

"To my mind the greatest asset the Association has to its credit is the success which has followed its endeavors '*to bring about the better understanding and a more friendly feeling between the railroads and the people.*'

"It has in a dignified and business-like manner, by personal efforts of its members, and through the medium of the press (the latter misunderstood at first by a few, but now understood by nearly all) sought to place before the public such statements and facts—in most every instance based on the reports of the Railroad Commission——as would enable the people to fully inform themselves, and understand the true relation between them and the railroads.

"This policy has been followed for two reasons. The first and main one is that the people pay all the expenses, damages, taxes, etc., pertaining to the operation of the railroads, and are therefore entitled, as a matter of right, to know what these expenses are and how they affect them, in order that they, the people, may, in the exercise of their just and legal rights, have an opportunity to oppose the creation of additional and unnecessary expenses which the public would have to pay. Second, because a very small and insignificant percentage of the people of this country have, in the past, for their own personal gain and advancement sought to engender feelings of prejudice and ill-will toward the railroads by resorting to abuse and misrepresentation. Such misrepresentations, though in many insaances ridiculous, when not denied or refuted, have been accepted by many honest and fair-minded people as true.

"This policy of taking the public into our confidence and treating it as it deserves to be treated has occasioned some expense, but for every dollar so expended, hundreds of dollars have been saved in expenses which would have been saddled upon the people but for such efforts. The people, therefore, have been benefited.

"Hundreds of letters received and the expressions in the editorials of a fearless press are convincing that our present practice of dealing openly and fairly with the people meets with their hearty approval. In fact, but two adverse criticisms appeared in the press throughout the entire state, both of which were promptly and effectively answered. It can be truthfully said that the great and overwhelming majority of the people of Texas desire to be fair to the railroads and will be if honestly informed.

"At the present time it is the policy of the Association to continue to give public expression, when considered necessary, to any and all questions upon which the joint welfare of the people and the railroads depend, inviting honest inquiry and criticism, and at no time to base statements upon statistical figures that cannot be proven by the public records of the Railroad Commission and other public officers of the state.

"That the sentiment of the people of the state toward the railroads has changed decidedly for the better, due in no small degree to the fair and honest expressions of the press and the information given to the people through the channels of publicity referred to above, is patent to all, and a continuance of such policy is to my mind not only proper but desired by the public."

Annual Meeting of the Traffic Club of New York.—The Traffic Club of New York held its annual business meeting and dinner, November 25th, at the Aldine Club. A. F. Mack, freight agent of the United States Steel Products Export Company, the retiring president of the club, told of the large increase in the membership and commented upon the work done during the past year. Mayor-elect J. P. Mitchell was one of a number of new members admitted into the club.

Among the speakers were Burns Durbin Caldwell, president of Wells, Fargo & Co.; R. H. Wallace, general passenger agent of the Erie Railroad; W. J. L. Banham, traffic manager of the Otis Elevator Company; George A. Cullen, of the Delaware, Lackawanna & Western Railroad; Charles A. Swope, of the Louisville & Nashville Railroad; Edward Ritter, president of the Merchants' & Manufacturers' Exchange of New York, and John Pennington, of the New York Central Railroad.

Mr. Wallace, the new president of the club, made an address in which he gave statistics of New York's transportation.

Following are the officers elected for the ensuing year:

President—R. H. Wallace, general passenger agent of the Erie Railroad Co.

Vice-Presidents—W. J. L. Banham, traffic manager of the Otis Elevator Co.; W. W. Hall, general agent of the C. M. & St. P. Railway; J. T. Rogers, traffic manager of the Edison Cos.; W. H. Snell, general agent, passenger department, of the Canadian Pacific Railway, and A. J. Zock, freight agent of the Hamburg-American Line.

Treasurer—Frank C. Earle, 291 Broadway.

Secretary—C. A. Swope, Eastern freight agent of the Louisville & Nashville Railroad Company.

For Board of Governors (three years)—J. L. Carling, traffic manager of Arbuckle Brothers; W. J. Love, assistant to the manager of the International Mercantile Marine Co., and W. H. DeWitt, Jr., Eastern traffic manager of the Western Electric Co.

STATE COMMISSIONS.

Missouri.—Application has been made to the Missouri Public Service Commission by the Chicago, Milwaukee & St. Paul Railroad for permission to issue $470,000,000 in refunding bonds.

The issue is to cover all stock issues, franchises and equipment of the 10,000 miles of the Milwaukee system and will take up its entire indebtedness.

The bonds are to bear interest not to exceed six per cent and will run until the year 2014.

Massachusetts.—An order has been issued by the Public Service Commission refusing to revoke or suspend the previous order calling for interlocking signal apparatus at South Lawrence which the road has now found will cost $153,000.

The Boston & Maine claimed that the recent wreck at this point was not due to defects in the signal system. The Commission says it wants its order filled not only at South Lawrence, but throughout the State, which means, that the railroad must spend $373,873 before July 1, 1914.

New Jersey.—At a hearing before the State Board of Public Utility Commissioners, on an order to compel the Erie Railroad to abolish grade crossings in Paterson, N. J., the company submitted statements showing that the total cost of abolishing all the grade crossings on the Erie Railroad would amount to $134,000,000.

Duane E. Minard, representing the Erie Railroad, showed that in 1913, the Erie Railroad, after deduction of operating expenses and fixed charges had only $5,000,000 left in the treasury out of which to abolish grade crossings, make other improvements and pay dividends, if any. He introduced exhibits covering a ten-year period which showed that in the year ended June 30, 1913, the company earned only 1.13 per cent on its property investment of $453,045,352.

Another statement filed by the Erie shows that the company spent $24,685,361 for equipment, new construction and improvements in 1913 of which $500,000 was for elimination of grade crossings in New York and other large amounts were spent for safety appliances and devices required by law.

New York.—The Baltimore & Ohio Railroad Co. has been authorized by the Public Service Commission to acquire seventeen outstanding shares of the capital stock of the Staten Island Rapid Transit Railway Co.

The Public Service Commission has ordered the Long Island Railroad Company to install forthwith and to maintain and operate an adequate, manually operated, electrically controlled, block-signal system on its Whitestone Branch.

This order is the outcome of an investigation held by the Commission, following a head-on collision on September 22nd, between two trains on the Whitestone Division, about 550 feet east of the College Point Station.

The new system is a signal combination of electrical and manual control, so designed that the tower man can throw the signals open by manual movement, but they are closed automatically either by the operation of another signal or by the passage of a train into the single track stretch. The new signal was approved by the electrical engineer of the Commission.

The Public Service Commission has approved the New York Central's mortgages. The opinion was prepared by Chairman Martin S. Decker. In approving the mortgages, the Commission says that its determination is limited distinctly to such approval, and that such approval does not in any wise commit the Commission to the approval in advance of the consolidation of the Lake Shore, the Pittsburgh and Lake Erie, the Michigan Central or other properties with the New York Central, or to the exchange of the present 3½ per cent collateral bonds for four per cent bonds, except in cases of such consolidation.

The Public Service Commission has issued an order requiring the New York Central & Hudson River Railroad Company to reduce the one-way fares between the Grand Central Station and various points on the Harlem Division from 25 per cent to 33 per cent and on the Hudson River Division about 30 per cent.

The Public Service Commission has ordered the Long Island Railroad Company to discontinue the operation of twenty-four wooden cars on any of its passenger trains made up in part of steel cars, and has forbidden the use of any wooden cars for the transportation of passengers on any electrically driven trains, except when necessary to maintain schedules.

The order also provides that after September 15, 1914, the company shall not operate any wooden cars at all for the transportation of passengers in electrically driven trains.

Pennsylvania.—Figures compiled by the State Public Service Commission, based upon reports from the railroad companies, show that 4,355 steel passenger cars are in service on the 82 railroads of Pennsylvania. There are 11,889 passenger cars of all kinds in service, of which 7,163 are of wood construction, 1,271 wood with steel underframes and the rest all steel. In the list are 1,365 Pullman cars, of which 1,018 are steel, 62 wood with steel under-frames and the rest all wood. The report is the first of its kind compiled by the Commission. There are 128 railroads in the State, but only the 82 carry passengers, the rest being industrial roads. The Pennsylvania system has the largest number of passenger cars of all kinds and the largest number of steel coaches and Pullmans in service on its lines.

The Central Railroad Company of New Jersey has informed the Public Service Commission that it is not violating the full crew law, as charged by President Lee, of the Brotherhood of Railroad Trainmen. Observing the law, the company says, has resulted in added cost of more than $9,000 a month on account of the extra brakemen made necessary.

Texas.—The Railroad Commission has granted the milling-in-transit privilege asked for by large rice milling interests in South Texas.

Upon the advice of Attorney-General Looney that the suit against the Southern Pacific for refusing to apply to Victoria the rates based through Port Lavaca and the water competition could not be successfully prosecuted, Chairman Allison Mayfield, of the Railroad Commission, has notified the Attorney-General's department of the Commission's intention to dismiss the case. The rate from Galveston to Victoria, based on Port Lavaca charges, make a less combination than the standard mileage rates quoted all rail from Galveston to Victoria. There is nothing to prevent shippers from consigning freight to Lavaca on the water combination rate and then reconsigning shipments to Victoria on the usual locals, which would give the low combination.

LEGISLATION.

Probable Trust Legislation.—The scope of President Wilson's program of anti-trust legislation has become fairly well defined and it is understood that the measures to be advanced at these sessions will aim at the following results:

Definition of the various forms of monopoly and restraint of trade which would be "conclusively deemed" unreasonable and in violation of law.

Placing upon the defendant the burden of proof to show that there is no "unreasonable" restraint of trade.

Prohibition of interlocking directorates between large corporations.

Establishment of an Interstate Trade Commission, to exercise regulatory powers, make original investigations and aid the courts in carrying out decrees of dissolution of trusts.

It is stated that one of the chief aims of legislation of this character will be to clear up what is now termed the "twilight zone" of corporative activities.

LABOR.

Railroad Employes Petition Commission for Rate Advance.—Employes of the Baltimore and Ohio Railroad at Newark, Ohio, are circulating a petition to the Interstate Commerce Commission, asking that the application of the eastern railroads for an increase in freight rates be granted. The petition is being circulated in business circles, shippers, merchants, jobbers, buyers, public officials, professional men and others, showing a willingness to sign it. Several hundred names have been affixed to the document.

The petition is being circulated on the initiative of the railroad men themselves and has the endorsement of all classes of employes.

The communication to the Interstate Commerce Commission sets forth that the application of the railroads is believed to be wholly within reason, in view of the concessions made during recent years to employes, the higher cost of material and supplies and other items of expense having to be met. It also points out that both freight and passenger rates have been raised on foreign roads while during the same period in this country many of the rates have been reduced.

"The undersigned urgently solicit your favorable consideration of the request for an increase in freight rates," reads the petition, "in order that railroad facilities may be developed to meet the demands of constantly increasing traffic."

LAND AND INDUSTRIAL.

Frisco Inaugurates Campaign for Better Farm Marketing.—In a circular effective December 1st, Frank Anderson, Director of Development of the Frisco Lines, announces the appointment of E. C. Hoag as Supervisor Farm Marketing, in charge of the marketing branch of the Department of Development. Mr. Hoag was formerly Division Freight Agent of the Frisco Lines at Joplin, Missouri.

W. B. Biddle, Receiver and Chief Traffic Officer of the Frisco had the following to say in connection with the appointment:

"We expect farm marketing to be one of the important features of the work of the Department of Development. We do not expect to revolutionize the present system of marketing in a day, but investigations covering a period of more than a year convince us that a decided improvement can be made in the interest of both producer and buyer.

"A great many markets heretofore unsupplied or insufficiently supplied will consume a great share of the products for which the farmers along our lines have not so far been able to find a market. We have also satisfied ourselves that along our own rails markets for a great share of the products produced by the farmers in our territory can be found.

"There should be a larger interchange of business betwen various sections along our lines. Bringing this about will result in improved markets for our producers.

"Our plans as now being worked out do not contemplate interference with any one. On the other hand we believe the railroad is equipped in such manner as to bring together the parties in interest in such a manner that all will profit.

"The bankers' organizations recently formed along our lines can be an important factor in working out the marketing problem.

"One of the evils which has resulted in great loss to the producers has been improper grading and packing. The Department of Development has given its attention for the greater part of the past year to the formation of such grading and packing organizations as would establish a standard for the various products. This we believe will not only enable the producers to better and more profitably sell their output, but will assure the buyers of a standard that they can rely upon.

"We are inviting the co-operation of both producers and buyers in working out the problem."

CONSTRUCTION.

Railway Construction in Canada.—During the year 1913 the railways of Canada have had in hand, in one State or another, fully 6,000 miles of new construction. By June 30th last, when the year for railway statistics closes, between 1,800 and 2,000 miles had been taken into operation as finally completed, and since that date there has been immense activity. Including lines which have been surveyed, lines for which the contracts have been let, and lines for which the contracts have been completed, the total will run to the extraordinary figure quoted. At present the Canadian Pacific has well over 1,000 miles in hand, the Canadian Northern not far short of 2,000 and the Grand Trunk Pacific about 1,000, while there also is to be considered the 500 miles of the Hudson Bay Railway, and the National Transcontinental, which is now nearing its completion. The present activity in construction work constitutes a record.

BOOK REVIEWS.

Railway Problems. Revised Edition. Edited by William Z. Ripley, Professor of Economics in Harvard University. Published by Ginn and Company. Price, $2.50.—The present revision of "Railway Problems" is made along the same lines that distinguished the original edition. While primarily intended to serve as a text-book for college classes in the economics of transportation, the book aims also to offer, in convenient form for the general reader and student of American public questions, authoritative information upon this important economic and political question.

The book naturally divides itself into four parts:

The FIRST, or historical section, affords a back-ground for comparison and contrast with present conditions.

The SECOND section deals with the traffic problems before the Interstate Commerce Commission, and gives some insight into the origin and development of railway rates and tariffs.

The THIRD section deals specifically with the present problem of governmental regulation in the United States. An expert description of the new Hepburn Act is followed by a discussion of the relation of the Interstate Commerce Commission to the courts.

The FOURTH section presents descriptions by competent authorities of the present status of the railway problem in Great Britain, Germany, and France.

FOREIGN ROADS.

Costa Rican Railroads.—A comprehensive discussion of the railroads of Costa Rica, by M. Desire Pector, French Consul-General in Honduras, appears in the October number of the "Revue Economique Internationale." It seems that Costa Rica was the second Central American country to have a trans-continental railway. The distance by rail across the continent here is 208 miles, part of which is covered by the Ferrocarril el Pacifico (Pacific Railroad) and part by the Ferrocarril de Costa Rica (Costa Rica Railroad). These two roads and the Ferrocarril del Norte (Northern Railroad) constitute the three systems of the country, the total mileage of which amounts to 404 miles. The Pacific Railroad has 68 miles; the Costa Rica Railroad, 206 miles; and the Northern Railroad, 130 miles. The last two systems are under the management of the United Fruit Company, and a considerable part of the traffic consists of bananas.

Traffic returns for two divisions of the Pacific Railroad give an average of 2.89 cents per passenger-mile for 1910 and 3.03 cents per passenger-mile for 1911; while the average for freight receipts in 1910 was 0.836 of one cent per ton-mile.

On the Costa Rica Railroad the first-class passenger fare from Limon to San Jose, a distance of 103 miles, was $3.84; and a second-class ticket cost $3.04. The maximum weight of baggage carried free on one ticket was 44 pounds (20 kilograms).

The line across Costa Rica is about as long as the Tehuantepec route through Mexico, but crosses the mountains at an elevation of over 5,000 feet, whereas the highest elevation on the Tehuantepec route is 883 feet. However, the picturesque mountain scenery in Costa Rica is an attraction for tourist traffic, which in a measure tends to offset the disadvantages due to high grades.

ELECTIONS AND APPOINTMENTS.

Executive.

F. A. Delano, president, Chicago, Indianapolis & Louisville R. R.

L. C. Gilman, president, Hill Lines in the West. Headquarters, Portland, Oregon.

E. A. Goeldner, assistant to vice-president, and general manager, Southern Kansas Railway Co., of Texas and the Pecos & Northern Texas Ry. Headquarters, Amarillo, Texas.

Charles C. Harrison, director, the Reading Company and the Philadelphia and Reading Railway.

W. C. Hurst, vice-president and general manager, Chicago, Peoria and Eastern Railway.

Edward M. Hyzer, vice-president and general counsel, Chicago & Northwestern and the Chicago, St. Paul, Minneapolis and Omaha. Headquarters, Chicago, Ill.

J. R. Kenly, president, Atlantic Coast Line Railroad Company. Headquarters, Remington, N. C.

Oscar Lawler, director, San Pedro, Los Angeles and Salt Lake R. R. Headquarters, Los Angeles, Cal.

James W. Lusk, receiver, St. Louis & San Francisco Ry.

W. F. Owen, president, New Orleans, Mobile and Chicago R. R. Headquarters, Mobile, Ala.

Charles E. Perkins, director, Chicago, Burlington & Quincy R. R.

John H. Peyton, president, Nashville, Chattanooga and St. Louis Ry.

W. A. Rambach, assistant to vice-president, Gould Lines. Headquarters, Chicago, Ill.

J. C. Stewart, assistant to the president, Erie Railroad.

John G. Sutton, vice-president and general manager, Ocean Shore Railroad. Headquarters, San Francisco, Cal.

H. V. P. Taylor, president, St. Louis Association of General Passenger Agents.

G. F. Turley, vice-president and general manager, Virginia-Carolina and the New River, Holsten and Western R. R.

Legal.

John C. Bill, assistant general solicitor, Pere Marquette R. R. Headquarters, Detroit, Mich.

Parker, Shields & Brown, general attorneys, Pere Marquette R. R. Headquarters, Detroit, Mich.

Financial.

J. A. Harvel, secretary, St. Louis Association of General Passenger Agents.

Accounting.

L. A. Lambert, auditor, miscellaneous receipts and accounts, Baltimore and Ohio Railroad. Headquarters, Baltimore, Md.

Horace R. McCormick, auditor of disbursements, Philadelphia and Reading Railway. Headquarters, Philadelphia, Pa.

T. D. Simmons, acting car accountant, Georgia and Florida R. R. Headquarters, Augusta, Ga.

F. C. Uhlman, general auditor, Western Maryland Railway. Headquarters, Baltimore, Md.

Engineering and Mechanical.

Webb C. Ball, general time inspector, New York, New Haven & Hartford and the Central New England. Headquarters, New Haven, Conn.

F. E. Bates, chief draughtsman, bridge department, Missouri Pacific Railway. Headquarters, St. Louis, Mo.

F. T. Beckett, engineer, maintenance of way, Chicago, Rock Island and Pacific Railway. Headquarters, El Reno, Okla.

F. L. Burckhalter, chief engineer, Portland, Eugene & Eastern Ry. Headquarters, Portland, Oregon.

C. F. Burrell, engineer and roadmaster, Kentucky and Indiana Terminal. Headquarters, Louisville, Ky.

A. M. Burt, chief engineer, maintenance of way, Northern Pacific. Headquarters, St. Paul, Minn.

Robert F. Byers, master mechanic, Central Dominicano Railroad. Headquarters, Porto Plata, Dominican Republic.

W. J. Calvin, roadmaster, Northern Pacific Ry. Headquarters, Sedro Wooley, Wash.

H. R. Clark, roadmaster, Chicago, Burlington & Quincy R. R. Headquarters, Burlington, Iowa.

G. C. Cleaver, engineer maintenance of way, Buffalo, Rochester and Pittsburgh Ry. Headquarters, DuBois, Pa.

J. C. Clendenen, road foreman of engines, Norfolk and Western Ry. Headquarters, Portsmouth, Ohio.

R. Collett, superintendent of locomotive performances, St. Thomas & San Francisco Railroad.

John S. Cooper, car foreman, Rock Island Lines. Headquarters, Hulbert, Ark.

J. F. Deimling, assistant chief engineer, Michigan Central. Headquarters, Detroit, Mich.

C. C. Elmes, road foreman of engines, Shamokin Division, Philadelphia and Reading Railway.

G. Clinton Gardner, Jr., assistant engineer of motive power, Northern Division, Pennsylvania Railroad. Headquarters, Buffalo, New York.

F. W. Gilcreast, engineer maintenance of way, Lehigh and New England R. R. Headquarters, South Bethlehem, Pa.

Paul L. Grove, master mechanic, Pennsylvania Railroad. Headquarters, Sunbury, Pa.

E. W. Hammond, division engineer, Buffalo, Rochester and Pittsburgh Railway. Headquarters, DuBois, Pa.

W. C. Hattan, division engineer, Elkhorn extension, Carolina, Clinchfield & Ohio Railway. Headquarters, Dante, Va.

C. C. Hill, engineer of construction, Michigan Central Ry. Headquarters, Detroit, Mich.

E. M. Keough, roadmaster and assistant trainmaster, Streator Branches, Chicago, Burlington & Quincy Ry. Headquarters, Aurora, Ill.

Frank McManamy, chief of division of locomotive boiler inspection of the Interstate Commerce Commission.

T. S. Mahoney, superintendent of terminals, Texas and Pacific Ry. Headquarters, New Orleans, La.

F. B. Marble, division engineer, Michigan Central Railway. Headquarters, Niles, Mich.

Melvin S. Montgomery, road foreman of engines, Northern Pacific Ry. Headquarters, Duluth, Minn.

George Murphy, roadmaster, Savanna Lines, Chicago, Burlington & Quincy Railroad. Headquarters, Rochelle, Ill.

C. A. Paquette, chief engineer, maintenance of way, Cleveland, Cincinnati, Chicago & St. Louis Ry. and the Peoria and Eastern Ry. Headquarters, Cincinnati, Ohio.

R. W. Prichard, assistant superintendent, car department, Terminal Division, Rock Island Lines. Headquarters, Chicago, Ill.

J. P. Reynolds, division engineer, Erie Division, Buffalo, Rochester & Pittsburgh Ry. Headquarters, Rochester, N. Y.

J. W. Sasser, superintendent of motive power, Norfolk Southern R. R. Headquarters, Norfolk, Va.

Philip Stohlberger, road foreman of engines, Atlantic City R. R.

Elliott Sumner, master mechanic, Pennsylvania Railroad. Headquarters, Philadelphia, Pa.

R. C. Violett, roadmaster, Chicago, Burlington & Quincy Ry. Headquarters, Aurora, Ill.

E. B. Weatherby, engineer, maintenance of way, Kansas City Terminal Railway. Headquarters, Kansas City, Mo.

William V. Wicks, road foreman of engines, Northern Pacific Ry. Headquarters, Jamestown, N. Dak.

P. O. Wood, assistant superintendent locomotive performance, St. Louis and San Francisco R. R. Headquarters, Springfield, Ill.

Operation.

E. R. Allen, assistant superintendent of terminals, Erie Railroad. Headquarters, Jersey City, N. J.

J. F. Alsip, trainmaster, Tacoma Division, Northern Pacific. Headquarters, Tacoma, Wash.

W. A. Baldwin, assistant general superintendent, Erie Grand Division, Erie Railroad. Headquarters, New York City.

Charles W. Brown, assistant superintendent, Lehigh and New England R. R. Headquarters, South Bethlehem, Pa.

E. N. Brown, trainmaster, Baltimore and Ohio Southwestern R. R. Headquarters, Chillicothe, Ohio.

B. C. Byers, division superintendent, Cleveland, Cincinnati, Chicago & St. Louis Ry. Headquarters, Mt. Carmel, Ill.

W. J. Calvin, roadmaster, Northern Pacific Railway. Headquarters, Sedro Wooley, Wash.

G. S. Cameron, trainmaster, Baltimore and Ohio Southwestern. Headquarters, Seymour, Ind.

E. E. Carter, assistant superintendent, Kansas Division, St. Louis and San Francisco R. R.

William H. Carter, trainmaster, Cincinnati Division, Cleveland, Cincinnati, Chicago & St. Louis Railway. Headquarters, Springfield, Ohio.

C. O. Claiborne, assistant superintendent, Western Division, St. Louis and San Francisco R. R.

C. M. Clark, assistant superintendent, Eastern Division, St. Louis and San Francisco R. R.

William H. Corbett, trainmaster, Minnesota Division, Minneapolis, St. Paul & Sault Ste. Marie Ry. Headquarters, Harvey, N. D.

T. E. Coyle, superintendent, Pasco Division, Northern Pacific Ry. Headquarters, Pasco, Wash.

Bert Crumler, assistant trainmaster, Norfolk & Western. Headquarters, Williamson, W. Va.

J. J. Cummins, assistant superintendent, Northern Division, St. Louis and San Francisco Railroad.

J. L. DeForce, superintendent, Idaho Division, Northern Pacific Railway. Headquarters, Spokane, Wash.

J. B. Dickson, assistant general manager, Ohio Grand Division, the Erie Railroad. Headquarters, Cleveland, Ohio.

H. O. Dunkle, general manager, Chicago Division, Erie Railroad. Headquarters, Chicago, Ill.

C. P. Eckels, superintendent, Delaware Division, Erie Railroad. Headquarters, Susquehanna, Pa.

E. A. Goeldner, assistant to the general manager, Western Lines, Atchison, Topeka and Santa Fe Railway. Headquarters, Amarillo, Texas.

C. H. Hensley, assistant superintendent, Ozark Division, St. Louis & San Francisco Railroad.

C. A. Irvin, assistant superintendent, Red River Division, St. Louis and San Francisco Railroad.

M. E. Johns, superintendent of terminals, New York, Susquehanna and Western Railroad. Headquarters, Jersey City, N. J.

Charles W. Jones, general manager, First District, Chicago, Rock Island and Pacific Railway. Headquarters, Des Moines, Iowa.

E. M. Kelly, trainmaster, Sandusky Division, Cleveland, Cincinnati, Chicago and St. Louis Ry. Headquarters, Bellefontaine, Ohio.

C. F. Kirchner, assistant superintendent, Southeastern Division, St. Louis & San Francisco Railway. Headquarters, Birmingham, Ala.

W. J. Kleck, trainmaster, Texas and Pacific Ry. Headquarters, New Orleans, La.

F. B. Lincoln, general superintendent, Erie Grand Division, Erie Railroad. Headquarters, New York City.

T. S. Mahoney, superintendent of terminals, Texas and Pacific Ry. Headquarters, New Orleans, La.

C. D. Martin, general manager in charge of Eastern Lines, United States Express Company.

J. J. Mantell, superintendent, Wyoming Division, Erie Railroad. Headquarters, Dunmore, Pa.

M. R. Moran, assistant superintendent, River and Cape Division, St. Louis and San Francisco Railroad.

J. A. Morris, superintendent of terminals, Cleveland, Cincinnati, Chicago & St. Louis. Headquarters, Springfield, Ohio.

R. S. Parsons, general manager, Ohio Division, the Erie Railroad. Headquarters, Cleveland, Ohio.

David F. Peters, trainmaster, Scioto Division, Norfolk and Western Railroad. Headquarters, Portsmouth, Ohio.

P. H. Phinney, assistant superintendent, Central Division, St. Louis and San Francisco Railroad.

Albert J. Stone, general manager, Erie Division, Erie R. R.

B. F. Van Vliet, superintendent, Iowa & Dakota Division, Chicago, Milwaukee & St. Paul Railway. Headquarters, Mason City, Iowa.

H. S. Walker, assistant trainmaster, Norfolk & Western Railway. Headquarters, Eckman, W. Va.

A. G. Whittington, acting general manager, International & Great Northern. Headquarters, San Antonio, Texas.

E. H. Zeigler, superintendent, Peoria and Eastern Division, Cleveland, Cincinnati, Chicago & St. Louis Ry. Headquarters, Indianapolis, Ind.

Traffic.

W. H. Alexander, assistant general freight agent, Missouri Pacific-Iron Mountain Railway.

F. D. Armstrong, commercial agent, St. Louis & San Francisco R. R. and the Chicago and Eastern Illinois R. R. Headquarters, New Orleans, La.

J. W. Allen, general agent, freight department, Missouri, Kansas and Texas Ry. Headquarters, St. Louis, Mo.

F. C. Baird, freight traffic manager, Bessemer and Lake Erie R. R. Headquarters, Pittsburgh, Pa.

H. L. Baird, assistant general freight agent, Bessemer and Lake Erie R. R. Headquarters, Pittsburgh, Pa.

J. L. Baker, soliciting freight agent, Southern Railway. Headquarters, Jacksonville, Fla.

E. W. Batchelder, general agent, Erie Railroad. Headquarters, Jamestown, N. Y.

Elias Bernstein, night ticket agent, Baltimore and Ohio R. R. Headquarters, New York City.

J. E. Boggs, city passenger and ticket agent, Chicago Great Western R. R. Headquarters, St. Paul, Minn.

C. P. Bowsher, commercial agent, Missouri, Kansas and Texas Ry. Headquarters, Louisville, Ky.

W. G. Brooks, soliciting freight agent, Georgia Southern & Florida. Headquarters, Jacksonville, Fla.

H. S. Brown, soliciting freight agent, Baltimore and Ohio R. R.

C. L. Bullard, commercial agent, Delaware, Lackawanna and Western R. R. Headquarters, Utica, N. Y.

W. S. Burton, chief clerk, general freight agent, Western Maryland Railroad.

Harry C. Bush, member, Western Classification Committee. Headquarters, Chicago, Illinois.

W. E. Chambers, assistant general freight agent, Louisville, Henderson and St. Louis Ry. Headquarters, Louisville, Ky.

J. T. Conley, general freight agent, the St. Paul System. Headquarters, Chicago, Ill.

U. G. Couffer, freight claim agent, Pittsburgh, Cincinnati, Chicago, & St. Louis. Headquarters, Pittsburgh, Pa.

W. S. Crowl, general agent, Michigan Central R. R. Headquarters, Detroit, Mich.

M. P. Davis, traveling freight agent, Louisville & Nashville. Headquarters, Jacksonville, Fla.

UNITED STATES RUBBER COMPANY.

1790 Broadway, New York, January 2nd, 1914.
The Board of Directors of the United States Rubber Company has this day declared from its net profits a quarterly dividend of Two per cent (2%) on the First Preferred Stock, a quarterly dividend of One and one half per cent (1½%) on the Second Preferred Stock, and a quarterly dividend of One and one-half per cent (1½%) on the Common Stock of the Company, to Stockholders of record at 3 P. M., on Thursday, January 15th, 1914, payable, without closing of the transfer books, January 31st, 1914.
W. G. PARSONS, Treasurer.

NEW TRAFFIC BOOKS

Practical Readable **THE BIG 4** Up-to-date Convenient

Four new texts on Traffic have just been published. They have four qualities that should make them sought for by all traffic men—*They are practical and up-to-date. They are convenient and readable.* The books are: 1.—**Freight Classification,** by E. R. Dewsnup, Professor of Railway Administration, University of Illinois; 2.—**Freight Claims,** by W. A. Trimpe, a Chicago Lawyer, experienced in this line; 3.—**Routing Freight Shipments,** by J. F. Morton, Traffic Manager of the Chicago Association of Commerce; 4.—**Reducing Freight Charges to a Minimum,** by J. F. Strombeck, President of the Strombeck-Becker Mfg. Co.

These books form in part the basis of our **course of instruction by correspondence in Interstate Commerce and Railway Traffic.**

Write to-day for free illustrated book and full information, Department 544.

Headquarters for Railway Men

Railway World

VOL. LVIII. FEBRUARY, 1914 No. 2

General Business Endorses the Proposed Increase in Freight Rates

THE RAILWAY WORLD has concluded an investigation, the results of which conclusively show an overwhelming sentiment among business men in favor of permitting the carriers in Official Classification territory to increase their freight rates five per cent. So important and significant have been the results obtained that the entire issue has been devoted to their presentation.

To procure this information, letters were addressed to the Mayors of cities of over 5,000 population in the territory involved, as well as to the secretaries of the more important commercial organizations *and it was definitely stated that all replies received, either of a favorable or unfavorable character, would be given the same impartial treatment and publicity.* The Mayors were requested to state their opinion as to the attitude of the business men of their community towards the rate increase, and the secretaries of the commercial organizations were asked to submit any resolutions passed in relation thereto, or, if no resolutions had been passed, to indicate if possible, the general sentiment of their members. Three hundred and eighty-five replies were received from both sources, covering, to a greater or less extent, the following states:

New York.
Pennsylvania.
Illinois.
Ohio.
Massachusetts.
Michigan.
Indiana.
New Jersey.
Wisconsin.
Maryland.
West Virginia.
Connecticut.
Maine.
Rhode Island.
New Hampshire.
Vermont.
District of Columbia.
Delaware.

In addition to the replies from the Mayors and Secretaries, six Governors of States answered the RAILWAY WORLD's communication. Governors Pothier of Rhode Island, Baldwin of Connecticut and Hatfield of West Virginia, reported the majority sentiment of the business men of their States to be in favor of the increase, while Governors Haines of Maine, Miller of Delaware and Ferris of Michigan, declined to answer the questions submitted on the basis of lack of sufficient information upon which to determine accurately what the prevailing sentiment of their States might be.

The following statement indicates the character of the replies received:

States. From Whom Received.	Favorable.	Unfavorable.	Uncertain.
New York—			
Mayors	11	4	4
Commercial Organizations	14	2	12
Pennsylvania—			
Mayors	24	13	3
Commercial Organizations	20	2	20
Illinois—			
Mayors	8	4	2
Commercial Organizations	18	1	18
Ohio—			
Mayors	6	5	2
Commercial Organizations	13	0	12
Massachusetts—			
Mayors	5	2	0
Commercial Organizations	8	1	12
Michigan—			
Mayors	11	4	4
Commercial Organizations	6	0	7
Indiana—			
Mayors	3	5	3
Commercial Organizations	7	2	12
New Jersey—			
Mayors	3	1	0
Commercial Organizations	3	0	9
Wisconsin—			
Mayors	1	0	2
Commercial Organizations	7	0	7
Maryland			
Mayors	1	0	0
Commercial Organizations	3	0	0
West Virginia—			
Mayors	5	0	1
Commercial Organizations	7	0	0
Connecticut—			
Mayors	4	2	0
Commercial Organizations	4	0	5
Maine—			
Mayors	1	0	0
Commercial Organizations	2	2	5
Rhode Island—			
Mayors	0	0	0
Commercial Organizations	2	0	3
New Hampshire—			
Mayors	5	0	0
Commercial Organizations	6	0	2
Vermont—			
Mayors	1	0	0
Commercial Organizations	2	0	2
District of Columbia—			
Commercial Organizations	1	1	0
Delaware—			
Commercial Organizations	0	0	1
Totals—			
Mayors	89	40	21
Commercial Organizations	123	11	127
Grand Totals	212	51	148

This statement, favorable as is its surface appearance, does not indicate the strength of the endorsement for the reason that those advocating the increase presented strong and conclusive arguments in favor of their attitude and represent, to a large extent, the more important communities, while those taking a negative position, belong more largely to the smaller communities, and, as a rule, were satisfied in voicing their opposition by simply answering the questions in the negative without attempting to present reasons in support of their opposition.

The difference in the importance of these replies is more clearly indicated by stating that of those received from the Mayors either for or against the increase, but sixty-nine per cent, were in favor of the increase, while should the population of the cities involved be taken into consideration the proportion in favor of the advance would be increased to eighty-three per cent. Of the replies from trade organizations either for or against the increase, over eighty-three per cent endorsed it, while of the combined replies of both the Mayors and the trade organizations, nearly seventy-nine per cent expressed themselves as favorable to it. Of the total number of replies received from all sources approximately forty per cent were uncertain or reported a divided opinion as to the attitude of the business men of their communities or of their trade bodies.

The following statement shows the population by states, which, according to the replies of Mayors was reported as either favorable or unfavorable to the increase or as uncertain. These figures, taken in connection with the number of replies received, indicate that in the more important communities, where the question has been most thoroughly ventilated and discussed, business men are admitting the justice of the carriers' contentions and desire to assist them out of their present predicament:

	Favorable.	Unfavorable.	Uncertain.
New York	270,338	132,685	85,054
Pennsylvania	1,881,066	256,883	92,948
Illinois	121,527	41,944	3,008
Ohio	168,279	85,295	560,663
Massachusetts	738,055	63,371	
Indiana	57,430	83,253	27,445
New Jersey	24,460		
Wisconsin	40,384	18,310	373,857
Maryland	21,839		
West Virginia	68,773		1,260
Connecticut	45,698	11,866	
Rhode Island	18,390		
New Hampshire	42,055		25,027
Vermont	20,486		10,132
	3,518,780	693,607	1,179,394

Another significant feature of the replies rests in an indication of a growing appreciation of the fact that without railway prosperity, general business prosperity is an impossibility. It would appear, that in dealing with the rate question, the average business man is beginning to understand that his individual welfare is dependent, to no small extent, upon a fair treatment of the railways, which in the present instance, he considers should include an advance of five per cent in freight rates.

The replies also indicate a strong sentiment in favor of granting the increases promptly. While many recognize the desirability of Governmental regulation of railway securities, it appears to be the prevailing opinion that such consideration should not be permitted to interfere with promptly granting the required relief. In other words, the average business man favors settling the case on the basis of the present financial requirements of the carriers, in order that they may continue to conduct an efficient and progressive plant; and they express a decidedly definite opinion that a decision involving this immediate necessity should not be interfered with by extraneous conditions, regarding which either Congress or the Interstate Commerce Commission is at liberty to take action at such time and in such manner, as may be considered best for the public interest.

This attitude is both fair and logical and is, of course, one which necessarily governs business affairs generally. It does not differ essentially from that of most railway officials. They also appreciate that Governmental regulation of future railway issues is a development demanded by the general public. They assert, however, and with reason, that the consideration of this question should not be permitted to delay the financial relief of which they stand so sorely in need; and in this attitude, according to the replies received, they are generally supported.

In presenting the following statements received from Mayors of cities and from secretaries of commercial organizations in Official Classification territory, an effort has been made to faithfully reproduce the sentiment contained in each communication. While, in every case, it has not been possible to present an exact quotation, owing either to the length of the letter or the irrelevance of its contents, a consistent effort has been made to give both sides of the question in the identical manner indicated by the replies. The following questions, the replies to which are indicated by the numerals (1) and (2) are the ones which the Mayors were requested to answer:

(1) In your opinion, is the sentiment of the business men of your city, expressed through the daily press by the resolutions of trade bodies or otherwise, in favor of granting the carriers in Official Classification Territory, the increase of five per cent in their freight rates?

(2) If favorable to the increase, does the public sentiment of your community desire it to be promptly granted, leaving for future consideration such individual rate adjustment as may be made necessary by the increase, and also leaving for future consideration, as Congress may see fit to deal with it, the question of National regulation of railway securities?

The question put to the commercial organizations was as follows:

Has your Association passed resolutions endorsing the proposed advances in freight rates, and if not, what is the attitude of your members towards such proposed increases?

Besides the answers to these three questions, an effort has also been made to present editorials or extracts therefrom bearing on the rate question, which have been published in the daily press in various cities in Official Classification territory during the past few months. In this manner, it has been possible to present a more complete report of the public sentiment of the various communities in the territory involved. Taken as a whole, the following statements constitute an unusually comprehensive and unbiased expression of public opinion regarding the rate question in its application to the proposed increases in Eastern territory:

NEW YORK.

REPLIES OF A FAVORABLE CHARACTER.

Mayor Joseph W. Stevens, of Albany. (Population 100,253.)

(1) The Albany Chamber of Commerce at their annual meeting, have adopted a resolution requesting the Interstate Commerce Commission to grant the application of the railroads for a five per cent increase in freight rates. It is my belief that this sentiment truly represents the sense of the business men of the community. I concur in the recommendation.

Secretary, Albany Chamber of Commerce.

The following resolutions regarding the proposed increase of five per cent in freight rates in Official Classification territory, were passed on December 8, 1913, by the Albany Chamber of Commerce:

Whereas, Financial statistics show that the savings banks of six States in the East have 6,636,343 depositors and that twenty per cent of their deposits are invested in securities of railroads and

Whereas, Albany has seven savings banks with 115,675 depositors and $88,420,704.75 total assets, a large part of which is invested in railroad securities and

Whereas, The increasing commerce of our country is constantly demanding more railroad equipment and larger terminals for its rapid movement, and

Whereas, In the present unsatisfactory totals of railroad net earnings, they are unable to borrow money for urgent improvements at a moderate rate of interest, now

Therefore, We, the Albany Chamber of Commerce, most respectfully request the Interstate Commerce Commission to grant the application of the railroads for a five per cent increase in freight rates.

Mayor of Auburn. (Population 34,668.)

(1) Yes.

(2) Yes.

Secretary, C. G. Adams, Auburn Business Men's Association.

The following resolution was adopted at a meeting of the Board of Directors of the Business Men's Association of Auburn, held on January 20, 1914:

Whereas, An application is now pending before the Interstate Commerce Commission in behalf of the Eastern railroads for an increase of five per cent in freight rates, and

Whereas, While the gross revenue of said railroads has generally increased, the net revenue has decreased owing to the raise in wages and the growing cost of the material, and

Whereas, The railroads have suffered and are suffering from inability to obtain funds for the proper development of facilities to handle increased business, said inability to obtain funds being caused by the continued decrease in net revenue,

Now, Therefore, Be it Resolved, That the Auburn Business Men's Association approves the granting of said moderate increase in freight rates in itself fair and equitable, and that they believe that the increased prosperity of the railroads will stimulate and help business in general.

Secretary, Geo. C. Lehman, Buffalo Chamber of Commerce. (Population 423,715.)

The following is a copy of the resolutions adopted by the Buffalo Chamber of Commerce in reference to the proposed increase in freight rates in Official Classification territory:

Whereas, Carriers in Official Classification Territory have filed petition with the Interstate Commerce Commission for rehearing in Docket No. 3400, in the matter of advance in rates, asking for general increase of five per cent in all freight rates, praying that the case may be re-opened and further considered, owing to increased cost of operations of various kinds set out in their petition, the net return no longer being sufficient; and the Commission being of the opinion, from a consideration of the allegations of that petition, the need of, and justification for the additional revenue should be further examined by it at the present time, and

Whereas, The Commission thinks that such examination can be made more satisfactorily and more comprehensively in a general proceeding of investigation, instituted by the Commission upon its own motion, than by a further consideration of this particular record, and further have denied the petition for a rehearing, and

Whereas, The Buffalo Chamber of Commerce has given considerable thought to this subject respecting their attitude in the matter, which they recognize as of great importance to the members of the Buffalo Chamber of Commerce, the carriers as well as the public at large, now, therefore be it

Resolved, That the Buffalo Chamber of Commerce is in cordial sympathy with the purpose of granting railroads such rates as will permit them to properly operate and maintain their properties, and pay a reasonable return on the money invested, and is in sympathy with the Interstate Commerce Commission in making a thorough investigation of the need of, and justification for additional revenue, that body to determine from the facts the necessity for said proposed advance, and the reasonableness of the rates to be established thereby, consideration being given to certain localities where the rates are now excessive and unreasonable.

Buffalo Corn Exchange. (Population 423,715.)

The Transportation Committee of the Corn Exchange and the elevator owners at Buffalo, have sent a joint letter to the Interstate Commerce Commission stating that their committees are in sympathy for the purpose of granting such rates as will permit the railroads to operate and maintain their properties so that adequate service be given to the shipping world and at the same time a reasonable return be allowed upon the money invested. Objection, however, is made to any increase in the rail and lake rates, as it is claimed by these interests that traffic moving under these rates has already contributed its full measure to any reasonable advance.

William B. Curtis, Secretary, Dunkirk Board of Trade. (Population 17,221.)

No formal resolution has been passed by our organization nor has the matter been submitted to them, but an informal canvass convinces us that the opinion of our members is practically unanimous in favor of the request for an increase of five per cent.

Mayor W. Irving Greffing of Glens Falls. (Population 15,243.)

(1) Yes.

(2) Yes.

Mayor of Hornell. (Population 13,617.)

(1) It seems to be the sentiment among the fair minded that an increase ought to be permitted in freight rates commensurate with the railroads' increased expenses and our Chamber of Commerce has written Congressmen that it favors a reasonable increase.

(2) Yes.

Secretary, Hornell Chamber of Commerce.

The following resolutions which express the attitude of the Hornell Chamber of Commerce regarding the proposed increase in freight rates of five per cent in Official Classification territory, were adopted on December 22, 1913:

Resolved, That the Hornell Chamber of Commerce records itself as in favor of the application of the railroads for a reasonable increase of freight rates; that in our opinion such increase is necessary on account of business conditions and increased cost of operation, and that it is advisable because it will result in better railroad accommodations, more railroad construction and safer transportation; and that the secretary be directed to communicate this Resolution to our Congressman and to E. E. Clark, Chairman, Interstate Commerce Commission.

Mayor Louis Van Horsen of Hudson. (Population 11,417.)

(1) Yes.

(2) Yes. I believe that ninety per cent of the intelligent class of our people feel that the constant agitation against railroads is being carried too far and that government ownership is a dangerous undertaking.

Secretary, A. J. Bootey, Manufacturers' Association of Jamestown. (Population 31,297.)

The postal card vote on the increase of freight rates asked by the railroads now being conducted, has resulted so far in 38 replies being received in favor of the increase, and only five against it.

Mayor Frank J. Nelson, of Lackawanna. (Population 14,549.)

(1) Yes.

(2) Yes, decidedly, as it affects business in our city.

Secretary, Frank S. Gardner, New York Board of Trade and Transportation. (Population 4,766,883.)

The following report of the Executive Committee of the New York Board of Trade and Transportation adopted on November 12, 1913, expresses the attitude of that organization towards the proposed increase in freight rates:

Your Committee is impressed with the great importance of a proper decision of the matter at issue in the above proceedings not only to the railroads whose rates and charges are to be affected, but also to all the business interests of the country.

Business men are naturally adverse to any increase of the charges they shall be obliged to pay for any service they receive. But they are interested in and favor the adoption of all measures which are necessary to insure the efficiency of service and safety upon railroads. If an increase of freight rates can be shown to be necessary to these ends we believe that all fair-minded business men will cheerfully accede to any advance which the Interstate Commerce Commission may determine to be required.

For thirty years or more National and State legislation, local ordinances, taxation, and advances in wages have been adding progressively to the costs which the railroads are compelled to bear. All of these exactions are ostensibly imposed in the public interest. Some are doubtless unreasonable and unnecessary, but they all tend to increase cost of service. They have been compensated for to some extent if not wholly, by improvements in cars and various devices and by improvements in management.

Every advance in the cost of production or of service, whether to a manufacturer, a merchant or a railroad must be met by some compensating reduction elsewhere or the balance will go on the wrong side and decay begin.

A limit is fixed beyond which governmental exactions imposed upon railroads may not go—they shall not be confiscatory. But there is a point short of confiscation where burdens, although legally imposed upon railroads, begin to work decay and ruin.

Capital is attracted to a railroad by the same inducement only which attracts it to a manufacturing or a commercial business—by the promise of an adequate revenue. The denial of adequate revenue discourages investments. Inadequate capital leads to decadence in a railroad, to inefficiency and calamity.

Rates should be high enough to provide for maintenance and operation, and for a reasonable return or revenue upon necessary capital invested.

We disagree, however, with the proposition that rates charged should provide railroads with capital to make such extensions as should be the functions of new investments. Presumably, when the demand for new capital arises it is a result of an enlarged traffic. If by efficient management the larger traffic can be handled without proportionate increase of capital it is manifest that the profits realized will be greater in proportion to the investment, and this greater profit, of itself, should be an adequate inducement to sufficient new capital to enable the railroad to handle the greater traffic without an increase in freight rates.

We believe that the validity of the demand for a five per cent increase in freight rates should be tested by this principle alone, but in expressing this opinion we do not prejudge adversely the case in question. We believe that railroads should be liberally dealt with because upon their efficiency and ability to meet the demands of constantly growing business depend the development and progress of the country. The proposition for a five per cent increase of freight rates should be the subject of a most thorough and searching investigation. Nothing short of clear and convincing evidence will properly answer the demands of the railroads if the increase should be denied, or will satisfy the public if it be acceded to.

We, therefore, recommend that the whole subject be referred to the Committee on Railway Transportation of this Board with the request that it take it under careful consideration, and the Committee be empowered to make such representations to the Interstate Commerce Commission as to it shall seem proper after ascertaining the further views of the members of this Board.

All of the papers, communications, schedules and orders connected with the foregoing are attached to this report.

Respectfully submitted,
JAMES TALCOTT,
FRANK BRAINARD,
S. V. V. HUNTINGTON,
WILLIAM H. GIBSON,
STEPHEN FARRELLY,
EDWARD F. COLE,
WILLIAM McCARROLL,
LEWIS NIXON,
For the Executive Committee.

The foregoing report was unanimously adopted at the monthly meeting of the New York Board of Trade and Transportation, held November 12, 1913.

Attest: FRANK S. GARDNER,
Secretary.

Manhattan Club, New York City.

The following resolutions were adopted at a meeting of the members of the Manhattan Club of New York City, held on February 5, 1914. It is of interest to note that the names which were signed to these resolutions but which we are unable to present owing to lack of space, are stated as representing business concerns who annually pay $1,500,000 in freight bills to the carriers.

To the Interstate Commerce Commission—
Washington, D. C.

Whereas, The value of the nation's farm products during the year 1913 reached unparalleled totals and the export trade of the United States in those staples touched figures never before attained, and further the balance of trade in favor of this country is a large one, we are nevertheless at the present time facing an unusual condition, where in accordance with the statement of the Department of Commerce and Labor recently issued, the percentage of unemployed labor is greater than it has been in seventeen years, and business in general throughout the United States is in a depressed condition, and

Whereas, Money is abundant for manufacturing and commercial purposes, nevertheless manufacturing industries are lagging, brought about largely by lack of confidence and belief that the railroad systems of the United States are not in a position of keeping up their properties to the highest state of efficiency, and

Whereas, Furthermore, The parties hereto affixing their signatures, in meeting held at the Manhattan Club, New York City, on Thursday, February 5, 1914, represent purely and only manufacturing and commercial interests that pay freight to the railroads for carrying of their merchandise, nevertheless said parties affixing their signatures hereto are heartily in favor for themselves and for the respective firms and corporations which they represent, of paying and acquiesce in the advance asked for by the Eastern railroads, and feel particularly that until such time as a decision is rendered by the Interstate Commerce Commission that business will continue in a depressed state and therefore be it

Resolved, That the parties affixing their signatures hereto acquiesce in the advance in rates if found necessary by the Interstate Commerce Commission in order to provide business with efficient service, restore general confidence throughout the country, decrease the percentage of the unemployed, and further be it

Resolved, That those parties affixing their signatures hereto urge particularly upon the members of the Interstate Commerce Commission to decide with the least possible delay the vital question before them, so that if they see fit to grant the increase asked for, general business may speedily have the stimulating influence of vigorous railway purchases and thereby stimulate all lines of manufacturing and commercial business.

New York Hide and Leather Association.

On January 13th, the Hide and Leather Association of New York adopted resolutions favoring the five per cent increase in freight rates in order that "business may speedily have the stimulating influence of vigorous railway purchases and that the percentage of unemployed may be quickly thereby decreased.

In presenting the resolution, J. Stevens Ulman of the F. Blumenthal Company said:

> The rate increase asked for is such a small one comparatively, and the consequent increased charge incumbent upon each shipper is such a small increased expense in the conduct of his business, that so far as I can see, it would be many times overcome by the ability of manufacturers and merchants to conduct a normal, instead of what threatens to be a constantly decreasing, business.

Mayor Silas W. Berry of Norwick. (Population 7,422.)

(1) After consulting with the business men and the Board of Trade, it is my opinion that there is no objection to the five per cent increase as outlined in your letter.

(2) As far as I can learn, this proposition would be perfectly satisfactory.

Mayor of Oneonta. (Population 9,491.)

(1) The consensus of opinion of the business men of this city, including those who would have to pay the advance rates, is in favor of granting the five per cent increase for which the roads have petitioned. It is thought such increase would do more than any other one thing to restore the prosperity of the country.

(2) Such increase should be granted forthwith and, as a separate proposition, measures should be speedily adopted to regulate the issuing of railway securities.

Thos. Nelson, Jr., President, Village of Peekskill. (Population 15,245.)

(1) Yes.

(2) Yes.

Mayor D. W. Wilbur of Poughkeepsie. (Population 27,936.)

(1) From my conversation with business men in this city and elsewhere, I gather that the feeling is quite general that the railroads are entitled to consideration in this regard, provided, the roads can show that the increase is necessary to meet running expenses, fixed charges and such betterments as might reasonably be provided for out of net earnings. I also find some business men expressing the belief that some portion of the increase if granted, might be used for the payment of dividends on fictitious stock values. In the long run, I think this problem will work itself out along lines of fair basis to both the railroads and the public. For if Congress gives to the Interstate Commerce Commission the right to fix and reduce rates, the railroads have the right to insist on these rates being fixed at such a point as to enable them to pay a sufficient interest on both capital and bonded indebtedness. Otherwise, the day will surely come when it will be impossible for the railroads to procure necessary capital with which to make the betterments constantly insisted upon by the traveling public.

(2) As to the question of National regulation of railroad securities, I think the sentiment is entirely unanimous among business men that this is the proper thing to do.

Secretary, Howard E. Taylor, Chamber of Commerce Poughkeepsie. (Population 27,936.)

The opinion of business men in this city is that some relief must be extended in the matter and that the public has no right to accept good service unless sufficient charges are allowed to permit good maintenance and pay a reasonable return on the dividend.

Secretary, Roland B. Woodward, Rochester Chamber of Commerce. (Population 218,149.)

The Chamber of Commerce has not taken official action on the proposed increase in railway freight rates. Little or no opposition has been voiced and without doubt, many of our members are not unfavorable to the proposed advance; but the general feeling here has been one of inability to reach a conclusion owing to the intricacies of the subject, but friendly and sympathetic towards the railroads.

Mayor H. C. Midlam of Rome. (Population 20,497.)

(1) The opinion of the business men in this community with reference to the contemplated increase in freight rates, is best expressed by a resolution adopted on July 15, 1913, which requests the Interstate Commerce Commission to grant to the railroads as promptly as circumstances will permit, permission to advance freight rates in the uniform manner set forth in their petition, upon presentation of such figures as will prove the necessity of such increase.

Secretary, Joseph F. Leopold, Asst. Secy., Syracuse Chamber of Commerce. (Population 137,249.)

While no resolutions have been passed by our Board on the subject of an increase in freight rates, it is the consensus of opinion here that they should be increased.

REPLIES OF AN UNFAVORABLE CHARACTER.

Secretary, Gowanda Board of Trade.

This Board has taken no action in reference to the increase in freight rates, but, personally, I assume that the members would be opposed to any increase owing to the fact that the majority of them are manufacturers and as a general proposition, heavy shippers.

Mayor Samuel A. Carlson of Jamestown. (Population 31,297.)

(1) No.

Mayor of Johnstown. (Population 10,447.)

(1) No, whether this increase is an economic justice or not, the general sentiment here is opposed to it.

Mayor of Plattsburgh. (Population 11,138.)

(1) The Common Council of this city says, No.

Secretary, I. W. Cleveland, Sag Harbor Board of Trade. (Population 3,408.)

This matter has never been called to our attention. I think the freight rates are high enough now.

Mayor of Yonkers. (Population 79,803.)

(1) No.

REPLIES INDICATING UNCERTAINTY OR DIVIDED OPINION.

Secretary, William Nelson, Binghamton Chamber of Commerce. (Population 48,443.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

John E. Cooney, Secretary, Cohoes Business Men's Association. (Population 24,709.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, C. H. Jones, Cortland Chamber of Commerce. (Population 11,504.)

No action has been taken by this Chamber of Commerce for or against the increase of five per cent in freight rates in Official Classification territory.

Secretary, J. E. Bally, Elmira Chamber of Commerce. (Population 37,176.)

No action has been taken by the Chamber of Commerce for or against the increase of five per cent in freight rates in Official Classification territory.

Secretary, S. Henry, Johnstown Board of Trade. (Population 10,447.)

No action has been taken by this Board of Trade for or against the increase of five per cent in freight rates in Official Classification territory.

Edward S. Griffing, Mayor, New Rochelle. (Population 28,867.)

(1) Request referred to the Merchants' Exchange for attention.

Secretary, New York City Mercantile Exchange. (Population 4,766,883.)

No action has been taken by this Exchange for or against the increase of five per cent in freight rates in Official Classification territory.

Superintendent, Wm. V. King, New York City Cotton Exchange.

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

John A. Rafer, Mayor, North Tonawanda. (Population 11,955.)

(1) I am not able to give you much information on the above subject not having given the matter attention. Without specific information I am of the opinion that the shippers would oppose any increase in freight rates.

Secretary, Lachlon Macleay, Oswego Chamber of Commerce. (Population 23,368.)

No action has been taken by this Association for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Frank Libolt, Mayor, Port Jarvis. (Population 9,564.)

(1) I have heard the matter discussed but little and am not in a position to make a statement as to what the sentiment is in this city.

Secretary, Salamanca Business Men's Association. (Population 5,792.)

No resolutions have been passed by the

Business Men's Association for or against the five per cent increase in freight rates in Official Classification territory.

Secretary, Savona Board of Trade.

No action has been taken by this Board of Trade for or against the five per cent increase in freight rates in Official Classification territory.

Secretary, Horace W. Raymond, Board of Trade, Schenectady. (Population 72,826.)

No action has been taken by this Board of Trade for or against the five per cent increase in freight rates in Official Classification territory.

NEW YORK EDITORIAL COMMENT.

Albany (N. Y.) Evening Journal, May, 1913.

Short term notes have had to be put out at high rates of interest. Higher rates of interest have had to be allowed on new bond issues, and, then, besides, the bonds have had to be sold at a discount that adds much to the burden of financial obligation. Inevitably, unless relief is granted them, the railroads will soon be unable to negotiate additional loans on any terms, since capital will shrink from investment where not only the return upon it, but even security, becomes more and more uncertain.

Albany (N. Y.) Journal, November 25, 1913.

Opposing the application for increased rates are shippers, whose attitude is illogical, unfair and shortsighted. Knowing that the expenses of the railroads have greatly increased, they still insist that they shall not receive more for the service they give. If their opposition should be successful, they could not expect to have the same adequate and efficient shipping facilities at their disposal.

And what would they say if a government agency should be asked to prevent them from so adjusting prices to cost of production of the things which they ship, as to leave them a fair margin of profit? Wouldn't they protest indignantly against such injustice?

The shippers who stand against the railroads before the Commission in this matter cannot justify their position, and can explain it only on the ground that they want for themselves advantages to which they are not entitled, regardless of the certainty that acceptance of their contention would demoralize and paralyze the railroad business in this country.

Auburn (N. Y.) Journal, January 21, 1914.

The indorsement by Auburn business men of the plea of the railroads for permission to advance freight rates five per cent is the logical sequence of sentiment vouchsafed at the recent banquet.

In indorsing the plea of the railroads, the Auburn business men are assuming a position pre-eminently unselfish. With the remaining business men of the country, they will be the ones to be taxed, in the first instance, for extra freight rates. The part each will bear will be infinitesimal, as has been already pointed out. But this does not alter the fact that the business men, recognizing the justice of a case, are willing to concede a living wage to the railroads of the country.

Buffalo (N. Y.) Commercial, July, 1913.

"There should be little trouble experienced in convincing the Commission that there are good and legitimate reasons for presenting the request, in view of the heavy burdens which have been placed upon the roads by recent legislation and the demands for increased wages which they have granted. Added to these features of the case is the large amount of money which will be required to place road equipment in shape to meet the constantly increasing requirements of the freight carrying business.

"There is a strong public sentiment that the roads are fully justified in their contention that an increase in rates is not only just to shippers, but absolutely necessary if the ability of the roads to handle the rapidly increasing volume of business is to be maintained."

Buffalo (N. Y.) Commercial, November 24, 1913.

There are strong arguments to be presented by the roads in favor of their contention, and it is believed that the result of the hearing will be at least a partial concession on the part of the Commission. There can be no disputing the fact that the expenses of the roads have increased greatly as a result of legislative action during the past few years. Certainly, the matter should be thoroughly probed.

The increase asked for is a moderate one and might well be accepted by shippers, who must see that their own prosperity is bound up in the prosperity of the transportation lines of this country.

Buffalo (N. Y.) Courier, January 5, 1914.

In practically all parts of the United States the best business opinion holds that the country is at the threshold of a period of general prosperity. The remaining thing needful, indispensable, for good times, is that the railroads may prosper, for in very great number the people have investments in the transportation properties and these constitute a factor of immeasurable importance in the national business life.

There is nothing intricate or complicated in the affair of the application of the railroads to the Interstate Commerce Commission for permission to make a slight advance of freight rates. The case is simple enough for anybody to understand. The railroads must subsist on what is paid them by their patrons. The cost of everything has advanced in recent years, the public demand for efficiency is imperative. Every road must be kept up to an increasingly exacting standard in its construction and equipment. The cost of operation has been largely increased by the steady rise of salaries and wages. Such a continual growth of expense cannot in reason endure without wiping out profits and diverting investments from railroad securities if any corresponding increase of revenue is arbitrarily forbidden. The transportation requirements of the country grow apace. The gross receipts of the railroads last year perhaps increased, but the net receipts were reduced, notwithstanding the practice of rigid economies. The roads cannot retrench further with safety of operation and efficiency of service. The five per cent increase appears alike to be necessary for their well being and for public welfare. Dispassionate examination of the situation compels belief that the Interstate Commission should grant the relief sought, as quickly as may be.

Buffalo (N. Y.) Courier, January 27, 1914.

This is a matter with close and active relationship to the business welfare of the country. That other business interests cannot healthily and permanently prosper unless the railroads have some share of prosperity is made obvious by the magnitude of the investment in the nation's rail transportation system. The managers claim the railroads cannot thrive unless allowed to increase revenue to correspond in some degree with increased cost of maintenance and operation.

The justice of the proposed increase is conceded by many shippers. Others, with narrower view and concerned first and last for the individual profit, will oppose any increase of rates on freight of the classes in which they deal.

Buffalo (N. Y.) Enquirer, November 25, 1913.

The railroads' cost of living has vastly increased. Earnings have not increased in proportion. A very large part of the increase of the railroads' cost of living has been forced upon them by legislation increasing their taxes and the number of employes and by the arbitration of wage disputes. At the same time, the roads have been restrained by authority from compensating themselves by increasing their income from transportation. The railroads' statement of the case is reinforced by statistics which make their situation plain.

The roads, in fact, state the case so clearly that the public is likely to be reconciled to the increase of five per cent should the Interstate Commerce Commission grant it.

Buffalo (N. Y.) Express, November 27, 1913.

The rate question should be passed upon strictly on its merits. Regardless of what has gone before, have the railroads as large an income as they should have to do all that is required of them and pay fair returns to investors?

Buffalo (N. Y.) Times, May, 1913.

The railroad managers are speaking plainly and apparently honestly on this subject. They present the proposition that, if expenses are to be advanced, they must be permitted to advance rates. The facts behind the agreement are impressing the public mind and creating the sentiment to bear with good humor whatever compensatory advance of rates may be necessary.

Buffalo (N. Y.) Times, December 16, 1913.

General sentiment seems to be in favor of granting the five per cent additional freight rate, for these reasons among many others: Railroads, like other businesses throughout the country have increased the pay of their employes from twenty to forty per cent. With this advance in the pay of the workingman has come almost a corresponding decrease in the hours of labor.

While some lines of enterprise may be able to increase the wages of the worker, and at the same time keep abreast of operating expenses and pay a dividend by greater volume of business, in railroad management, wherein labor forms so large a part of the cost of operation, increase in volume of business alone, is not enough to maintain proper standards of equipment and operation and pay a fair dividend to stockholders.

There seems to be a deep-seated impression among the people generally, that it would be a good thing for the public, for the Interstate Commerce Commission to grant the five per cent increase in freight charges, asked by the railroads.

Buffalo (N. Y.) Times, December 18, 1913.

It appears to be the very general consensus of opinion, that granting, by the Interstate Commerce Commission, of the five per cent increase in freight rates, which the Eastern railroads are asking, would give a powerful impetus to the business of furnishing railroad supplies, and thus would materially assist the prosperity of the wage-earner and the country.

Railroads in the East have been curtailing their orders of rails and other equipments, because they find it impossible to purchase these materials in such quantities as are necessary, and at the same time maintain operating expenses and pay the trainmen and conductors the $6,000,000 yearly additional wages which must be paid under the recent arbitration award.

That this award was fair and just, is undisputed. But the cost it entails is an economic factor which must be reckoned with in arriving at a correct understanding of the railroad situation.

The railway supplies business is an immense industry. It employs more than a million workers, and these in turn furnish means of support to approximately three or four million people. Add the businesses engaged in supplying those directly or indirectly dependent on the railroad equipment industry, with food, clothing and shelter, and we have some idea of the vastness of the scope of that industry, and its intimate relation with the general prosperity.

Five per cent additional in freight rates, a percentage moderate in itself, which would not be an appreciable burden to the shipper, and would not be felt, or indeed, scarcely realized, by the masses, would be money well invested by setting the railroad supplies industry on its feet, and thus giving a boost to prosperity all along the line, especially in the Eastern States.

Buffalo (N. Y.) Times, December 20, 1913.

The elaborate and instructive report of the Interstate Commerce Commission, just made public, contains many suggestions for safety, notably the recommendation for installment of steel cars on all high speed trains.

That this precaution and all others necessary for preservation of life and limb of railway passengers and employes, should be adopted "The Times" cordially agrees.

But it cannot fail to impress the Interstate Commerce Commission, as it does all, that these needful and urgent recommendations carry with them a heavy expense to railroads, and this has important bearings on the application for a five per cent increase in freight rates, soon to be heard by the Interstate Commerce Commission.

To carry out the necessary improvements, the railroads must have money with which to do it. Granting this request for a moderate additional freight rate, a per cent so small, that it will nowhere be felt as a burden, would materially assist in solving the imperative problem of railroad safety.

Brooklyn (N. Y.) Citizen, May, 1913.

It should not be the province of the Government to starve the railroads into bankruptcy, for by so doing the greatest of all our public utilities will be crippled and made useless, and the millions who have their little patrimony invested in the stock will meet with hardships that they cannot well suffer.

Brooklyn (N. Y.) Citizen, November 25, 1913.

Since the existing rates went into effect, operating expenses and taxation have increased at a greater rate than operating revenues, so that the railroads find themselves in this position, a smaller net income with bigger revenues and larger investment of capital to meet the demand for improvements and increased efficiency.

In view of all the circumstances, the request for an increase of five per cent in freight rates seems moderate. The railroads are a necessity, and in order to maintain them at the highest point of efficiency, the capital and energy put into them must show an adequate return.

It is true that the growth of the country sees a steady increase in gross revenues from operation, but this increase goes hand in hand with the corresponding phenomena of increased taxation and increased wages. The trouble with the railroad situation is that the latter increase has been greater than the former, so that the railroads find themselves in the unfortunate condition of doing a larger business with less actual net return. Naturally, values of railroad stocks show a decline, and capital for needed improvement becomes more difficult to obtain.

Brooklyn (N. Y.) Eagle, November 24, 1913

It is significant that among the supporters of the application are a number of large shippers whose expenses will be materially increased in the event of a favorable report. These men, however, realize as all intelligent Americans must, that the railroads are being crippled by the exactions of the labor unions, by the greater cost of supplies, by such freak legislation as full-crew bills, and by the difficulty of raising money to meet the cost of expensive improvements. And in spite of the handicap which those burdens impose, the railroads are living on freight schedules prepared when conditions were very much more in their favor than they are to-day.

Railroads cannot be run at a loss. They cannot even be run on profits so small that investors will decline to purchase their stocks. They must have a chance not merely to exist, but to progress. Their prosperity is part and parcel of the country's prosperity, and injury to them implies injury to a great variety of other enterprises.

Ithaca (N. Y.) Journal, January 7, 1914.

There is no question that the showing made thus far by the railroads before the Interstate Commerce Commission has been very strong.

The railroads are entitled to reasonable compensation for their services. The companies have been compelled the past few years to raise the wages of thousands of employes and to undergo other expenses, but have not been given a chance to gain anything in turn. An advance in freight rates would not take money out of the pockets of anybody except a few big shippers. It could not be made a reason for boosting the prices of goods as the advance asked for is so small that it would mean practically nothing to the average shipper.

Kingston (N. Y.) Leader, January 12, 1914.

The matter of an increase of five per cent in the freight rates in what is known as the Official Classification Territory is now before the Interstate Commerce Commission. It is generally conceded in behalf of the railroads that their operating expenses have been heavily increased, that wages are higher, that materials cost more, that various regulative measures enacted by Congress and the State legislatures have added to their burdens and at the same time made inroads on their earnings.

The increase in rates asked for is moderate and practically horizontal, treating all shippers and all districts alike. There is no organized opposition to the advance. Shippers are not finding fault with it to any extent. The important commercial bodies of the country seem to allow that the railroads are reasonable in their demands.

Mt. Vernon (N. Y.) Argus, December 10, 1913.

These figures give some indication of the position of the railroads, and show why their net earnings are reaching a point where dividends are in danger.

Everybody knows that railroads must earn more than dividends if they are to keep pace with the growth of the country, so it is apparent, if their figures are correct, that they must be allowed to earn more money, or that every line of business in the country will suffer.

The country cannot prosper if the railroads do not.

New York American, May, 1913.

The granting of the Eastern railroads' application for (five per cent) higher freight rates would have immediate and marked effect in restoring confidence in railroad securities. Not a few railroad bonds are now at panic prices, while stocks in several prominent instances are at the lowest levels in recent years. The costly floods and the adoption of higher wage scales have aggravated the situation.

New York City, American, December 11, 1913.

Let the business world know where it is at. Let the railroads know whether they may resume placing orders, and thus stem the rising tide of unemployment, or whether they must adjust themselves to conditions they complain have become well nigh intolerable. Let investors have an idea of where they are to stand.

Everybody just now is in the dark. Everybody is guessing—and fretting.

A decision favorable to the railroads would do more than any other single act to check the oncoming march of hard times and start a revival in business, in investments and in confidence.

New York, The American Review of Reviews, November, 1913

The "cost of living" for the railroads throughout the country, augmented as it is by numerous money-devouring improvements demanded by the public but returning no additional income, is making the lot of the railway administrators anything but a happy one, and is leading to open talk of eventual government ownership.

Among business men it is very generally conceded that there is now at least a fair question whether the roads should not be allowed some increase in freight rates that will allow them to stand the higher wage schedules and other enhanced expenses and still have something left over to invite capital. The new capital must be had, in great volume, to furnish the better facilities, safety appliances, and comfort that the country demands.

New York, Bache Review, April 5, 1913.

"It is remarkable that the condition and needs of so great an industry as that of the railroads—the largest industry we have in our commercial world and the one whose prosperity affects favorably all other enterprises—should be neglected. But the railroads for several years have been laboring under adverse conditions, the result of unwise legislative action, and there seems to be no coercive force to relieve them.

"The roads are being hampered by the Interstate Commerce Commission, by the Government in mail contracts, by state legislators and commissions, and by labor combinations.

"The burdens imposed upon them and the privileges withheld make it impossible to earn adequate sums to protect and insure dividends with ample margins of safety and so build up credit, attract investment, and make badly needed equipment and terminal expenditures in sufficient proportion to keep pace with the country's growth and facility-needs. Taxes have been increased enormously and higher wages are being constantly demanded. This week the Full Crew bill was signed by Governor Sulzer and will add $2,000,000 to railroad expenses in this State. This same character of bill was vetoed by former Governor Hughes and Dix and has been killed recently in many States. Railroad men and experts say that no greater safety will be obtained under this bill, but rather that it will prevent other expenditures for real safety which cannot now be afforded.

"Fair play for the railroads should be demanded by the business public, whose vital interests and those of the whole people are damaged by continuance of the present conditions. The four million investors in railroad stocks should make themselves felt in state and national legislatures."

New York Commercial, May, 1913.

Shippers of course will object on general principle to increase of rates; but it is far more important to them that the carriers shall be in the highest degree effective and fully competent for the best work in transportation, than that the rates should remain as at present.

New York, Drygoods Economist, November, 29, 1913.

For one thing, the railroads of this country are not owned by a few millionaires; their stocks and bonds are widely distributed, and, it is, therefore, a large section of the people who suffer if the roads cannot pay fair dividends.

But, above and beyond all this, the public must be carried from place to place rapidly, in comfort and in safety, and freight must be moved on time. When, for lack of funds, the equipment of the roads becomes inadequate, producers, distributors and consumers alike must bear their share of the burden. Not only this, but there are vast sections of this country whose development is now seriously delayed by lack of transportation facilities.

There will always be three camps, the ultra-radical, the pro-railroad and the dispassionate—in which last, of course, the Interstate Commerce Commission and the business men of the country should belong. All who are in this third group will consider whether the saving effected by a maintenance of the present rates would not prove far more costly than would an advance of five per cent—in other words, whether the saving in freights might not prove a small matter in comparison with the increased trade made possible by better and more extended transportation facilities.

New York, Evening Globe, December 9, 1913.

On the state-owned railways of Italy, Switzerland, Belgium, Hungary and Denmark, material reductions in net income have occurred and in all these counties the governments have increased rates. In Australia in six years the railway revenue devoted to wages has increased from 37.30 per cent to 49 per cent and in the same time the surplus after other expenses were met has fallen from 12.97 per cent to 2.77 per cent. To prevent the disappearance of surplus altogether the government has announced from the commencement of the current fiscal year an increase of rates. Railroad rates abroad, though already from 50 to 100 per cent higher than the charges in this country, have been advanced from five to ten per cent during the last two years.

New York City, Evening Post, November 25, 1913.

The case in support of the application of the railroads for permission to increase their freight rates, as submitted to the Interstate Commerce Commission, is very strong. If the facts as stated are correct it is difficult, if not impossible, to resist the conclusion that the railroads are entitled to relief.

Three years ago "The Globe" practically alone among the newspapers of New York, opposed the increase of freight rates then asked for. It did not think that the railroads had established their case. The figures then showed a rising instead of a failing divisible net income. We thought it unfair to ask the Commerce Commission to guess concerning the future and to authorize higher rates on the ground that perhaps they might be necessary. We thought it reasonable to ask the railroads to wait until such time as they could show actual impairment of the income.

The reasoning that supported opposition to an increase of freight rates three years ago now seems to require approval of an increase. Outgo has caught up with and passed income. The Commission faces facts fundamentally different from those of three years ago.

New York City, Evening Sun, November 24, 1913.

In the year 1908, six-tenths, or very nearly, of every dollar earned by the railroads of the country was paid out for labor, in one form or another. Less than two-tenths, less than one-third of the labor bill, went to pay the interest on the railroads' debt and the dividends. And of the railroads' debt, an enormous portion, in turn, represented nothing save money originally paid to labor for the roads' construction and equipment.

Since 1908, when these figures were attained, two large increases have materially raised the labor share of the dollar earned by the railroads. But there is still only a dollar. No general increase in railroad transportation rates has taken place, for none has been allowed. Therefore, the added wages are being paid partly out of sums formerly put into betterment of the properties.

The moderate fruits of railway enterprise to the owners have been severely pinched back, at the risk of discouraging the railways' future development, which cries for more capital, even while our laws blight the capital already invested. Now is high time for the Government to take steps to end this situation with its all-around danger to the country at large.

New York City, Evening Sun, November 28, 1913.

Railroads that haven't proper facilities and no money to get them can't be as useful to shippers as those that have. New and efficient servants are hard enough to get, but new and efficient railroads are infinitely harder. Shippers and railroads have more things in common than both sides seem to imagine. And everybody else in the country has some financial interest, however small, in the outcome of the controversy.

New York, Financial America, May, 1913.

Railroads cannot operate without capital. They cannot secure capital without credit. The present state of the bond market shows that railroad credit is not a certain attraction for the investor. Under this condition the carriers cannot give the country necessary traffic improvement, because they have no available money for such a purpose; and it is out of the question for them to assume the obligation of obtaining it by means of high interest-bearing, short-term financing.

New York Herald, May, 1913.

Unless they are promptly permitted to increase their charges they cannot continue to supply efficient service even on the present basis, and are assuredly unable at this time to comply with the unreasonable demands of employes, involving further enormous increase of operating cost.

New York City, Herald, December 12, 1913.

We believe that conditions in this country are good and that the railroads are going to continue to make money, but in making that statement, we also voice faith in the ultimate wisdom of President Wilson and his Interstate Commerce Commission at Washington. It would seem to many persons that the time has almost been reached when some assurance of a favorable character should be given by them.

New York City, Herald, December 16, 1913.

And the railroad situation can easily be remedied. The Interstate Commerce Commission has an ill patient on its hands. The plain truth about it is that this situation must be met and should be met quickly. There has been more humbug in the attacks upon the railroads than in any other discussion before the public in the last ten years.

The country has stood by and seen the railroads required to put forth in increased expenses sums which but for the most extraordinary economies would have eaten up the entire gross operating income. We think public sentiment is going to move that glacier at Washington known as the Interstate Commerce Commission. Perhaps a few thousand idle locomotive builders marching down in a body would help start it.

New York Journal of Commerce, May, 1913.

Where the prospect of net earnings is uncertain there is a risk in railroad investment which demands a high rate upon loans and makes the placing of new stock difficult. It makes the raising of capital costly and the cost must be met out of earnings. This restricts improvements and cripples service as the demands of traffic increase. There is no way of relief but in such an advance in the rates to be charged for service as will produce a condition of greater ease and confidence. This concerns the interests of shippers and the public as much as it does the railroads and the investors in their securities. Rates for railroad transportation are among the smallest items in the cost of doing business and meeting the wants of producers and consumers in the distribution and interchange of commodities.

New York Journal of Commerce, October 31, 1913.

There must be a great deal of new capital raised, and for that the credit of the companies must be maintained. The basis of their credit is earning power and that can be sustained only by sufficient rates for a return upon investment that will invite further investment in their securities. This is a matter which does not concern alone the management of the roads and their creditors and shareholders. It concerns as well their shippers and the industries and business of the public. It is a question whether the increase in rates asked for, diffused as added cost throughout the producing and trading community, will be equal to the loss that would follow from a failure to provide adequate facilities for transportation—whether, in point of fact, it will not result in saving and gain instead of loss as it works out its effect. What the Commission has to consider is whether the increase in rates will not be in the interest of the public even more than that of investors in railroad securities.

New York Journal of Commerce, November 28, 1913.

The raising of new capital is something that cannot be done at will. Present investors may be forced to stand loss, but new investors cannot be compelled to take securities. They must be attracted. There must be the inducement of an assured return as good as can be obtained from other forms of investment. The railroad companies must have credit, and credit depends upon being in position to pay a fair profit upon investment. It depends upon earning power. If an advance in rates is necessary to enable the railroads in the joint traffic association territory to raise capital for needed facilities in order to render the service which the public demands and to which it is entitled, that ought to settle the question, for it is primarily the public that is to be benefitted and not the railroads as a separate financial or business interest. It is the interest of the public which the Interstate Commerce Commission is bound to consider and in this case it is inextricably bound up with the interest of the railroads.

New York Journal of Commerce, December 18, 1913.

The railroads should be allowed to frame their own schedules of rates and file them, subject to subsequent correction where they can be shown to be excessive, ill-adjusted or in any way unjust or unreasonable. It is for the interest of the railroads to make them favorable to the industrial and business activity of the country, and they can be held accountable for discrimination or injustice without being bound hand and foot and held down by an inert body of officials with an intolerable load on their shoulders. The railroads have had their lesson and are suffering their penalty. What they need now is more freedom of action within legal limits and under rational supervision, and not further bondage or absolute death, with politicians waiting to seize the carcass.

New York Journal of Commerce, January 12, 1914.

Shippers of merchandise are showing an increasing interest in the question of allowing the Eastern railroads to have the advance in rates for which they have applied to the Interstate Commerce Commission, and in having that question disposed of without unnecessary delay. They are evidently coming more and more to realize that the interests of business do not lie in screwing rates for transportation down to a point where it will impair the capacity of the railroads to keep up their service. It will cost business much more to have transportation hampered, delayed or endangered for lack of adequate facilities than it will to pay sufficient rates for the service to enable the roads to keep up their facilities and their efficiency in operation.

New York, Leslie's Weekly, May, 1913.

At heart the American people love fair play. Whatever may have been their sins in the past, the railroads are to-day striving against great odds to give the public the best sort of service.

New York, Leslie's Weekly, May, 1913.

"It seems very simple to see the passenger trains run in and out of the station; to order the freight car and send the grain to market; to telegraph to the nearest large town for supplies, and in 24 or 48 hours have them delivered. But it is not so easy and simple as it seems, and there is danger to-day that the next great uplift in business in the United States will find the railroads, as a whole, sorely taxed to furnish the transportation needed for the commerce of the country. Why? Because a misdirected public opinion is demanding rates too low, taxes too high, wages too high, service too elaborate, and there are not cents enough in the dollars to meet all these obligations and still permit the business to be attractive enough so the man with the dollar will invest it. Our American railroads have done good work, and can do better, and it is to the farmers' selfish interest to see that they are so treated that they will be ready at all times to handle business. To be ready requires constant expenditure."

New York Mail, May, 1913.

"There seems to be justice and common sense in the proposed application of the Eastern railroads to the Interstate Commerce Commission for permission to make a five per cent increase in their freight rates.

"The time has come when Government recognition of rates should be justified by a spirit of fair dealing and a recognition of actual conditions.

"Nowhere in the country is there a sign of public opinion that favors a policy of discouragement or actual hostility to legitimate railroad enterprise.

"There is no reason why sound railroad enterprise should be harassed or destroyed.

"There is no reason why the railroad companies should not be able to make improvements necessary to the country's progress and prosperity, to allow reasonable advances in wages and to meet unavoidable losses.

"There is no reason why the transportation facilities of the American continent, so vital to its industry and commerce, should be gradually forced into unprofitableness to meet the purposes of political demagogues and fanatics.

"It is not merely the falling prices of railroad securities in the stock market that signals the danger of the present iron policy of restricting railroad rates. The refusal of the public, both here and in Europe, to invest money in new bonds or other securities of the foremost and best-managed American railroads, save at almost prohibitive prices, shows that we have passed the line of prudence and reason in restricting the profits of our transportation systems.

"While the tide of wages keeps rising and must be met, if the public is to be saved from the engulfing calamity of a general railroad strike, one group of Eastern railroads is called upon to repair a loss of more than $20,000,000 caused by the great floods in Ohio and Indiana.

"In the light of these and other similar facts it seems plain that the Interstate Commerce Commission should give dignity and strength to the law by a reasonable and fair use of its powers. No good can be accomplished by crippling one of the chief means through which the productive life of the nation is made effective."

New York Evening Mail, May, 1913.

Nowhere in the country is there a sign of public opinion that favors a policy of discouragement or actual hostility to legitimate railroad enterprise. On the contrary, both shippers and the general public desire reasonable treatment of the railroads. It is not merely the falling prices of railroad securities in the stock market that signals the danger of the present iron policy of restricting railroad rates. The refusal of the public both here and in Europe, to invest money in new bonds or other securities of the foremost and best-managed American railroads, save at almost prohibitive prices, shows that we have passed the line of prudence and reason in restricting the profits of our transportation systems.

New York, Munsey's, June, 1913.

The request which some of the railroads have made for a small increase in rates is moderate, indeed, compared to the additions to their payrolls. There would seem to be justification, even to the satisfaction of the most rabid corporation critic, for an increase of rates that would enable them to keep their track and equipment up to the highest standard of efficiency and safety.

New York, The Outlook, December 6, 1913.

As we have repeatedly said, it is a perfectly fair and right thing that the railroads should be allowed to increase their rates, both for freight and passenger, if that is needed in order to insure safety to passengers, the best equipment, provision for future needs within reason, together with just and fair wages for employes. To determine whether the demand is or is not called for by actual conditions is the laborious task of the Interstate Commerce Commission, and it is one of the greatest industrial gains of our time that such a Commission with such power should exist. To quote a passage from Mr. Roosevelt's editorial in "The Outlook" of last July, called "The Living Wage and the Living Rate":

"The Commission is no true servant of the public unless it unhesitatingly raises the rates when justice in the public interest requires such action, and unhesitatingly lowers the rates when this is the course which will ultimately best meet the public needs. Unless the corporation makes money—that is, unless business men are prosperous—there will be no money to give in proper wages for the wage-worker, there will be no money with which to provide for his protection and insure him against loss and damage, and no money wherewith to render proper service to the customers and to the public as a whole. Our purpose is to see that there is a proper division of prosperity."

New York Press, May, 1913.

There are three ways. One is to fail to make improvements, fail to keep up the roadbeds, fail to maintain equipment, fail to serve the interest and guard the safety of the public. That way is criminal. A second is, as wages were advanced when this could be done on increased traffic, to cut them on falling earnings. That way is the very rare way, fought bitterly by labor. Third is to let the public pay. That way has been averted for some time by the Interstate Commerce Commission. But if the railroads' limit has been reached, it may be the necessary way.

New York Press, December 8, 1913.

The plain English of the foregoing railway statistics is that such a record makes for a situation, sooner or later, where there will not be enough tracks, freight cars and passenger coaches to serve the need of the public as the American people have always demanded they must be served. The extreme development of such a situation would mean nothing less than the break down of free and full transportation exchange of the Nation's products between all parts of the country. That would mean crippled mills and factories, marooned farms, imperiled wage earners and harassed consumers.

New York, Puck, May, 1913.

To-day a railroad must buy new and heavier rails, stronger cars, build heavier bridges, install protective devices and expend vast sums for larger terminals to avoid delays to shippers. To get money for these things a railroad, like anybody else, must turn to the man with money to lend and offer him something for it. The man with money to lend, in turn, naturally is going to investigate conditions before he lends his money. And there is no law known to our land which is going to make him go down into his pocket for the railroad and for his fellow man if he does not like the looks of things.

New York Times, May, 1913.

It might seem that there is no good time for the advance of railway rates. Nobody can afford to pay higher rates when times are bad, and when times are good the companies have so much business that they cannot make out a case of poverty. The Commission could not ask for a better opportunity to magnify its office than by showing it is truly a judicious, judicial, and benevolent body holding the scales true between the opposing sides of the railway question.

New York Times, November, 1913.

Another example of the conscienceless attitude of the Government toward public utilities is shown by the attitude of the counsel employed by the Interstate Commerce Commission in the matter of the advance of freight rates. Mr. Brandeis proposes to use the application as a lever for reforming the alleged abuse of interlocking directorates. The railways ask to be allowed to pay their bills, and Mr. Brandeis proposes to listen when they have improved their financial methods in a manner satisfactory to him. It is as though when your tailor sends in his bill you should refuse payment because he does not live with his wife. He ought to live with his wife, and it might be that if his bills were paid he might be better able to do so. But the payment of the tailor's bills and the reform of his morals ought to be dealt with each on its own merits. Nobody would object to Mr. Brandeis's ravaging reforms in their season, but the payment of bills cannot await the process. The Interstate Commerce Commission reports this week that the railways' gross earnings for September increased $17,000,000, and the net fell $5,000,000. The railways are paid by piecework. They are indisputably working harder for less pay. They have pieced out their earnings by borrowing and spending $335,000,000 which must be paid or funded within a year if the railways are to be kept solvent. That the companies can travel this road no farther appears from the economies which they are practicing to the damage of other interests than their own. The railways' contracts for rails this year have decreased seventy-two per cent, car contracts have decreased forty-two per cent, locomotive orders decreased thirty per cent, structural orders decreased twenty-five per cent. The Eastern independent steel companies are running forty per cent capacity, and the larger interests are doing but little better. It is idle to say that the railways are wilfully extravagant when they are not allowed to control the expenditure of their income. They are told how much money they must spend, and how they must spend it. They ask to be allowed to collect the money they must disburse, and they are told that they must reform their morals. They should do whatever they ought, but they must meet their bills at the due dates. Even if Mr. Brandeis were to assist the process of giving them permission it would be months before the order were entered. Meanwhile the outlook is that the larger rates if collected will be upon a smaller volume of business.

In business not Government controlled, prices are raised when business is overwhelming and prices are lowered when dwindling business needs encouragement. The reverse of this customary and approved practice is a novelty whose outcome is obscure. In contempt of counsel Commissioner Marble said to the "Times" that the Commission was striving to make private management of railways profitable. The next day he recalled his words, and Counsel Brandeis's utterance of stern virtue was made. This oppression of the railways is practiced not because Counsel Brandeis is better than other men, or the Commissioners worse, but because of an assumed popular mandate. The people have allowed the oppression to run along on the idea that the railways were too big and rich to be damaged. The people are in the way to discover that the railways can be injured, and that the injury will recoil upon the people.

New York City, Times, January 6, 1914.

If the Interstate Commerce Commission finally decides to add to the revenues of the Eastern railroads by granting them the five per cent increase asked for, several million people in the United States will be fully qualified to say: "I told you so." Everyone who is willing to be quoted, either thinks the roads ought to get the increase, or will get it.

New York Tribune, May, 1913.

The public is interested not only in seeing that the railroad workers receive a living wage. It is interested even more vitally in seeing that the railroads receive a living wage. The railroads must earn enough for their own upkeep. They must earn enough to have a surplus to put into non-dividend paying improvements, for the public demands them. They must earn enough to grow as the country grows.

New York Tribune, June 23, 1913.

For the last four or five years the carriers have been in the unenviable position of being forced to increase their expenses without being allowed to enlarge their income. The cost of everything which they have to purchase—equipment, supplies and labor—has been going up, but they have been restrained by the government from increasing the price of transportation—the only thing which they have to sell.

Federal control has been for them an absolutely one-sided bargain. Congress has passed a law, which public opinion strongly supports, providing for the arbitration of wage disputes between the carriers and their employes. The railroads have gone into many such arbitrations, and the result of each one has been to give the employes a substantial increase in wages. More arbitrations are in sight, and the railroads are virtually asked by the government and the public to go on increasing their expenses of operation while they are debarred by federal authority from seeking the higher returns for service needed to meet the added cost.

That attitude toward the carriers is grossly unjust. It is the duty of the Interstate Commerce Commission to see that the railroads are allowed to earn enough to offset the new burdens constantly put upon them as agencies responsive to governmental supervision. Under the present scheme of regulation the balance has been running steadily and strongly against them. In the interest of fair play it ought to be redressed.

New York Tribune, November 25, 1913.

The old period of hostility and suspicion is passing. When the railroads come forward and point to the fact that added burdens of taxation, increased wages and the advancing cost of supplies and equipment make necessary a larger income than can be earned on the basis of the present rates hardly a voice is raised to dispute the justice of the claim.

A great step forward has been made toward relations of mutual confidence between the public and the railroads since the last proposal to increase rates was unfortunately made. To grow in public esteem and trust the railroads have only to use the surplus returns which they will receive from the higher rates which they seem certain now to get exactly as they now promise to use them—in improving service, increasing safety of travel, enlarging facilities and generally in promoting their own prosperity and that of the communities which they serve. The people are willing to pay for a better and safer service.

New York Tribune, November 28, 1913.

The railroads have perforce been as economical in their management as they knew how to be, and yet operating and maintenance charges and taxes have increased more rapidly than gross earnings. The roads have increased their facilities and improved their service but they earn less.

This process cannot go on. Either railroad earnings, that is to say, their net earnings, must increase as the railroads grow or the growth of the railroads will stop. The real interest of the shippers is not so much that freight rates should not advance as that the railroads should not stop growing. All the prosperity of the country is based upon adequate facilities of transportation. Without adequate earnings there cannot be adequate facilities.

New York City, Tribune, December 22, 1913.

If the Commission admits the need of more mechanical safeguards and greater skill in operation and the public is more and more concerned about making travel safe, another argument is created for treating the railroads fairly in the matter of freight and passenger rates. All-steel cars, the latest block systems and better educated and more responsible engineers and trainmen all cost money, and their cost to the roads ought to come back in the shape of larger earnings. For the last ten years the policy of the government has been to involve the railroads in larger expenditures while forbidding them to increase their income. A much better service for the public has been obtained at the expense of the railroad stockholder. It would be a glaring injustice to go on making the stockholder pay for every improvement in facilities. The only logical complement to a demand on the railroads for safer service is an order giving them the means to furnish it through higher freight rates.

New York, Wall Street Journal, May, 1913.

It sounds plausible to argue from an apparently great increase in the gross amount of dividends paid by the railroads that they are doing well enough, but such argument ignores the vast money investment of the past ten years represented by stock and the conversion of bonds into stock, through re-organization or otherwise. In fine, this pseudo-argument is a convenient way to avoid the fact that the actual return on all railroad capital is declining, and has been declining almost steadily for at least six years. Barring temporary fluctuations, it has probably been declining for a much longer period.

New York World, May, 1913.

If the railroads are compelled by law and by arbitration proceedings to spend more annually, a point must inevitably be reached where the railroads will be justified in seeking fair compensation through higher rates.

New York World, November 25, 1913.

It is for the Government, through the Commission, to do justice. It has assumed the rate-regulating power, and that is a power to increase rates when fairness demands as well as to reduce rates when fairness demands. It is a power which must be so exercised. The country must have railroads and better railroads, and no power of Government can force new capital into the roads or keep old capital there when income has been forced below what can be earned elsewhere.

New York City World, January 4, 1914.

Next in significance to the note of hope that appeared in the telegrams from important business men throughout the country printed in "The World" was the assertion of intimation by many that the one thing now needed to restore confidence is an increase of railroad freight rates.

Rochester (N. Y.) Democrat May, 1913.

The Interstate Commerce Commission has not been friendly to requests of this nature in the past, taking the ground that the rates in operation were sufficient to meet expenses. It cannot, however, fail to take cognizance of the grants of increased wages. Nor can it fail to take cognizance of the fact that something must be done to reassure the investing public, which is certain to fight shy of railroad securities unless the railroads can be placed on a more promising financial footing.

Rochester (N. Y.) Democrat and Chronicle, November 25, 1913.

If the railroads that have asked the Interstate Commerce Commission for permission to increase freight rates five per cent, do not receive an affirmative response, it will not be for lack of evidence to support their claim that conditions demand such an increase.

The demands on the roads in the way of wages, increased facilities and new equipment, are constantly increasing. There is only one way that the railroads can meet these demands, and that is by increasing revenues.

Rochester (N. Y.) Evening Times, May, 1913.

It is public sentiment, the companies having proved pretty clearly the need, that there should be an increase in revenues for the railroads. While there has been an advance in rates in all other kinds of business, the railroads have met greatly increased expenses, without getting consequent revenues in return. The Interstate Commerce Commission, the State lawmakers and the public in recent years sometimes have been unduly antagonistic to the railroads. It is time a halt was called and the railroads given fair treatment.

Rochester (N. Y.) Post Express, May, 1913.

According to the Commission's own figures, the operating income of Eastern railways earning more than ten million dollars a year declined in 1911, $32,968,341, although the mileage included was five hundred greater than in 1910. The conditions outlined will be cited by the railway managers in their argument for the advance in rates. The Commission may wisely give them careful consideration, for upon the prosperity and consequent advancement of railway interests depends in large measure the business activity of the country.

Rochester (N. Y.) The Post Express, June 2, 1913.

It is hoped that the country has seen its last "fight" over freight rates. As Professor William Z. Ripley, of Harvard, has said, it is desirable that shippers and the public shall appreciate the burdens of cost which have been and are being laid on the railroad companies, the task which must be performed by the companies in order to meet their obligations to the public in the matter of equipment and service and the allowance which should readily be made for the greater things demanded by the enormous growth of agriculture, commerce and industry.

Rochester (N. Y.) Times, June 17, 1913.

There is a growing public opinion that legislation hostile to or tending to hamper the railroads has already been carried quite far enough and that if continued will be a detriment not only to the railroads but also to shippers and the public in general.

Rochester (N. Y.) Times, November 28, 1913.

Not only have legitimate expenses increased and the railroads added to their investments and therefore to their interest charges in the last few years, but it is certain that they will have to make great additional expenditures in order to handle business in the next few years. Double tracks, safer signals, larger locomotives and cars, heavier rails and many other articles of new equipment must be purchased. These expenditures can only be met by bond and stock issues and the interest and dividend charges must come from increased rates.

Rochester (N. Y.) Times, December 1, 1913.

The proposed general advance of five per cent in rates that this increase would afford, would only cause the slightest disturbance to the commercial world and would be of considerable benefit to the development of their properties. A leading railroad official estimates that the increase asked would add between $35,000,000 and $40,000,000 to the revenues of the 52 railroads involved.

Many of the largest shippers have endorsed the application of the railroads. It is obvious that the railroads must earn a fair percentage on their investment in order to keep in condition to handle the nation's business. The legitimate, absolutely necessary expense of the roads have increased so much in recent years that there is a general public feeling they are entitled to a rate increase to balance these higher expenditures.

Syracuse (N. Y.) Herald, December 30, 1913.

The hope seems to be pretty general that early in the New Year the railroads will receive a gift from Uncle Sam—or, more specifically, from the Interstate Commerce Commission—in the shape of a permit to increase their freight rates five per cent.

Several strong arguments have been offered in support of this plea, and some of them have already been examined in these columns. The strongest of all, however, is found in the record of wages increases forced upon the railroads during the past three years. For the fiscal year ending July 1st last, the Eastern railroads paid out in wages and salaries the colossal sum of $506,000,000. The really significant thing is that this represented an increase of $50,000,000 in round numbers, as compared with 1910. The figures are official. Upon the New York Central alone the wage increase imposed a burden of about $10,000,000.

We need go no further for reasons why the Eastern railroads are entitled to that New Year's gift.

Syracuse (N. Y.) Post-Standard, December 8, 1913.

The Eastern railroads have asked the Interstate Commerce Commission to allow them to increase their freight rates five per cent. They asked for an increase a few years ago and were denied. Since then their expenses have increased greatly and there must be more revenue or the roads will be forced not only to curtail needed improvements, but to institute drastic economies which will seriously hamper their service to the public.

In view of the great increase in cost in the period since the Commission last heard the railroads' request for permission to raise their rates, and the decrease in net income, the Commission will hardly decline this time to allow the railroads to make their charges more nearly commensurate with their needs.

Troy (N. Y.) Times, May, 1913.

There are distinct indications of a public awakening to the fact that it is possible to kill the goose that lays the golden eggs of prosperity. One of the ways is to deal unjustly with the railroads and prevent them from expanding their facilities to meet the public needs. This phase of the subject is receiving thoughtful attention, an example of which is furnished by the action of the New Hampshire Legislature in directing the preparation of a bill that shall permit the Boston and Maine Railroad to raise rates above the limit now fixed by the law of that State.

Utica (N. Y.) Herald-Dispatch, November 28, 1913.

The case the railroads are making out in this hearing is vastly stronger and more compelling than the presentation of facts made when the last application for a general increase of rates was denied. The figures give proof of imperative need. A refusal of the Commission to grant the relief prayed for would be a shock to the country and a disaster to its greatest business interest.

Utica (N. Y.) Observer, May, 1913.

Much railroad stock is held by people of small means who have purchased it as an investment. It has often been said that one of the big railroad systems of this country is owned by widows, and they depend upon the dividends of from four to six per cent for their support.

Utica (N. Y.) Press, November 26, 1913.

That a dollar does not go as far as formerly, those who have had experience confidently assert. It is conceded that the necessaries of life cost more than formerly. The railroads have practically only two sources of income, passengers and freight. If they have to pay out more, they must make some arrangement for taking in more. There are two ways of retrenchment; one is to let the rolling stock deteriorate and spend nothing for new engines or cars and as little as possible for repairs or to cut operating expenses, which means cutting wages. It would seem on the face of it as if the railroads had a very good argument.

Watertown (N. Y.) Standard, January 9, 1914.

If there could be any doubt concerning the concession of a five per cent increase in freight rates to the Eastern railroads the action of the Illinois Manufacturers' Association in favor of the request should settle the matter favorably. The association had been on record opposing the increase. On Monday, it sent urgent letters to its 15,000 members requesting that they do their utmost to see that the increase was granted.

Railroads are the most enterprising corporations in the country. They pay the highest wages. When they can get money they anticipate the needs of the communities they serve. A railroad running at a loss or unable to secure capital for extensions and better facilities cannot give the shipper good service. For years expenses have been increasing through safety first efforts and higher wages.

PENNSYLVANIA.

REPLIES OF A FAVORABLE CHARACTER.

Mayor S. H. Walker of Altoona. (Population 52,127.)

(1) Quite a number of local business men in the community who are shippers on the railroads have volunteered the opinion in casual talks, that owing to the increased demands made upon the railroads by legislation of various kinds in recent years, the increase asked for should be granted by the Commission. Altoona is distinctly a railroad town, and local business men are af-

fected just about as much as railroad employes by the prosperity or adversity of the roads.

(2) I should say that if the increase is granted it should be promptly, leaving all minor matters to be settled later.

Secretary, George H. Mosser, Altoona Chamber of Commerce.

At a meeting, held on December 10, 1913, the Board of Directors of the Altoona Chamber of Commerce endorsed the five per cent increase asked for by the railroads. The brief formal motion which followed the complete discussion of the subject is as follows:

Resolved, That the Chamber of Commerce of Altoona, Pennsylvania, endorsed the proposed five per cent increase as in railway freight rates.

J. K. P. Fenner, Burgess of Ashley. (Population 5,601.)

(1) Yes, this being largely a railroad town benefited by the increased wages to railroad employes, they naturally feel some allowance should be made the companies to meet these additional payments.

(2) Yes, decidedly so.

Mayor James M. Yeakel of Bethlehem. (Population 12,839.)

(1) Yes.

(2) We believe it should be promptly settled one way or the other. Agitation and suspense never pay.

Thomas Scott, Chief Burgess of Bristol. (Population 9,256.)

(1) The consensus of opinion in Bristol appears to be that the increase in wages and taxes combined with decreased earnings, appear to give the railroads an entire justification in making their claim.

(2) Regulation by Congress controlling the issuance of railroad securities, if sanely carried out as a protection to the investor against fraudulent issues or efforts to defraud stockholders, would be a wise reform measure, but to confine legislation of this character to its proper sphere is a difficult proposition. It appears that we are already suffering from a plethora of laws.

Mayor of Chester. (Population 38,537.)

(1) Sentiment divided, but resolutions have been adopted by the Board of Trade vigorously approving the increase.

Secretary, Neil B. Sinclair, Chester Board of Trade. (Population 38,537.)

At the annual meeting of the Chester Board of Trade, held on January 15, 1914, the following resolutions endorsing the action of the transportation companies in requesting an advance of five per cent in freight rates, was adopted and original copy forwarded to the Interstate Commerce Commission:

Whereas, it has been brought to the attention of the Board of Trade of Chester and vicinity that the Transportation Companies have applied to the Interstate Commerce Commission for an advance of five per cent in freight rates, and,

Whereas, The Board of Trade of Chester and Vicinity believes that the granting of the proposed five per cent increase to the Transportation Companies would be a source of stimulation to the business interests of the country and particularly to those of Chester and Vicinity, and

Whereas, The Board of Trade of Chester and Vicinity is firmly convinced that Railroad prosperity and national prosperity go hand in hand, and

Whereas, The Board of Trade of Chester and Vicinity believes that in granting the five per cent advance in freight rates, the small increase requested is not sufficiently heavy to work a hardship or place a burden upon any of the business interests of the country and particularly those of Chester and Vicinity and also that the smaller retail merchants will not have cause for lament if the increase is granted, and

Whereas, The Board of Trade of Chester and Vicinity recognizes the fact that the Transportation Companies are and have been for some time put to considerable extra expense in every department by reason of recent legislation necessitating their supplying themselves with more expensive equipment and modern safety appliances and that the demands for increased remuneration are constantly growing more insistent, therefore

Be It Resolved, That the Board of Trade of Chester and Vicinity do and hereby does heartily and cordially endorse the action of the Transportation Companies in requesting this increased freight rate of five per cent made to the Interstate Commerce Commission, and

Be It Resolved, That this resolution be adopted and spread upon the minutes and that copies of this resolution be properly attested and certified and forwarded to the Chairman of the Interstate Commerce Commission; Mr. Charles Bye, Secretary of the Charles Warner Co., Wilmington, Delaware; Senator William C. Sproul, Chester, Pennsylvania and Mr. E. G. Ward, President of the "Railway World," Philadelphia, Penna.

R. J. Hardy, Burgess of Carnegie. (Population 10,009.)

(1) The sentiment of the business men in this community seems to be in favor of the proposed increase in freight rates, not because they think such increase to be necessary, but because it is believed that it would bring about a resumption of activities in business if the railroads would commence to buy their supplies on the usual scale, and it is felt that the railroads will not do this unless the increase is granted.

(2) I think that the sentiment is that the increase should be promptly granted, leaving the other matters out of consideration for the present.

C. J. Klein, Chief Burgess of Catasauqua. (Population 5,250.)

(1) Yes. A personal canvass of the larger shippers in this borough, representing a diversity of industrial and embracing the largest investment of. capital, gives an affirmative answer to your question. They believe that the increase in rates would improve the trade conditions in this section of the country.

(2) The sentiment is favorable to a prompt granting of the increase, recognizing, however, the probable necessity of readjustments.

Mayor of Columbia. (Population 11,454.)

(1) I have spoken to quite a few gentlemen connected with our large corporations informally, and I find they do not object to the rate increase, but that the railroads be compelled to give adequate returns by increased efficiency in the transportation of the freight. It is the consensus of opinion in this section that if the increase is granted, it will fall on the public, but that the railroads in turn will then go into the market with large orders for equipment, etc., and thus stimulate business, giving employment to more labor.

(2) Being favorable to the increase, public sentiment seems to think the advance should be granted, leaving readjustments to be made in the future.

E. C. Sithrich, Pres. Chamber of Commerce, Coraopolis. (Population 5,252.)

(1) A personal interview with the majority of manufacturers in this community reveals the fact that they are pronouncedly in favor of granting the increase.

(2) It is my personal opinion, judging from general conversation with a number of our townsmen, that the answer to your question No. 2 should be, Yes.

Secretary, P. S. Weber, Dubois Business Men's Exchange. (Population 12,623.)

Our Exchange has taken no action either for or against the five per cent freight rate increase. As to the attitude of our members, I have interviewed fifteen of our heaviest shippers and receivers of merchandise, thirteen of whom express themselves as being perfectly satisfied that the Commission would do the fair and the just thing and the remaining two, favor the increase.

Mayor W. J. Stern of Erie. (Population 66,525.)

(1) It is my opinion that the business men of our city, who are of the thinking element, are fully in sympathy with the railroad companies in their demand for the right to increase their rates. In talking with these business men I find that they all agree to the increase inasmuch as the railroad companies are paying higher rates of wages than formerly and paying higher prices for materials necessary for the upkeep of their property and that it is absolutely unfair that they should not be permitted to make an advance commensurate with the increased expenses.

Secretary, Frank W. Dillon, Erie Board of Trade.

Official action on railway freight rates has not been taken by the Erie Board of Trade, but is contemplated for the next meeting when a fair expression of opinion can be obtained from the assembled members. I have been interested in hearing the sentiments voiced by the 400 members, many of whom are proprietors and general managers of large shipping establishments, also professional and business men depending considerably on the prosperity of the city for lucrative business.

Their opinions differ largely upon two points. Some believe that the Interstate Commerce Commission is able and will grant the railroads any concessions that must be given to make business active. Others think that the railroads should be granted the increase upon proof that they require the same and that the grant will not be followed by requests for additional increase. The trend of opinion is that the railroads should not be crippled and prosperity of business and manufacturing stopped if a reasonable increase will continue conditions on a satisfactory basis.

Frank Smiley, Chief Burgess of East Stroudsburg. (Population 3,330.)

(1) From personal talks I have had with some of our leading business men they seem to be of the opinion that if a five per cent increase is necessary to make a reasonable return on investments, it should be granted.

(2) There is quite some difference of opinion on this question, but I think the majority are of the opinion that the carriers should first show that they need the increase for return on investments.

Mayor of Farrell.

(1) I have talked with a great many business men in regard to the proposed increases in freight rates and I feel safe in saying that it is their opinion such increase is absolutely necessary. They believe it would bring about a great business revival.

(2) Yes.

Secretary, E. S. Keay, Greensburg Board of Trade. (Population 13,012.)

While our organization has never acted upon this question, the writer has talked to some of our local shippers and finds that some of them favor the increase as a step towards restoring the prosperous condition in shops and mills. Nearly everyone to whom the writer has spoken on the subject thinks that the increase should be granted if the railroads can show the proper necessity for it, and would, I think, accept such an award by the Commission with favor. In other words, there is no evidence of opposition to the railroads as the people here want them to have sufficient revenue to make them prosperous, feeling that the general welfare of the community is very largely affected by the railroads' prosperous condition or the reverse. The writer personally feels that a complete poll of the business men of the community would result in a verdict favorable to the railroads.

J. I. Shaff, Burgess of Indiana. (Population 5,749.)

(1) Yes.

(2) Yes.

J. L. Bardine, Burgess of Juniata. (Population 5,285.)

(1) It is the sentiment of the business people of this city that the increase in freight rates should be granted, the opinion being that what is good for the railroads is good for the people.

(2) Yes.

Mayor John E. Reynolds of Meadville. (Population 12,780.)

(1) I believe beyond question, that the business interests are in favor of the increase of five per cent in freight rates. The prosperity of this community depends largely upon the prosperity of the railroads which are entitled to a fair profit.

(2) If the increase is to be granted, it should be at once and give business an early realization of the advantage.

E. M. Boynton, Manager, Meadville Chamber of Commerce.

The following letter sent to the Interstate Commerce Commission, sets forth the attitude of the Meadville Chamber of Commerce on the petition of the Eastern carriers to increase their freight rates five per cent:

To the Honorable Interstate Commerce Commission:
Washington, D. C.

Dear Sirs:

The Meadville Chamber of Commerce, of Meadville, Penna., representing the manufacturing and business interests of this city, recognize the fact that the eastern railway lines have had to materially increase their expenses in the matter of increases in wages to employes, as well as improvement in equipment, for the benefit of the public at large, and we earnestly recommend that the five per cent advance which the railroad lines have asked for, of your honorable body, be granted to them. We believe that the railroad rates are lower than conditions warrant, and the five per cent advance amounts to very little to the individual, but means a great deal to the railway lines, and we recognize the fact that their prosperity means a great deal to the general business interests of the country.

Yours very truly,
The Meadville Chamber of Commerce,
E. P. Cullum, President.

Attest:
E. W. Lawrence, Secretary.

A. G. Dunlop, Burgess of Monessen. (Population 11,775.)

(1) While the question of increased freight rates has never been openly discussed by our Board of Trade, in talking the matter over with business men it appears to be the prevailing opinion that it is only fair to the transportation companies that they should be permitted to increase their freight rates in proportion to the increase of other lines of business.

(2) Our people seem favorable for leaving for future consideration such individual rate adjustments as may be made necessary by the increase and also leaving for future consideration, as Congress may see fit to deal with it, the question of National regulation of railway securities.

Mayor of Mount Pleasant. (Population 5,812.)

(1) Doubtless our business men would favor such increase from a sense of fairness, but they are much disturbed over the failure of the railroads to give our town a passenger train service.

Theodore Heysham, Secretary, Norristown Chamber of Commerce. (Population 27,875.)

At a meeting of the Board of Managers of the Norristown Chamber of Commerce, held on January 26th, the matter of permitting the railroads to increase their freight rates in the manner indicated in their recent petition to the Interstate Commerce Commission, was considered, and it was on motion ordered that the proposed advance be recommended for endorsement at the next regular meeting of the Chamber of Commerce in February. This recommendation, I think, will be respected by the body and unanimously endorsed.

H. B. Miller, Burgess of North Braddock. (Population 11,824.)

(1) Yes. If my constituents were called to a mass meeting and this subject presented to them and truthfully explained by one they had confidence in, their answer would be as above, Yes.

(2) Yes.

Secretary, Ira L. Wales, Oil City Chamber of Commerce. (Population 15,657.)

At a meeting of the Board of Directors of this organization, held on January 6, 1914, it was moved, seconded and carried that the sentiment of the Board favored the Interstate Commerce Commission granting the application of the railroads for a five per cent increase in freight rates, and that if necessary, a representative of the Chamber of Commerce would go to Washington to testify to that effect.

Mayor Rudolph Blankenburg of Philadelphia. (Population 1,549,008.)

(1) Yes! The high cost of living affects railroad companies not only in increased expenses for materials, but also in increased payrolls.

(2) The increase in freight rates should be granted promptly. This is not an academic question, but one of sound business sense.

Secretary, Wm. R. Tucker, Philadelphia Board of Trade.

The following abstract is from the proceedings of a meeting held by the Philadelphia Board of Trade on May 19, 1913, during which the attitude of the Board in relation to the proposed five per cent increase in freight rates was recorded:

The railroads covering the Eastern Trunk Line territory have filed an appeal with the Interstate Commerce Commission for permission to advance freight rates five per cent. This territory produces an annual freight revenue of about $800,000,000, so that an increase of five per cent would mean an increased revenue to the railroads of about $40,000,000.

President Rea, of the Pennsylvania Railroad, in an open letter, claims that on that system east of Pittsburgh new legislation in five and a half years has cost his company $11,000,000; that the New Jersey grade crossing law will cost his company, in that State alone, $60,000,000; whilst full crew laws, railroad valuation laws, etc., will cost untold millions more.

Other railroad systems have been similarly affected in proportion to their extent.

Engineers and firemen have had their wages raised; conductors and trainmen are demanding increased pay; the public demands safety appliances and improved facilities with comforts and conveniences; all of which become added costs to the railroads but unproductive in the way of revenue.

Legislation and prosecution by the Federal Government, and legislation and prosecutions by the various State Governments, do not diminish, and it is becoming apparent that the natural timidity of capital is being affected by all these things in combination, and that world-wide investors are drawing their purse strings to see what will happen.

The letter of Mr. Rea breathes such a spirit of tolerance, along with acquiescence in and intended obedience to law, as induces a suggestion that all members of our Board should give it careful reading and consideration. It should further be borne in mind that the great railroad systems of this country are such tremendous consumers of mill, foundry and factory productions that when their purchasing power is reduced it reacts on the people, curtails employment, reduces consumption, thus affecting the masses and those least able to bear it.

On the other side of increased freight rates is the question as to what effect it may have on particular sections or on particular commodities, and to what extent some railroads have been improvidently capitalized and imprudently managed and so not rightfully entitled to the relief an increased earning power would bring.

Your committee is of the belief that the conditions of the transportation systems of the country must be put into shape to handle freely and promptly the trade and commerce of the nation; that the prosperity of the people is absolutely dependent on the prosperity and ability of the transportation companies to care for them and their business; and your committee, therefore, believing that the greater good will inure to the greater number, by permitting the railroads to increase their rates on freights to the extent of five per cent, recommends that the executive officers of the Board of Trade be empowered to address the Interstate Commerce Commission to the effect that they see no reason for objecting to such advance.

Secretary, Emil P. Albrecht, Philadelphia Bourse.

As other organizations whose membership coincides very largely with the stockholders of the Bourse, no action has been taken by our organization with respect to the proposed advance in freight rates, as we have felt that it was not necessary to duplicate the work of other organizations of this city, such as the Chamber of Commerce and the Board of Trade, along these lines.

Secretary, N. B. Kelly, Philadelphia Chamber of Commerce.

The following resolutions have been passed in November, 1913, by the Philadelphia Chamber of Commerce relative to the proposed increase of freight rates in Official Classification territory:

Resolved, That the Philadelphia Chamber of Commerce realizes that it is of the utmost importance to the business interests of our country that the railroad companies should be allowed to make charges which will permit of proper maintenance and extensions and provide adequate return on invested capital.

Secretary, Logan McKee, Pittsburgh Chamber of Commerce. (Population 533,509.)

The following resolutions with reference to the proposed increase in freight rates in Official Classification territory were passed by the Pittsburgh Chamber of Commerce on June 12, 1913:

Whereas, The railroads in what is known as the Official Classification Territory have requested from the Interstate Commerce Commission permission to advance their freight rates five per cent, and

Whereas, The railroads interested claim that they are not now receiving sufficient revenue to enable them under present conditions to perform service adequate to the needs of the commerce of the country, therefore

Be It Resolved, That the Chamber of Commerce of Pittsburgh hereby suggests to the Interstate Commerce Commission that they grant the railroads within the Official Classification Territory permission to advance freight rates, upon presentation by representatives of the railroads of the facts and figures which will prove conclusively the necessity of such increase in revenue, in order to provide adequate service and equipment to the shipping public, and, further

Be It Resolved, That the Chamber of Commerce of Pittsburgh respectfully calls attention to the contention of the Pittsburgh shippers that the prevailing rates on coal, coke and ore shipped into and out of the Pittsburgh District are unreasonable and excessive as compared with other districts and urges that a thorough investigation of the rates on these commodities be made following which rates on these commodities be fixed fair alike to the railroads and the shippers.

E. T. Messick, Secretary, Merchants' Protective Association of Pottstown. (Population 15,599.)

The following resolution has been passed by the Merchants' Protective Association relative to the proposed increase of freight rates in Official Classification territory:

Resolved, That the Merchants' Protective Association of Pittston, Pa., records itself as in favor of the application of the railroads for a reasonable increase in freight rates; that in our opinion such increase is necessary on account of business conditions and increased cost of operation, and that it is advisable because it will result in better railroad accommodations, more railroad construction and safer transportation; and that the Secretary be directed to communicate this Resolution to our Congressman and to the Hon. E. F. Clark, Chairman, Interstate Commerce Commission.

Albert P. Rodems, Burgess of Rankin. (Population 6,042.)

(1) The sentiment of the business men of this borough is in favor of granting the carriers in Official Classification territory an increase of five per cent in their freight rates.

(2) Public sentiment desires it to be promptly granted. In case of favorable action by the Commission, the business men of this vicinity are of the opinion that the railroads would increase their rolling stock, etc., which would be of great benefit to this immediate locality.

E. M. Campbell, Chief Burgess of Ridgway. (Population 5,408.)

(1) Yes, owing to increase of wages, demands for better equipment, grade crossings, etc., the five per cent increase is a just request. It is the opinion of the business men of this community that it would be a great stimulus to trade.

(2) The sooner the better for both railroads and business.

Secretary, Sharon Civic Association. (Population 15,270.)

The following resolution regarding the petition of the railroads in Official Classification territory to increase their freight rates five per cent, has been passed by the National Civic Association:

Resolved, That the Sharon Civic Association is heartily in favor of favorable action by the Interstate Commerce Commission on the application of the railroads of the Central and Eastern Classification Territory for an increase of rates, and we believe it would be advantageous to the country if such favorable action could be taken with the least possible delay.

We believe the proposed advances are justified and are necessary, in order to provide sufficient revenues for the proper maintenance of and additions to tracks and equipment to the end that the railroads may be sufficiently and properly equipped to render better service to meet the increasing demands of commerce in a manner that is now impossible, and to safeguard human life of both passengers and employes, and to enable them to maintain, if possible, the rates of compensation to their employes which have so materially advanced in recent years.

That the Secretary of this Association be instructed to forward a copy of this resolution to our Representative in Congress, to the Senator from the Western end of the State and Mr. E. E. Clark, Chairman of the Interstate Commerce Commission.

L. L. Anderson, Secretary, Sharon Retail Merchants' Exchange. (Population 15,270.)

At the regular meeting of the Retail Merchants' Exchange, held on January 17th, your communication was read and the Exchange reported as being favorable to the increase of railway rates.

Mayor Fred Wigfield, Chief Burgess of Steelton. (Population 14,246.)

(1) I have made a brief canvass of the most important business men of our town and all but one have expressed their desire that the increase should be granted on the grounds that certain laws have increased the expenses of the carriers.

William G. Gordon, Chairman, Transportation Committee, Swissvale Board of Trade. (Population 7,381.)

Your letter was referred to the Transportation Committee of the Board of Trade for reply and as there will not be a meeting of the Board of Trade for some weeks I would inform you that the committee is unanimously of the opinion that the advance should be granted as we think the depression in our local industries is largely due to the inability of the railroads to buy needed material.

Burgess, Titusville. (Population 8,533.)

(1) It is my belief that the sentiment of the business men of our city is in favor of

granting the carriers in Official Classification territory an increase of five per cent in their freight rates. However, I cannot make this statement officially, but I can say that the writer is heartily in favor of permitting this advance.

(2) Yes.

Secretary, Union City Chamber of Commerce. (Population 3,684.)

The following resolution, passed by the Chamber of Commerce of Union City, indicates the attitude of its members towards the proposed increase of five per cent in freight rates:

> Resolved, That the Union City Chamber of Commerce records itself as in favor of the application of the railroads for a reasonable increase of freight rates; that in our opinion such increase is necessary on account of business conditions and increased cost of operation, and that it is advisable because it will result in better railroad accommodations, more railroad construction and safer transportation; and that the Secretary be directed to communicate this Resolution to our Congressman and to the Hon. E. E. Clark, Chairman, Interstate Commerce Commission.

J. H. Ottaway,
Secretary.

R. D. Warman, Burgess of Uniontown. (Population 13,344.)

(1) It is the hope of our people that the increase of five per cent will be granted. Railway prosperity will increase our country's business.

Mayor C. S. Knobb of Warren. (Population 11,080.)

(1) Practically all parties that I have met and discussed this matter with, are in favor of the five per cent increase.

(2) Yes.

REPLIES OF AN UNFAVORABLE CHARACTER.

Mayor Spencer M. DeGolies of Bradford. (Population 14,544.)

(1) I believe the Interstate Commerce Commission is a body duly constituted to take charge of this question and that they can, and will do so, to the best interests of the country. As for our merchants, I may not speak with authority for them, but I think that as a whole, they are of the opinion that rates are higher now than they ought to be.

Hobart Callahan, Chief Burgess of Clearfield. (Population 6,851.)

(1) I do not think that there should be any increase in freight rates.

Mayor of Easton. (Population 28,523.)

(1) No.

Mayor of Greenville. (Population 5,909.)

(1) No.

H. M. Stokes, Burgess, Hanover. (Population 7,057.)

(1) The sentiment here is divided with the majority against granting the increase.

D. G. Crawford, Secretary, Homestead Business Men's Association. (Population 18,713.)

Our Association has gone on record protesting against the increase of five per cent in freight rates.

Mayor of Johnstown. (Population 55,482.)

(1) No.

Frank R. Diehl, Secretary, Lehighton Business Men's Board of Trade. (Population 5,316.)

On January 23d, the members of this Board passed a resolution opposing the proposed advance of freight rates.

Mayor of Lockhaven. (Population 7,772.)

(1) No; our business men do not want an increase in railway rates.

Mayor of Mount Carmel. (Population 17,532.)

(1) No.

(2) No.

E. H. Ward, Burgess, New Brighton. (Population 8,329.)

A number of our manufacturers and merchants with but one exception have in conversation with me expressed the opinion that they consider the present rate for this valley high enough considering the service rendered.

Mayor of Northampton. (Population 8,729.)

(1) I believe I am expressing the sentiment of our business men and corporations in this community, when I say they are not in favor of an increase in freight rates.

Mayor of Shamokin. (Population 19,588.)

(1) No.

Mayor of Tamaqua. (Population 9,462.)

(1) No.

Jacob Miller, Burgess of Wilkes-Barre. (Population 67,105.)

(1) To the above question, my answer is no, and I think this expresses the general sentiment in our neighborhood.

REPLIES INDICATING UNCERTAINTY OR DIVIDED OPINION.

Secretary, Wm. J. Fink, Bethlehem Industrial Commission. (Population 12,837.)

No action has been taken by this organization for or against the five per cent increase in freight rates in Official Classification territory.

Secretary, George L. Dobie, Bradford Board of Trade. (Population 14,544.)

No action has been taken by this Board of Trade for or against the five per cent increase in freight rates in Official Classification territory.

Secretary, Alford A. Wood, Butler Business Men's Association. (Population 20,728.)

No action has been taken by this Association for or against the five per cent increase in freight rates in Official Classification territory.

Secretary, C. N. Berntheizel, Columbia Merchants' and Manufacturers' Association. (Population 11,454.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Mayor, East Pittsburgh. (Population 5,615.)

(1) The small business men in our community do not favor the increase because of the necessity of increasing the selling price, which will put them to still greater disadvantage with the large stores of the city of Pittsburgh. The large manufacturing industries of our community do not seem to be antagonistic to the proposition.

(2) If the increase is to be granted, at all, I believe the sentiment would be to grant it promptly and allow details to be worked out later.

Secretary, A. M. Howes, Erie Retail Merchants' Association. (Population 66,525.)

No action has been taken by this Association for or against the five per cent increase in freight rates in Official Classification territory.

M. J. Boyle, Secretary, Freeland Board of Trade. (Population 6,197.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

John H. Royal, Mayor, Harrisburg. (Population 64,186.)

(1) So far as I know there has never been any public expression through the newspapers on freight rates being increased and I am therefore unable to answer your questions.

Secretary, Chas. E. Dasher, Asst. Secy., Harrisburg Board of Trade.

No action has been taken by this Board of Trade for or against the five per cent increase in freight rates in Official Classification territory.

Secretary, W. L. Stewart, Johnstown Chamber of Commerce. (Population 55,482.)

No action has been taken by this Association for or against the five per cent increase in Official Classification territory, in freight rates.

Secretary, C. H. Wanless, Lancaster Chamber of Commerce. (Population 47,227.)

No action has been taken by the Chamber of Commerce for or against the five per cent increase in freight rates in Official Classification territory.

Secretary, Wm. P. Hoppins, Lockhaven Board of Trade. (Population 7,772.)

No action has been taken by this Board of Trade for or against the five per cent increase in freight rates in Official Classification territory.

George P. Hancock, Chief Burgess, Mount Carmel. (Population 17,532.)

(1) Your request has been referred to the Merchants' Association.

Chairman, Wm. H. Garver, Transportation Committee, Manufacturers' Association, New Brighton. (Population 8,329.)

No action has been taken by this Association for or against the five per cent increase in freight rates in Official Classification territory.

Secretary, R. McWhite, New Castle Board of Trade. (Population 36,280.)

No action has been taken by this Board of Trade for or against the five per cent increase in freight rates in Official Classification territory.

Secretary, F. E. Marshall, Philadelphia Commercial Exchange. (Population 1,549,008.)

The following quotation from the annual report of the Transportation Committee of the Commercial Exchange of Philadelphia expresses the attitude of that organization regarding the proposed increase of five per cent in Official Classification territory:

"No action has been recommended by your committee upon the general question of the application by the carriers to the Interstate Commerce Commission for an advance of five per cent in freight rates, your committee believing that the carriers are able to justify their demand for higher rates, the Commission will not deny them."

Secretary, C. W. Summerfield, Philadelphia Merchants' and Manufacturers' Association.

No action has been taken by this Association for or against the five per cent increase in freight rates in Official Classification territory.

Secretary, William P. Young, Pottstown Commercial League. (Population 15,599.)

No action has been taken by the League for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, D. J. McDermott, Reading Board of Trade. (Population 96,071.)

No action has been taken by the Reading Board of Trade for or against the five per cent increase in freight rates in Official Classification territory.

Secretary, Mark K. Edgar, Scranton Board of Trade. (Population 129,867.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, Fred F. Bennett, Washington Board of Trade. (Population 18,778.)

While personally in favor of the increase, it has not been approved officially by our organization. I believe the railroads should endeavor to work in harmony with the Interstate Commerce Commission and that they should recognize they are quasi public corporations existing by reason of public franchise and paid by the public.

Secretary, A. G. Potter, Waynesboro Board of Trade. (Population 7,199.)

No action has been taken by this Board of Trade for or against the five per cent increase in freight rates in Official Classification territory.

Secretary, R. W. Ferrel, Wilkes-Barre Chamber of Commerce. (Population 67,105.)

No action has been taken by this Chamber of Commerce for or against the five per cent increase in freight rates in Official Classification territory.

PENNSYLVANIA EDITORIAL COMMENT.

Altoona (Pa.) Times, November 14, 1913.

It cannot be that those who oppose higher rates believe that the wages of railroad employes should be reduced. Yet during the year 1912, the railroads paid for labor 44.17 per cent of their total revenue, thus taking out of their earnings a large slice which is more likely to increase than decrease.

During 1912 the railroads paid for fuel and oil 8.93 per cent and for materials and supplies 14.06 per cent of their total gross earnings. Shall the reduction be made here? Could reductions be made in the prices of the materials used by the railroads, and still have the manufacturers of those materials uphold their present wage scale? In addition to the 44.17 per cent paid direct to labor by railroads, we find here another 22.99 per cent, in which a large portion is labor cost. In the cost of oil and fuel, for example, the price of labor represents 70 per cent of its value.

For loss and damages the railroads paid 2.20 per cent of their earnings during 1912. Possibly a reduction in this might be brought about, but to do so would mean that accidents must be prevented and the prevention of accidents means a still further outlay for improved equipment.

During 1912 taxes consumed 4.21 per cent of railroad earnings. Shall a reduction be made in this item? Will even the enemies of the railroads suggest that their taxes be reduced?

These items make up a total of 73.57 per cent of the gross earnings and are expended for operating expenses and taxes.

The balance of the earnings is divided for betterments, 3.75 per cent; dividends, 4.84 per cent; rents of leased roads, 4.41 per cent and interest on funded debt, 13.43 per cent.

If a reduction is made in the cost of betterments, it is up to the Commission or somebody else to show how the increased demands upon the transportation lines may be met at less cost than at present. If dividends are reduced, it must be shown who will invest in railroads the capital necessary to maintain them. Rents for leased roads might be cut by buying the roads, but who will furnish the money to pay interest? Interest on the funded debt can be cut by reducing the debt, but where will they get the money to reduce the debt?

Perhaps there may be a good reason for prohibiting an advance of freight rates, but there are few who will deny that the railroads require more money in order to carry on their work, or must effect a great saving in some of their present expenses. It is only fair that those who oppose the advance of five per cent asked by the railroads show how the desired result may be accomplished in some other manner.

Beaver Falls (Pa.) Tribune, December 19, 1913.

While the companies have largely increased their revenues in recent years, their expenditures have grown so much faster that net operating income of 1913 was actually less by over $16,000,000 than it was in 1910, notwithstanding that in the intervening period the railroads had put more than $650,000,000 of new money into their properties.

It is unnecessary to point out what will be the consequence if such a course is persisted in for any considerable time. First will come a reduction or suspension of dividends, so affecting the credit of the companies that it will be impossible to raise the money desired for improvements and after that will come bankruptcy. This is a contingency that cannot be viewed with equanimity and the mere possibility of it ought to give weight to a popular demand that the railroads shall be treated with the same degree of fairness to which every one, large or small, is entitled.

Bradford (Pa.) Era, September 22, 1913.

The conservative citizen must reach the conclusion that it is better for the people to be safe than sorry; that it is preferable to have an assurance of good service rather than to stand in danger of a transportation breakdown. There are strong evidences that if present ability of the roads to handle a rapidly increasing freight business is to be maintained, there must be extensive additions made to their equipment, entailing an enormous outlay for new motive power and rolling stock, improved equipment, track extension and an increased payroll.

Steam railroads in 1912, it is well known, had the smallest listings of new securities in ten years, while non-railroad corporations had the largest. Realizing this, the practical condition of declining credit cannot be disputed. Many of the prominent business organizations of the country have passed resolutions favoring or deciding not to oppose higher freight rates by means of which the Eastern roads will be enabled to provide a better and more adequate service. There is a strongly apparent need for increased railroad transportation facilities, and the shipping public should be willing to pay what is legitimately necessary to obtain them. A prominent business man of St. Louis voices a logical sentiment when he declares that "thousands of shippers have come to realize that their business is prosperous only when the railroads are prosperous and any slight increase in freight rates which they might have to pay would soon be lost sight of in the enormous increase in the profits of their business which this general prosperity would bring about."

Harrisburg (Pa.) Star Independent, January 20, 1914.

The railroads have long deferred contemplated expansions of their lines, the purchase of new equipment beyond their actual hand-to-mouth requirements and the making of repairs save those which are absolutely necessary. This has been because they have not been able to float new bond issues to provide funds for such developments except at rates of interest which are almost prohibitory.

If the five per cent increase in freight rates that is asked for, be granted by the Interstate Commerce Commission, it would increase the railroads' net earnings, which naturally would make railroad securities more attractive to investors. The result of this, it is logical to assume, would be that the market for railroad securities would be improved and that the railroads would be able to sell new stocks and bonds at interest rates lower than they now are compelled to offer. In other words the railroads with five per cent more revenue from their freight hauling should be able to show investors that railroad securities are commensurably improved as mediums for investment and thus obtain the money for the long delayed extensions and betterments. * * *

The railroads will be ready to make the repairs and replacements and also extensions as soon as they can get the money at reasonable rates, and a tremendous amount of the back work has accumulated. When the railroads begin letting the contracts for these things, it will mean a wonderful amount of business for the car builders, locomotive manufacturers, bridge constructors, rail makers and scores of allied industries. In fact, as Mr. Coombs has said when the railroads begin an aggressive campaign of expenditures for improvements and betterments, everything else is likely to start to boom in manufacturing and business circles.

Let's give the railroads that five per cent increase.

Johnstown (Pa.) Leader, May, 1913.

The argument of the railroads is a sound one. The margin between income and outgo is now so very narrow that the least unexpected occurrence, such as the recent Western floods or a bad accident, is liable to turn the balance on the wrong side of the ledger.

Lancaster (Pa.) New Era, January 26, 1914.

The proposed increase of five per cent on freight charges is too small to affect the cost of the necessaries of life. The consumer is not going to feel the effect of an increase of a few cents on every ton of freight, and the railroads argue, with a show of justice, that the additional revenue they would receive if they were permitted to put up their charges to the amount indicated, would help to restore their credit and thus aid in improving the general business of the country.

Oil City (Pa.) Derrick, December 5, 1913.

The reports show there is little trouble in holding gross earnings to a high level, the good business of the country in recent years favoring such receipts, but it is difficult to save any part of the gross return for net improvements. All the gain in gross is swallowed up by a larger expense account, much of which has been created by recent legislation. It seems reasonable to assume that the roads are in need of the five per cent increase in freight rates asked for and that it would be recognized by the Interstate Commerce Commission that failure to obtain them would result in hardship to many important railroad systems.

Philadelphia Bulletin, May, 1913.

It is to be recognized that the general railroad business of the country is not in a condition to stand further increases of expenses without being granted a right to additional earning power.

Philadelphia Bulletin, November, 1913.

If the increase in the cost of individual living is sufficient justification for the addition of seven per cent to the wages of the railroad conductors and trainmen, logically the increase in the cost of railroad living is justification for the advance of their earning power through passenger and freight rates. The Board of Arbitration on the trainmen's demands recognizes the fact that a ton of freight in Eastern territory is moved more than three miles for the value of a two-cent stamp, which is the cheapest railroad service to be found on the face of the globe, but it ignores that fact in its recommendations, because it is forced to admit that labor couldn't live on wages based on that rate. Obviously, if existing freight rates are not adequate to provide a living wage for labor, they cannot provide living income for the railroad operators.

But the Board of Arbitration "passes the buck." The question of rates, the problem of the railroad's living, belongs to the Interstate Commerce Commission, which stands as a challenger of every proposed increase of rates, suspends the new schedules for six months and employs Mr. Brandeis to use whatever resource may be at his command to controvert the railroad's plea. The finding of the Board of Arbitration is binding on the roads, and it ought not only to be accepted without challenge by the Interstate Commerce Commission but it should prompt them to immediate action on the rate advances. The increased wage schedule is retroactive and dates from the first of October, but the increase in rates which is to provide for these additional wages must wait the pleasure of the Interstate Commerce Commission and its proposed muck-raking investigation.

Philadelphia Bulletin, January 21, 1914.

Monday, the Commission made public its official report of the operating income and expenditures of the railroads of the country for the month of November, showing not only an increase in operating expenditure, but a decrease in operating revenue and fully confirming all that had been asserted by the railroads in the original presentation of their case, which had been otherwise confirmed and corroborated in arguments and briefs presented to the Commission.

But, in spite of the fact that all this information is, and has been, in the possession of the Commission, there has just been sent out to the petitioning railroads, the revised Brandeis catechism, shortened and simplified it is said, and yet calling for complications which it is admitted by the Commission will require the greater part of a month to complete, and an indefinite time thereafter to digest and to apply to the problem before them.

Granting the desire of the Commission to "expedite" its proceedings it appears that the middle of March, or nearly six months after the railroads formally presented their case of need, will be the earliest possible date of decree. In the meantime the busiest season of the railroads will have passed, nearly a half year's business will have been hauled at inadequate rates, losses will have been sustained that will not be made up in the balance of the year. If government regulation is to be of practical service it must develop greater efficiency than this. When the arbitrators on wage increases, acting under semi-official sanction, made their recommendation of higher wages, their decree was retroactive. The railroads do not ask for such a privilege in the application of their new freight schedules, but if they are entitled justly to their increase, it should be granted with reasonable promptitude.

Philadelphia (Pa.) Evening Star, November 20, 1913.

It must be very clear that the railroads cannot go on increasing their cost of operation in this way, running their expenses up millions on millions, without having some slight increase in their revenues to meet the drain. The increase in rates asked, five per cent, is very small considering all this and there ought to be a sense of fair dealing in the Interstate Commerce Commission which will perceive this point.

The railroads have been baited on all sides for many years and the time has come when this must cease and when there must be applied to the situation some plain common sense and some fair play else there will be a series of calamities which will involve far more than the railroads and which will be very disastrous to the entire country.

Philadelphia (Pa.) Evening Telegraph, November 26, 1913.

As long as rates remain what they have been and expenses mount higher almost steadily the roads must suffer. There is no authority that can put a stop to the increased expenses as there is authority to halt an increase in rates. It is not necessary to go into details, but the returns of single roads and of a group of roads show that gross earnings have not maintained anything like the percentage to expenses that would enable them to keep pace with the natural demands of the country.

The railroads are an important part of the material prosperity of the country. The prejudice that existed against them for an occasional abuse of privilege has largely disappeared since they were brought under Government regulation. The fact that there is practically no popular opposition to the present request for a moderate increase in freight rates plainly shows that all that is desired is that the railroads shall have fair treatment.

It is to the public interest that they shall have—that there shall be a mutual understanding—for upon just treatment and the reasonable prosperity of the railroads depend in large degree the prosperity of the country itself.

Philadelphia (Pa.) Evening Telegraph, January 13, 1914.

The Interstate Commerce Commission has been deferring for many months its decision on the application of Eastern railroads for an increase of five per cent in their freight rates; and now when a decision is looked for a new set of questions has been sent out to answer which will require months more time, if indeed some of them can be answered at all.

Doubtless a matter of so much importance as this requires time for proper consideration. But the Commission has had time. The conditions should not call for much in the way of new information for a Commission whose continual business it is to know all the ins and outs of the railroad situation at all times. If it had the records and the knowledge that should be kept on hand it would know without a very great deal of argument, in addition, whether the claim for a slight increase in rates is a reasonable one or not.

The question ought to be decided without further delay. To continue holding it up is an injustice to the railroads. Their operations must be more or less hesitating while the uncertainty exists, and in some respects an adverse decision would probably be less disadvantageous than to have the matter hanging on in uncertainty. It is the uncertainty that kills. Delay also will endanger the credit and position of the Commission.

Philadelphia (Pa.) Telegraph, January 29, 1914.

There has been a general feeling that much of the business depression that has been felt for several months was due in considerable degree to the fact that the railroads had restricted their operations owing to decreased net earnings. They have looked forward to an increase in rates to restore activity and quicken the pulse of business. The application for the increase has been before the Commission for four months, and this latest announcement makes it very uncertain when the matter will be determined.

This is a disadvantage to the public as well as to the railroads. The question—like all questions that affect business—should be decided one way or the other with reasonable promptness. Nothing can be expected to go right when a cloud of uncertainty hangs over it.

Philadelphia (Pa.) Evening Times, November 24, 1913.

If railway revenues are to go on being eaten up by dearer labor, dearer fuel, dearer supplies and equipment of all kinds, it is only a question of time till there won't be left from that devouring process any revenues to go into the improvement of existing facilities and the creation of new ones. The money will not be earned to do this, and it can't be borrowed to do it; for it's as simple a proposition as A B C that no capital will back a thing to do more business when the more it does the worse off it is.

It will be a mighty serious thing for railway capital, railway labor and the public when the common carriers can no longer keep up with the transportation needs of the country; it will even be a serious thing for them not to be able to keep ahead of the transportation needs of the country, as they have done in the past.

Philadelphia Inquirer, May, 1913.

They cannot furnish the kind of accommodation the public wants and ought to have unless they are afforded an opportunity to provide themselves with the means.

Philadelphia (Pa.) Inquirer, November 24, 1913.

Some people argue that the increases in wages just granted the railroad employes should be paid out of surplus earnings, or, if necessary, by reducing dividends. The borrowing power of a railroad is determined by its ability to earn dividends. To-day the railroads paying the highest dividends are experiencing the greatest difficulty in borrowing money to make needed improvements, for the simple reason that between 1908 and 1911, the railroads as a whole increased their capital investments 2,000 million dollars, whereas during the same period their surplus, after payment of operating expenses, actually decreased eight and three-quarters millions. Daniel Willard, president of the Baltimore and Ohio, recently pointed out that during the past three years his company had spent $55,000,000 for improvements, whereas net income for the fiscal year ended June 30th last was $751,000 smaller than it was for 1910.

Those figures are not based on theory, but existing conditions, the railroad president said, and it is added that if the public wants improved railroad facilities it must permit the railroads to earn enough to attract the new capital needed.

Philadelphia (Pa.) Inquirer, November 26, 1913.

Many, if not most of the shippers' organizations, have admitted the justice of the railroads' plea and have even asked that the advance be authorized, but it is certainly the business of the shippers to prove, if they so desire and are so able, that the existing rates are adequate, and it is as certainly not the business of the Commission to employ counsel to make or attempt to make this demonstration.

The Interstate Commission was not endowed with the powers which it possesses, powers which are unparalleled in their magnitude, for the purpose of antagonizing the railroads and of making it impossible for them to earn a reasonable profit. Those powers were conferred upon it for the purpose of promoting the welfare of the public and of the railroads alike. They were to be used to secure for the community an efficient service at a reasonable cost and to save the railroads from the secret rebates and from the rate wars which at one time brought so many of them to bankruptcy. Even those by whom the Commission was originally opposed are ready to acknowledge now that the effect of its operations has been beneficial and would be sorry to see any restoration of the conditions which the Commission brought to an end. But it is the duty of the Commission to administer justice and to refrain from partisanship of any kind or sort. Should it fail to do this, it would become an oppressive and intolerable tyranny.

Philadelphia (Pa.) Inquirer, January 22, 1913.

Why all this delay?

Months have already elapsed since the first application was made. The Commission has demanded an immense amount of statistical information which can be of no possible use to it in deciding what is after all a broad principle. The membership of the Commission includes men of practical experience. It is not a court governed by any ancient laws of procedure. It is composed mostly of laymen who are supposed to have common sense, to be able to see things before their eyes.

Whether or no the railways deserve a five per cent increase in freight rates is not to be settled by figures in camera. Every sensible person knows that the railway industry has been suffering through many months' lack of income, that because of this lack of net income it is impossible to borrow money for needed improvements, extensions and betterments. The railways say that they can get the money and start a thousand industries if their requests are granted. The bankers say the money can be forthcoming immediately. The manufacturers say they are waiting only for the grant to start up at high speed.

Could anything be simpler than that? Ought not men of common sense to be able to decide inside of a week whether these statements are true or false? The constant delay is an injustice to business and an injustice to the army of unemployed. It is unfair to postpone so momentous a decision. Any private business would go to ruin quickly under such management.

And what do the railways ask?

They ask the enormous increase in rates of one cent for carrying a ton of freight twenty to thirty miles. That is all. Can anyone believe that this will injure any individual or industry? The Commission probably knows very well at present what it will do. It ought to have given its decision months ago.

Philadelphia Public Ledger, May, 1913.

The whole country rises and falls with the railroads. When roads earn great sums they spend the money in countless ways. The steel mill, the nail factory, the locomotive works, the car builder, the coal mine, the timber owner, the contractor, all feel the effects instantly. Prosperity of the roads carries immediately good cheer to millions of workers who are not employed by them. When the railroads are poverty-stricken, and curtail their outlay, every other industry in America feels the jolt. And they must curtail them when the margin over necessary expenses dwindles to near the zero point. It is impossible for the railroads to keep on increasing wages and other expenditures without also increasing income.

Philadelphia Public Ledger, May, 1913.

"More people are affected directly by an award of the Interstate Commerce Commission than by a decision of the United States Supreme Court. Thus when the railroads shall ask permission to increase freight rates five per cent the yes or no of the Commission may mean prosperity or hard times for many million people.

"This question of rates should be treated on the broadest possible scale. The country cannot afford to strangle or unnecessarily annoy its greatest single industry except agriculture. The welfare of the entire nation is so closely interwoven with the welfare of its tremendous railroad system that one cannot be hurt without as grievously wounding the other.

"No one can escape the conviction that in the past few years the railroads have been put into thumb screws. They have been forced to increase wages several times since the 1907 panic, so that to-day the railroads of the United States pay not only far greater wages than are paid in any other land, but much greater than were ever before paid in this country. Laws have been enacted which compel them to better their equipment and to safeguard their tracks. Public clamor has demanded the most lavish terminals—buildings that rival in splendor the best the world ever saw.

"In every possible direction have the roads been forced to expand and to spend more of their earnings. Wages, track and equipment, each and every one has cut more and more into revenue. The roads are powerless to increase passenger fares or freight rates. At the same time they are powerless to reduce expenses. The sequel is that while this country has been blessed by the most bountiful times ever witnessed, the railroads have not been able to share in it.

"Net profits earned on the outstanding capital stock do not rise. On the contrary, they are falling. If the stockholder were the only one to suffer the case would not be so serious.

"But the whole country rises and falls with the railroads. It has been so for half a century and is so to-day. When roads earn great sums they spend the money in countless ways. The steel mill, the nail factory, the locomotive works, the car builder, the coal mine, the timber owner, the contractor, all feel the effects instantly. Prosperity of the roads carries immediately good cheer to millions of workers who are not employed by them.

"When the railroads are poverty-stricken and curtail their outlay every other industry in America feels the jolt. And they must curtail them when the margin over necessary expenses dwindles too near the zero point. It is impossible for the railroads to keep on increasing wages and other expenditures without also increasing income. Bankruptcy would be the inevitable sequel.

"When the Interstate Commerce Commission takes up this freight rate request it is bound by every instinct of national welfare to consider it in the broadest possible way. The pastime of bullying railroads has ceased to be popular, because it is too dangerous. The Commission can do the country a very exalted service by dealing justly with the railroads without any unnecessary delay."

Philadelphia (Pa.) Public Ledger, January 8, 1914.

The Interstate Commerce Commission reports that the net operating revenue of 152 of the largest railroads of the country for the five months ending January 1st, showed a decrease of $39,000,000 as compared with the corresponding five months of the previous year.

The sixty-one roads in Eastern territory, which are demanding a five per cent increase in freight rates, showed an increase of about $4,500,000 in gross revenue, but this was more than taken up by an increase of nearly $31,000,000 in operating expenses.

The figures vindicate the urgency of the railroads' request. It will be time enough to discuss Government ownership when Government regulation has discountenanced popular hysteria against the roads to the extent of permitting them to be conducted on a sound financial basis.

Philadelphia (Pa.) Public Ledger, January 9, 1914.

Has the hour not arrived when the managers of big business and the operators of railroads should come forward with their own program of action? Has the day not passed when these men who are responsible for such stupendous enterprises can sit supinely while legislative and political machinery is in action in its efforts to dissolve and to curb?

The news from Washington outlines a new anti-trust program for Congress. Either this action is right or it is wrong. Either the trusts deserve to be cut into shreds or they deserve to be let alone. Either the railroads should wait for Mr. Brandeis to delve into the whole scheme of world-wide railroad operation before getting an advance in freight rates or they should not wait.

This question of ceaseless agitation involves all States and all the people in every one of them. It is not confined to the welfare of Wall Street. It is far greater than the interests of property owners, because it embraces every laborer as well as every employer.

The 188,000 freight cars now idle touch the interests of shipper, of consumer and of workmen as well as the interests of bond owners and stockholders. It is manifestly the very first duty of railroad managers to present their case, if they have one, and put it in such form that it may be heeded.

All who depend upon business—investors and workers—as well as Congress, should immediately frame a program of action and let the world know what they have to offer in contradiction to the plans of further assaults upon them.

Philadelphia Record, May, 1913.

The interests of the railroads and the public are really identical, for one cannot suffer serious losses without the other being greatly affected. The present situation calls for fair and just treatment of the railroads if future trouble is to be avoided.

Philadelphia Record, December 6, 1913.

The man of family who finds that his outgo is rising rapidly seeks to increase his income, either by enlarging his business, or securing an advance in salary, or taking on extra work, and if these expedients fail he proceeds to cut his expenses. So it is with the railroads. Their expenditures are steadily rising, because of the increased cost of material and fuel, higher wages for employes, public demands for improvements, etc., but they cannot secure a corresponding gain in income without governmental sanction. In foreign countries, where the State owns the railways, there has not been the slightest hesitation in raising rates to keep pace with the growing cost of operation. That must be done here, too, if the railroads are to continue efficient agencies. While everything else is going up in price there can be no justice in singling out this one class of corporations and saying that they alone must stick rigidly to the old rates, no matter what the consequences may be.

Pittsburgh (Pa.) Post, November 25, 1913.

As a matter of fact it must be apparent that if the prices of material and labor continue to increase there must be an increase in freight rates some time. It is quite certain that many roads have been able to operate without an increase only by skimping in the expense for upkeep. That will ultimately prove uneconomical because it is dangerous, leading to ineffective operation first and then to accidents.

Reading (Pa.) Eagle, November 25, 1913.

The Interstate Commerce Commission has begun hearing evidence on the application of the Eastern railways for permission to increase freight rates five per cent. In 1910 a similar application was made but for a ten per cent increase, which was refused. In the opinion of many impartial investigators, however, conditions have since changed, so that there are reasons which did not apply three years ago for granting the smaller increase now requested.

Not only have legitimate expenses increased and the railroads added to their investments and therefore to their interest charges in the last few years, but it is certain that they will have to make great additional expenditures in order to handle business in the next few years. Double tracks, safer signals, larger locomotives and cars, heavier rails and many other articles of new equipment must be purchased. These expenditures can only be met by bond and stock issues and the interest and dividend charges must come from increased rates.

Reading (Pa.) News, November 26, 1913.

It is generally admitted that the operating expenses of the companies have greatly increased, as they have been forced to advance the wages of their employes, and they are placed in the peculiar position of making a larger outgo without ability to increase their revenue by advancing charges to meet the new and extraordinary expense.

No fair-minded man would want to see the great railways permanently crippled and all the public will ask is that the Commission shall weigh the evidence justly and render a decision that will be fair to all the interests involved—those of the railways and those of the public.

Reading (Pa.) News, December 1, 1913.

It is hoped that the Commission will not be long in rendering a decision.

The uncertainty is unsettling not only to the railways themselves, but also to the iron and steel industry for the railway companies are holding back their orders for new material until they know whether the Commission will grant them authority to increase charges.

It is thus seen that what affects one industry affects another. Of course, the companies are putting on a "Long Face" in stating their side of the case before the Commission, but it does seem as if they would be seriously handicapped if they failed to get something from the Commission.

Scranton (Pa.) Times, May, 1913.

The corporations cannot meet transportation facilities demanded by the public, without the means to buy equipment, make extensions and meet needs, and while there has been an advance in rates in all other kinds of business, the railroads have met greatly increased expenses, without getting consequent revenues in return.

Scranton (Pa.) Times, November 25, 1913.

The railroads are in stress with increased costs in every line, without necessary revenues to meet the needs of maintenance. There is reason to hope the very moderate request of the railways will be granted.

Scranton (Pa.) Times, November 26, 1913.

The proposed general advance of five per cent in rates that this increase would afford, would only cause the slightest disturbance to the commercial world and would be of considerable benefit to the development of their properties. A leading railroad official estimates that the increase asked would add between $35,000,000 and $40,000,000 to the revenues of the fifty-two railroads involved.

Shamokin (Pa.) News, November 29, 1914.

It is generally admitted that the operating expenses of the companies have greatly increased, as they have been forced to advance the wages of their employes and they are placed in the peculiar position of making a larger outgo without ability to increase their revenue by advancing charges to meet the new and extraordinary expense.

No fair minded man would want to see the great railways permanently crippled and all the public will ask is, that the Commission shall weigh the evidence justly and render a decision that will be fair to all the interests involved—those of the railways and those of the public.

Altoona (Pa.) Gazette, November 25, 1913.

Nothing has done so much for this country as its railroads. Their development along all lines has never been equalled in the world. It should continue, and any course that would bring it to a halt would be a great deal more costly than the additional freight tolls the country will have to pay if the increase is granted.

All through this business there has been the usual disposition of Americans to go too far with a good thing. Regulation of the railroad corporations was badly needed, but persecution of them, which is what is meant by some of the laws placed on the statute books of this State in recent years, is a very bad thing. It is bound to be reflected in the progress of the roads, in the quality of their service, in the safety of their operation, and in many other ways.

Titusville (Pa.) Herald, May, 1913.

Something has to break somewhere. Without this advance the roads will find it increasingly difficult to provide the funds needed for maintenance and new equipment and at the same time continue to pay a fair return to stockholders in the shape of dividends upon their investment.

Williamsport (Pa.) Gazette-Bulletin, November 29, 1913.

The railroads are clearly entitled to revenues sufficient to make their stocks and bonds interesting to the investing public. The interests of the public are linked inseparably with those of the great transportation lines, and those who are opposed to granting the railroads the right to advance freight rates are enemies not so much the railroads as of the people.

Williamsport (Pa.) Bulletin, January 12, 1914.

Each of the fifteen thousand members of the Illinois Manufacturers' Association has received from the Board of Directors a communication urging him to "wire the President, wire your

Senators, wire your Representative to use their influence for a five per cent horizontal raise in freight rates in Official Classification Territory." They are requested to do this upon the ground that the authorization of the raise will "make business boom."

Other commercial bodies in different parts of the country have assumed the same attitude, but the action of the Illinois organization is especially significant because that body led the successful fight against the increase of rates for which permission was sought a little over three years ago. Its change of mind is the result of an exhaustive investigation which disclosed that the actual conditions are materially different from those existing in 1910. Owing to the increase of wages secured through an enforced arbitration, to the increase in taxes, to the additional expenditures imposed upon the railroads by legislation of the "full crew" type, etc., the net revenues of the railroad have been reduced to a point at which they are insufficient to provide for that degree of rehabilitation and extension of facilities which prompt an efficient service to the shippers' demand. * * *

The Kane (Pa.) Board of Trade also "favors the granting of the five per cent increase asked for by the railroads of the Eastern District." The Kane organization represents "seven thousand persons, whose shipments, inbound and outbound, average one thousand tons a day." This action is commendable, showing that the spirit of fair play, which is due the railroads as well as individuals, is strong with the people of Kane.

The resolution of the Illinois Association and that of the Kane Board are in harmony with the conclusions invariably reached by fair minded and intelligent men who give the matter due thought.

Burdens have been added until endurance has reached its limit. Plainly, adverse action by the Commission would be the last straw.

ILLINOIS.

REPLIES OF A FAVORABLE CHARACTER.

M. C. Chapman, President, Fox River Valley Manufacturers' Association of Aurora.

Our members are in favor of allowing the railway companies to increase their freight rates so far as the five per cent is concerned, but our Association has taken no official action thereon. While the majority of our members are heavy shippers they feel that the railway wage scale has advanced to a considerable extent in the last two to four years, in fact so much so that we think the railway companies are entitled to the increase,

Secretary, W. F. Vanderburgh, Cairo Commercial Club. (Population 14,548.)

The directors of the Commercial Club adopted the following resolutions on January 6, 1914, favoring the proposed advance of five per cent in freight rates provided same is made uniform and without discrimination:

Whereas, The railroads operating in so-called Official Classification Territory have filed a petition with the Interstate Commerce Commission, to the end that the carriers in said territory may be permitted to advance all interstate rates five per cent, and

Whereas, Said petition has been denied, and in lieu thereof the Commission will proceed under a general inquiry into the subject under investigation and suspension docket No. 333, and

Whereas, The Cairo Commercial Club in meeting assembled this 6th day of January, 1914, to consider and determine their attitude respecting the question which they recognize as of great importance to the members of the organization, the carriers and the public at large: now therefore be it

Resolved, That the attitude of this club is as follows—

That this organization is in sympathy with the plan of an advance of five per cent in above described territory, provided that such advance is general and uniform, and without discrimination, and be it further

Resolved, That a copy of these resolutions be furnished the Interstate Commerce Commission.

Mayor Fred Pullen of Centralia. (Population 9,680.)

(1) Yes; without question it should be done and our people are anxious about it.

(2) Yes; we feel that it should be done at once.

Mayor O. B. Dobbins, of Champaign. (Population 12,421.)

(1) I believe the sentiment in this city favors the increase as a relief to the general depression.

(2) If made, it should be promptly accomplished. The sentiment also is, I believe, that Congress should take charge of the regulation of railway securities at once.

Secretary, C. W. Murphy, Managing Secy., Champaign Chamber of Commerce.

Our Association has never taken formal action regarding the increase in freight rates. At a recent meeting the subject of increased rates was discussed and remarks by our members who spoke, indicated a desire to have rates by which carriers might conduct their business at a profit.

Traffic Director, Chicago Association of Commerce. (Population 2,185,283.)

The following resolutions regarding the proposed advance in freight rates in Official Classification territory were adopted November 9, 1913, by the Freight Traffic Committee of the Chicago Association of Commerce. A copy of other resolutions adopted by this committee on December 23, 1913, wherein the Commission is urged to expedite the investigation and hearings with all possible dispatch to the end that a speedy termination of the question may be reached, is also appended:

Resolutions Adopted by the Freight Traffic Committee of the Chicago Association of Commerce, at Their Meeting Held October 9, 1913, in Respect to the General Advance in Freight Rates in the So-Called Official Classification Territory.

Whereas, The railroads in the so-called Official Classification Territory filed a petition with the Interstate Commerce Commission to re-open the so-called General Rate Advance Case (heard and decided adversely to the carriers about two years ago) to the end the carriers in said territory be permitted to advance all interstate rates five per cent, and

Whereas, Said petition has been denied and in lieu thereof the Commission will proceed to a general inquiry into the subject, and

Whereas, The Freight Traffic Committee of the Chicago Association of Commerce has held many meetings to consider and determine their attitude respecting the question, which they recognize as of great importance to the members of the Association, the carriers, as well as the public at large; now therefore be it

Resolved, That the attitude of this Committee is as follows:

First. The Committee is in sympathy with the plan of having the question adjudicated by the Interstate Commerce Commission, that Body to determine from the facts the necessity for said proposed advance and the reasonableness of the rates to be established thereby. The Committee look upon this proposed advance in the ALL RAIL rates as experimental. If the benefits arising therefrom are mutual and of a permanent nature the increase may be justified. If, on the contrary, the results are not permanent and a request for another increase in rates follows, it will demonstrate that advances in rates do not meet the issues involved, nor provide a remedy for existing conditions.

Second, The Committee especially invites the Commission's attention to the fact that the movement towards higher transportation charges in Official Classification Territory has, in the past, fallen to an undue and unreasonable extent upon the RAIL-AND-LAKE RATES. If the claim of the carriers be conceded that increased cost of operation, taxes, and a return upon additional capital justifies some increase in ALL-RAIL interstate rates, we respectfully submit that such claim cannot and does not apply to the RAIL-AND-LAKE RATES, which have been advanced three times since 1900 (a total of approximately eleven per cent) without any change in the ALL-RAIL RATES, which fact not only debars the claim that a fixed relation exists between the ALL-RAIL and RAIL-AND-LAKE rates that requires them to be similarly changed, but establishes the further fact that traffic moving under these rates has already contributed in full measure to any reasonable advance. We therefore are irrevocably opposed to any advance in the present RAIL-AND-LAKE RATES. Be it further

Resolved, That a copy of this resolution be sent to the Interstate Commerce Commission.

Preamble and Resolutions Adopted by the Freight Traffic Committee of the Chicago Association of Commerce at Their Meeting Held in the City of Chicago, Tuesday, December 23, 1913.

Whereas, The Freight Traffic Committee of the Chicago Association of Commerce did on the 9th day of October, 1913, adopt certain resolutions touching upon the question of the pending investigation upon the part of the Interstate Commerce Commission into the proposed general advance of five per cent in freight rates in so-called Official Classification Territory, and

Whereas, Said Committee in their resolutions have not opposed, and do not oppose, the suggested advance in the all-rail interstate rates, and

Whereas, Long continued uncertainty as to the final outcome in the judgment of this Committee, will be detrimental to the commercial activities of the country, now therefore be it

Resolved, This Committee respectfully urge upon the Interstate Commerce Commission the propriety of causing all parties to the case to proceed with all possible dispatch to the end that a speedy determination of the question may be reached. Be it further

Resolved, That a copy of these resolutions be sent to the members of the Interstate Commerce Commission.

Secretary, J. C. Merrill, Chicago Board of Trade.

The following is a copy of resolutions passed on January 13, 1914, by the directors of the Chicago Board of Trade regarding the proposed increase in Official Classification territory:

The Transportation Committee unanimously recommends to the Honorable Board of Directors the adoption of the following resolution and its transmission to the Honorable Interstate Commerce Commission:

Whereas, This Committee recommend that the carriers be allowed a uniform advance of five per cent in rates for the purpose of furnishing increased transportation facilities and more adequate service, and

Whereas, The Honorable Board of Directors adopted such resolutions on November 25,1913, and transmitted same to the Honorable Interstate Commerce Commission; therefore be it

Resolved, That this Committee now recommend to the Honorable Board of Directors that it invite the attention of the Honorable Interstate Commerce Commission to the resolutions hereinbefore referred to and respectfully urge that a decision of the question be rendered at the earliest possible date, because the uncertainty has the effect of unsettling business, and an early determination of this question will remove the uncertainty and aid the resumption of normal business conditions.

General Secretary, National Business League of America, Chicago.

At a meeting held in Chicago on January 15, 1914, the National Business League of America adopted the following resolutions regarding the petition of the carriers in Eastern territory for an increase of five per cent in their freight rates:

Whereas, The Resolutions Committee of the National Business Congress, held under the auspices of the National Business League of America, in the platform adopted June 27, 1912, declared that 'sufficient and efficient transportation is necessary to the prosperity of the whole country' and 'depending upon transportation regulation as an established fact, we believe it important that in providing regulations due consideration be given to the question of securing transportation net earnings sufficient to meet all necessary costs of maintenance and operation, and to provide all facilities required by the growth of every community'; and

Whereas, We believe that the present net earnings of the railways are insufficient for the proper maintenance of equipment, extension of facilities, efficient service and safety of life and property; resulting also in the curtailment of purchases from dependent industries, which seriously cripples the general business of the country; therefore, be it

Resolved, By the Board of Directors of the National Business League of America, that, as a necessary measure, imperative to the prosperity of carrier, shipper, and business interests generally, an immediate uniform increase of not less than five per cent transportation rate be granted the railway interests; and be it further

Resolved, That copies of this preamble and resolution be presented to the members of the Interstate Commerce Commission and to the public press.

PHILETUS W. GATES,
President.
AUSTIN A. BURNHAM,
General Secretary.

Thomas F. Beuther, Secretary, Northwest Side Commercial Club of Chicago.

On February second the Executive Committee of this organization voted in favor of the increase in freight rates in the following manner:

> That Northwest Side Commercial Association go on record as favoring an increase of five per cent in freight charges to carriers as indicated in their recent petition to the Interstate Commerce Commission.

Mayor Dan Dinneen of Decatur. (Population 31,140.)

(1) While I am not aware that the matter has been discussed here to any extent, the people of Decatur are in favor of treating the railroads fairly and if it requires five per cent in freight rates to insure fair treatment, then tack it on.

(2) The request being just, it is believed it should be granted without delay.

Secretary, John M. Byrne, Decatur Chamber of Commerce.

Without making a particular investigation, I am of the opinion that the sentiment in Decatur generally favors fairness of attitude towards the railroads. If fairness means an increase in rates, Decatur business men will favor the increase. No resolutions have been passed by our Chamber of Commerce.

Mayor of Elgin. (Population 25,976.)

(1) The Elgin Commercial Club after a canvass of this situation among the manufacturing and mercantile interests, has officially endorsed the proposition to grant a five per cent increase to carriers in Official Classification territory.

(2) We believe it proper to leave the question of National regulation of railway securities to Congress.

Secretary, E. D. Howell, Elgin Commercial Club.

Acting under instructions from the Board of Control of this Association, though without passing formal resolutions, I have wired the President of the United States and the Congressmen from this district, advising them that we favored the advance in Official Classification territory.

Secretary, Freeport Chamber of Commerce. (Population 17,567.)

Our organization has passed no formal resolutions relative to the proposed increase in freight rates in Official Classification territory. However, as it is incumbent upon me to watch the rate situation here closely, I had occasion to ascertain how our people, including shippers both large and small, feel concerning this proposed increase of five per cent and so far I have found no one who had any serious objection to it. In fact, most of the largest manufacturers and shippers have signed a petition requesting the Interstate Commerce Commission to permit the suspended tariffs to go into effect.

We feel that to a certain extent the railroads have been getting more than their due the past few years in the way of criticism and adverse legislation, particularly in certain states, and while they are perhaps responsible for this themselves in view of their past misdeeds and lack of regard for public sentiment, we feel that inasmuch as the railroads are one of the most, if not the most, important factors in our commercial and industrial development, they should not be unduly restricted in their operations. If the granting of the proposed increase of five per cent to carriers in Official Classification territory will have the effect of strengthening the confidence of the investing public in the railroads and if it will permit them to finance their operations more readily, we believe that it will be an excellent thing for all concerned. Certainly curtailment of purchases by the railroads is not beneficial to business and neither is their policy to make no improvements or extensions under present conditions.

It is competitive rates that we are principally interested in and a five per cent increase in rates will hurt no one. It all comes back to the ultimate consumer anyway and such an increase as this would hardly be felt. We do not want you to assume from this statement that we do not think that careful consideration should be given to all proposed increases before they are permitted to go into effect, for we do, but the increase under consideration is, we think, perfectly proper and we are heartily in favor of it.

J. F. Berger, Secretary, Granite City Commercial Club. (Population 9,903.)

In reply to your letter of January 15th regarding the proposed increase of five per cent in freight rates, I desire to state that the Granite City Commercial Club has passed a resolution endorsing the increase and has wired President Wilson and both the United States Senators informing them of our action in the matter.

Secretary, C. E. Mitchell, Hoopeston Business Men's Association. (Population 4,698.)

We desire to state that we are in favor of an increase in freight rates.

Secretary, Illinois Manufacturing Association.

The following is from a letter sent by Secretary John M. Glenn, on January 6th, to the members of the Illinois Manufacturing Association:

"Wire the President, wire your Senators, wire your Representatives to use their influence for a five per cent horizontal raise in freight rates in Official Classification Territory.

"Do not suggest selfish exceptions as to lake and rail rates. Closed plants mean idleness and suffering to the entire country. With the industries shut down all business will be at a standstill.

"Act, and act promptly. The Interstate Commerce Commission should be impressed with the importance of a quick decision.

"At the regular monthly meeting of the directors of the Illinois Manufacturers' Association, January 2nd, a committee composed of Charles Piez, P. A. Peterson and John E. Wilder, after several months' investigation of railroad conditions throughout the country, reported the following resolutions, which were unanimously adopted:

"'Your committee has after thorough investigation, found that conditions with the railroads have changed materially since your Association successfully opposed the request for an advance in 1910. That the increase in wages granted through arbitration, the increase in taxes, the increased expenditure to insure safety to both the men and the public, and the increase caused by legislation of the full crew type have so increased the operating expenses of the railroads in general that the net revenues are insufficient to provide for that degree of rehabilitation and extension of facilities which prompt an efficient service to the shippers' demands.

"'Your committee is convinced that shippers can better afford to pay a uniform advance of five per cent than suffer in the future any impairment of railroad service.

"'Therefore the Illinois Manufacturers' Association, through its board of directors, declares itself in favor of granting the request for a uniform increase of five per cent of all rates in Official Classification Territory.

"'That this increase be applied not to further wage advances but to the rehabilitation and extension of facilities so that the present service to the shipper be maintained and improved.'"

Secretary, Anton Schager, Joliet Merchants' Association. (Population 34,670.)

The following letter to Governor Dunne, of Illinois indicates the attitude of the Merchants' Association of Joliet, regarding the proposed increase of five per cent in freight rates in Official Classification territory:

Joliet, Ill., January 9, 1914.

Dear Sir:

We beg to call your attention to the following telegram which this Association has sent to our Member of Congress, our United States Senators and also Interstate Commerce Commission at Washington, D. C., this day and date.

"Executive Board favors speedy action favoring uniform five per cent increase in freight rates in Official Classification Territory."

Our Executive Board in session decided by unanimous vote to send above telegram to the parties named and also instructed the Secretary to apprise your Excellency of the action taken in this matter so as to let you know the sentiment among the business men of Joliet in this matter. Anything that you may be able to do in favor of this movement will be appreciated and we would certainly be pleased to hear from you in reference to this communication.

Very respectfully,
Merchants' Association of Joliet,
Anton Schager, Secretary.
Joseph F. Nachbour, President.

Mayor David Laving of Kankakee. (Population 13,986.)

(1) While so far as I know, there has been no expression of business men publicly as to the five per cent increase in freight rates, I have heard a great many large business men say if rates were not satisfactory, they would be willing to accept the increase.

(2) Yes.

Mayor David Davis of Litchfield. (Population 5,971.)

(1) I believe the sentiment of the business men of our city is strongly favorable to the proposition of permitting the carriers to increase their freight rates five per cent.

Mayor W. R. Johnson of Mattoon. (Population 11,456.)

(1) The sentiment of the business men of this community is strong for an increase in freight rates. Many believe five per cent is not enough.

(2) Yes. A prompt decision should be reached with no further delay. The opinion of our business men is that nothing will improve business as much.

Secretary, H. A. Jansen, Moline Tri-City Manufacturers' Association. (Population 24,199.)

This organization has gone on record as favoring the increase in freight rates to carriers, as it believes that the railroads are entitled to some consideration and a petition will be sent to the Interstate Commerce Commission asking that such increase be granted to the railroads as in their judgment is just and right to both the railroads and the shippers.

Secretary, Kirby Smith, Mount Vernon Commercial Club. (Population 8,007.)

The following resolutions have been passed by the Mount Vernon Commercial Club regarding the proposed increase of five per cent in freight rates in Official Classification territory:

Whereas, The Interstate Commerce Commission is now giving consideration to the request of the railroads in Official Classification Territory that they be permitted to advance their freight rates uniformly five per cent,

Whereas, Your Committee has given very careful consideration to the attitude which the Commercial Club of Mt. Vernon, Illinois, should adopt respecting this request, in view of the general and local vital interest our community has in the prosperity of the whole country, the railroads of America included,

Whereas, Your Committee has after thorough investigation found, (First) That conditions with the railroads have changed materially since the whole country successfully opposed the request of the roads for a similar advance in the year 1910, (Second) That the increase in wages granted through arbitration, the increase in taxes, the increased expenditure, to insure greater safety to both the operatives and to the public, and increase of operation caused by legislation of the full crew type, have so increased the operating expenses of the railroads in general that the net revenues are insufficient to provide for that degree of rehabilitation and extension of facilities which prompt and efficient service of the shipper demands, and

Whereas, Your Committee is convinced that shippers can better afford to pay uniform advance of five per cent than to suffer in the future any impairment of the railroad service; now, therefore, be it

Resolved, That the Commercial Club of Mt. Vernon, Illinois, through its Board of Directors declares itself in favor of granting the request for a uniform increase of five per cent of all rates in the Official Classification Territory.

Resolved, That this increase be applied not to further wage advances, but to the rehabilitation and extension of facilities so that the present service of the shipper be maintained and improved;

Resolved, That a copy of these resolutions be sent to the members of the Interstate Commerce Commission, with our belief that their body should reach a final determination of the question as speedily as possible.

G. F. M. WARD, President.

KIRBY SMITH, Secretary.

Mt. Vernon, Illinois, Jan. 10, 1914.

Mayor Charles Dinsdicker of Pekin. (Population 9,897.)

(1) I have had personal conversation with quite a number of shippers who express their opinion that a beneficial action towards railroad companies will stimulate trade and general business, as under present rates, railroads are unable to keep up the necessary improvements demanded by the public.

Secretary, Willis Evans, Executive Secy., Peoria Association of Commerce. (Population 66,950.)

While our organization has not as yet, taken definite action for or against the proposed increase in freight rates, it is generally understood among the business men of Peoria that the increase should be granted. At a meeting of shippers held recently under the auspices of the Association of Commerce this subject was discussed and favorable action taken and at a meeting of the Transportation Club, representing shippers, held a few evenings ago, it was unanimously agreed that the freight rates should be advanced.

Secretary, Louis A. Zearing, Princeton Commercial Club. (Population 4,131.)

The Commercial Club of Princeton has taken no definite action regarding the question of an increase in freight rates. While the matter has not received their attention, it seems to be unanimously the sentiment of the Club that the proposed increase in freight rates should be endorsed by the general public. They feel that it is for their individual interest as well as the interest of the various railroad companies that such increase be granted.

REPLIES OF AN UNFAVORABLE CHARACTER.

Secretary, James Costillo, Bloomington Commercial Club. (Population 25,768.)

In this locality it is our observation that none of the freight payers favor the increase.

Mayor M. E. Kirkpatrick, of Granite City. (Population 9,903.)

(1) My judgment is that the business men of this city are not in favor of an increase of five per cent in freight rates.

Mayor E. F. Bradford of Ottawa. (Population 9,535.)

(1) No.

Mayor, Spring Valley. (Population 7,035.)

(1) While the matter has not been discussed in any of our local organizations, I believe that the majority of the business men do not favor such increase.

Mayor A. J. Platt of Sterling. (Population 7,464.)

(1) It is the general feeling of the business interests of our city that railroad rates are now sufficiently high.

REPLIES INDICATING UNCERTAINTY OR DIVIDED OPINION.

Secretary, F. S. Burns, Belleville Retail Merchants' Association. (Population 21,122.)

No action has been taken by this Association for or against the five per cent increase in freight rates in Official Classification territory.

Secretary, Commercial Club, Belleville.

No action has been taken by this Club for or against the five per cent increase in freight rates in Official Classification territory.

Secretary, F. R. Colburn, Belvidere Commercial Club. (Population 7,253.)

No action has been taken by this Club for or against the five per cent increase in freight rates in Official Classification territory.

Secretary, Carmi Business Mens' Association. (Population 2,833.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, H. H. Roseman, Danville Industrial Club. (Population 27,871.)

No action has been taken bv this Club for or against the five per cent increase in freight rates in Official Classification territory.

Secretary, Du Quoin Commercial Club. (Population 5,454.)

No action has been taken by this Association for or against the five per cent increase in freight rates in Official Classification territory.

Secretary, Earlville Commercial Club.

No action has been taken by this organization for or against the proposed increase. of five per cent in freight rates in Official Classification territory.

C. H. Potter, Pres., Elgin Board of Trade. (Population 25,976.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, Leonard C. Mead, Temporary Secy., Geneva Commercial Club.

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Mayor, Harvard. (Population 3,008.)

(1) There has been no resolution of any kind passed with regard to this matter in our community.

Secretary, E. F. Davis, Hinsdale Commercial Association.

This action was brought up at a meeting of our Association, but it was decided that no action should be taken at this time.

Secretary, Paul B. Fritchey, Jacksonville Chamber of Commerce. (Population 15,326.)

Up to the present time our organization has remained neutral on this matter. I note, however, in the last issue of the *Illinois Manufacturers' News* that the Joliet Retail Merchants' Association has strongly endorsed such increase.

D. P. Cleghorn, Secretary, Kankakee Commercial Association. (Population 13,986.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, J. F. Beatty, Morris Industrial Association. (Population 4,563.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Frank E. Foster, Mayor, Mount Vernon. (Population 8,007.)

(1) While the Commercial Club has passed resolutions in favor of the increase there are some in our community who differ from the position. Therefore, personally, I would answer, No.

Martin Scherff, Acting Secretary, Peoria Merchants' Association. (Population 66,950.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, L. W. Tillsburg, Pontiac Commercial Club. (Population 6,090.)

No action has been taken by this Club for or against the five per cent increase in freight rates in Official Classification territory.

Secretary, Quincy Chamber of Commerce. (Population 36,587.)

No action has been taken by this Chamber of Commerce for or against the five per cent increase in freight rates in Official Classification territory.

Secretary, A. L. Yantes, Shelbyville Commercial Club. (Population 3,590.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, Nelson A. Rickert, Waterloo Commercial Club.

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

ILLINOIS EDITORIAL COMMENT.

Chicago (Ill.) American Lumberman, December 27, 1913.

Opinions differ as to the outcome of the railroads' petition before the Interstate Commerce Commission for an advance in the Eastern freight rates but when the lumber industry is so generally in favor of permitting an advance it may be assumed that other lines of business will take a like position, that objections will be less strenuous and that the final outcome will be an increased revenue for the railroads.

Lumbermen have objected to the advance on various grounds; one of the most important being that lumber, considering the service rendered by the shippers in handling it and its desirability to the railroads as a traffic commodity, is already carrying too high a rate on the average. Yet the majority of lumbermen seem disposed to waive or defer that point in favor of what they believe would be for the general benefit of the country's business as well as of the railroads.

Chicago (Ill.) Evening Post, October, 1913.

"During July, 1913, the railroads of the United States received 4.4 per cent more money than they did in July, 1912.

"But it cost them 8.5 per cent per mile more to operate.

"These are the figures of the Bureau of Railway Economics.

"Every bit of statistics seems to strengthen the reasonable demand of the roads that the increase of their expense due to governmental regulation be balanced at the other end of the scales. There must be some 'give' in the structure somewhere, else the pressure will wreck it."

Chicago (Ill.) Evening Post, November 28, 1913.

"A man is as old as his arteries," physicians tell us, which, being interpreted, means that as long as the channels of blood supply are efficient, health and vigor are assured. Premature old age follows upon a thickening or hardening of the arteries that impedes free circulation.

It is perhaps not too far-fetched to compare the railroads of the country to the vascular system in the human anatomy. They are channels of the nation's life and commerce. Upon their efficiency depend in large degree the health and vigor of the nation. To regard them as mere collectors of fares and rates and distributers of dividends is to miss wholly a proper understanding of their function. Impairment of arteries means starvation for the brain, muscles and digestive organs. Impairment of railroads involves similar sympathetic disturbances in phase of the country's business. It is this fact that makes the problem now before the Interstate Commerce Commission one of vastly greater moment than the mere cost to the public of a five per cent increase in rates. If the railroads are justified in their complaint that they are being starved under existing conditions, a five per cent increase well may be small price to pay for averting national arterial sclerosis.

Chicago (Ill.) Inland Printer, November, 1913.

E. W. Beedle, president of the Henry O. Shepard Company, of Chicago, in an article in a recent edition of the "Inland Printer" favors the five per cent advance in freight rates asked by the steam railroads of this country. He believes better service will result and that an advance in rates will be in the interest of general prosperity.

Mr. Beedle addresses himself in particular to business men connected with the printing and publishing trade. He points out that the proposed advance is favored by Chambers of Commerce in St. Louis, Cincinnati, Baltimore, Pittsburgh and Philadelphia.

Mr. Beedle asserts that the conditions surrounding the higher freight rate movement at this time are considerably different from what they were in 1910. "Shippers," he says, "two years ago protested mainly on two grounds—first, that the carriers could not show their need of greater revenue; and second, that the proposed schedules would not fall equitably on the several classes of traffic. Industrial executives also complained that the managers had not conferred with them before filing advances. This year all three of these conditions seem to be met.

"Business men understand that in order to increase plants it is necessary to raise new capital and that surplus earnings are required as a guarantee that a return can be paid on additional stocks or bonds. Business men cannot afford to have the railroads of the country fall into a situation where augmentation of rolling stock, road and terminals is retarded. Poor service would be a greater injury to the shippers than they would suffer from any increase in rates which the Commission is likely to sanction. Railroads, too, with their vast purchases and payrolls, are an enormous factor in national prosperity. Every interest gains when the roads are vigorously carrying out projects of importance."

Chicago (Ill.) Inter Ocean, November 26, 1913.

To put the case plainly, the general situation of American railways is that of industries which are being crowded steadily toward the precipice of bankruptcy, receivership and reorganization, with wiping out of stock interest and quite possible scaling down of bond equities. Some are much farther from this precipice than others, but all are being crowded toward it.

Compelled to pay more for everything they buy, the railways are not permitted to charge more for the only thing they have to sell. So far that is the attitude of the government powers, in obedience to an assumed popular mandate. It is to be hoped that the Wilson administration will be wise in time and change the governmental attitude. For a great multitude of small investors, with votes, are bound to suffer if the railways are crowded over the precipice so plainly before them.

Chicago (Ill.) Inter Ocean, January 4, 1914.

The directors of the Illinois Manufacturers' Association have unanimously approved the report of their special committee urging the Interstate Commerce Commission to grant the request of the railways for permission to advance freight rates in Official Classification Territory, which includes, roughly speaking, all points east and south of Chicago.

The action of the Illinois manufacturers may cause surprise in some quarters, in view of their well-known activity the other way in 1908 and 1910, when they organized the shippers of the country against the advances then asked, with the result that in 1908 the railways withdrew their request and in 1910 it was denied.

The explanation is that the situation has changed and these representative leaders of Illinois industry are clear-eyed and broad-minded enough to perceive the fact and act accordingly.

Chicago (Ill.) Inter Ocean, January 17, 1914.

The directors of the National Business League of America, at their meeting in Chicago, Thursday, unanimously adopted resolutions asking the Interstate Commerce Commission to permit the railways to make "an immediate uniform increase of not less than five per cent" in freight rates.

The National Business League is a nation-wide association of prominent business men, mostly merchants and manufacturers. That is, their interest is that of the shipper—the buyer of railway service. While many of its directors are residents in and near Chicago, these resolutions do not express merely a local opinion but also that of the affiliated organizations in thirty States, ascertained through their vice-presidents of the national association.

This is probably the first time that any large number of shippers has asked that freight rates be increased. The reasons for this about-face on the part of so many representative shippers are clearly shown by the resolutions adopted, of which we present the substance:

> Sufficient and efficient transportation is necessary to the prosperity of the whole country. * * * We believe that the present net earnings of the railways are insufficient for the proper maintenance of equipment, extension of facilities, efficient service, and safety of life and property, resulting also in curtailment of purchases from dependent industries, which seriously cripples the general business of the country.

Therefore, the grant of permission to increase rates is asked "as a necessary measure, imperative to the prosperity of carrier, shipper and business interests generally."

The logic of this is conclusive. The reaching of a conclusion so logical is a gratifying sign of a renewed perception of the truth that in the long run all material interests of the American people must go up or down together, and of emergence from the delusion that it is possible to impoverish and pull down the transportation industry without all of us suffering in the end and paying for the folly.

Theoretical "railway economists," such as Louis D. Brandeis, will continue to argue, of course, that what the railways need is not higher rates but "more efficiency." Here and there a prominent business man will still insist on what is, under existing conditions, putting the cart before the horse. We note that John Wanamaker is quoted as so doing.

These gentlemen seem to forget that before improvements can be made there must be means, or a good prospect of means, with which to pay for them. Efficiency must often wait for income to support it. If Mr. Wanamaker will look back he will doubtless remember days when he had to get along with poorer equipment and less competent help than he wanted, because he could not yet afford to buy better.

That is, broadly speaking, the position of the railways. Under pressure of public sentiment which too long remembered injuries and forgot benefits they have been brought by governmental power to semi-starvation. It is absurd to ask that a half-starved man or industry show the highest efficiency.

The Interstate Commerce Commission and the Wilson administration will do well to heed the counsel of the shippers. No administration can be popular or party retain power whose name has become a synonym for industrial depression and business paralysis.

Chicago (Ill.) Inter Ocean, November 26, 1913.

To put the case plainly, the general situation of American railways is that of industries which are being crowded steadily toward the precipice of bankruptcy, receivership and reorganization, with wiping out of stock interest and quite possible scaling down of bond equities. Some are much farther from this precipice than others, but all are being crowded toward it.

Compelled to pay more for everything they buy, the railways are not permitted to charge more for the only thing they have to sell. So far that is the attitude of the governmental powers, in obedience to an assumed popular mandate. It is to be hoped that the Wilson administration will be wise in time and change the governmental attitude. For a great multitude of small investors, with votes, are bound to suffer if the railways are crowded over the precipice so plainly before them.

Chicago (Ill.) News, November 26, 1913.

As the "Tribune" recently has said, what is needed is a constructive policy, fair to the consumer, who "pays the freight"; to the shipper, whose prosperity depends upon efficient service and no favoritism; to the bona fide investor, and to his partner in the enterprise, the employe.

The fight for railroad regulation, in which the "Tribune" is glad to have had a part, has been won. But, being won, it will be lost if regulation is merely negative or punitive and does not take into account the basic need of the country for an efficient, expanding traffic system and the fundamental terms upon which such a system can be maintained under a capitalistic organization of society.

Chicago (Ill.) Tribune, November 24, 1913.

At the present date there is more right on the railroads' side than there ever has been in the past.

The worst evils of railroad extortion and mismanagement are, we believe, past forever. The most glaring cases of discrimination have been rectified. A large part of the water has been squeezed from their stocks in the recent stock market decline. The railroads are paying more and receiving less for service than ever in the past. In comparison to other industries, public and private, the railroads are probably giving the greatest service per dollar received.

It seems to them, therefore, especially hard while the cost of supplies and labor climbs steadily their schedules of rates are held in place.

Chicago (Ill.) Tribune, January 2, 1914.

It is to be hoped the rate question will not be involved unnecessarily in other considerations, however desirable it may be that the Commission, the Public and Congress should be informed, so as to correct conditions and evolve a wiser policy of railroad regulation. The freight rate decision should be rendered, if possible, pending a thorough reform of the railroads. The one thing that should be insisted upon at this time is that if the advance is granted the increased tax upon the public shall be so disposed as to profit the public.

Decatur (Ill.) Review, November 25, 1913.

The reason the net earnings are less is because of the increased cost of operating railroad properties. Gross earnings are much bigger than three years ago, but all this increase in gross has been taken away, and then more was taken away.

Of course, this situation can't continue. They will have to manage somehow to have increased net earnings with increase in investment—if they can't do this there will cease to be further investment. The point does not need argument; it is obvious.

And of course, a way is going to be found that will permit road managers to go ahead and make investments to pay for needed improvements and extensions. Anything else would not be transportation service, and without this the country could not amount to much.

Elgin (Ill.) Bews, December 5, 1913.

What the people who use the railroads want above all things is good service and increased facilities to meet their increased traffic. They need these now, and are not willing to wait four or five years until valuation of the roads is completed. They can only get these requisites by improving the credit of the roads, so that capital for the improvements can be secured at reasonable rates. The quickest way to improve credit is to increase earnings by raising rates. By thus demonstrating that rate regulation works both ways the Government would inspire investors with confidence and enable railroads to raise money.

Galesburg (Ill.) Republican Register, November 29, 1913.

It is necessary to ascertain how extensive will be the harm and who will be injured in case the companies are forced to face the future with the present rates in force and with demands for increased wages and with the increasing cost of materials.

The man who might have been hurt has probably by this time got out of the way.

This is a case in which one must in order to be fair, give a comprehensive hearing to all sides and not to one alone.

There are a million and five hundred thousand people who are employes of the railroad companies and there are a great many more whose incomes come from dividends and interest and there are the roads themselves to be equipped and maintained and these are factors that ought not to be neglected.

Peoria (Ill.) Herald, November 26, 1913.

Summing up, it was shown that as between 1910 and 1913, there was an increased tonnage, but a decrease in average revenue per ton mile, and an increase in operating revenue of 14.3 per cent, an increase of 23.13 per cent in taxes and a decrease of 13.13 per cent in property investment account. Similar figures were submitted by the other Eastern roads.

The Interstate Commerce Commission is resting under a heavy responsibility to the country. If transportation is to be paralyzed by the rate making authority, the people will suffer with the railroads. On the other hand, an increase in rates will boost the high cost of living.

Peoria (Ill.) Herald, November 26, 1913.

If railroad rates are not permitted to expand with the higher cost of operation, something will break. No arbitrary authority is strong enough to hold down the lid on economic law. Transportation will not be the "goat," neither will "the source" of the income tax be the "goat." All taxes are shifted. In the end the consumer must pay.

Peoria (Ill.) Herald, January 18, 1914.

It is an admitted fact that our railroads are to-day suffering from excess legislation. The railroads are privately owned and publicly managed. The cry for an increase in rates is not without reason.

Everything used in the construction and operation of a railroad has gone up. Labor is higher and is going higher. Material continues to advance.

On the other hand the revenues are fixed by law. The breaking point will have to be reached somewhere. If the revenue is kept fixed and the tension and growth will have to be replaced by retrogression.

It is useless to adopt a revengeful spirit and to take the stand that the railroads must suffer for the sins committed in past years. This is a short-sighted policy and the bad ecects must be borne by the entire public.

Our prosperity and that of the railroads are inseparably joined. We cannot kill one without killing the other. Make the railroads obey the laws, but if rates should be higher to enable them to extend and grow, by all means go at the question from some other standpoint than that of revenge.

Rockford (Ill.) Republican, January 3, 1914.

In the early day of the railroads there was a tendency to ignore the public, its demands and its just protests. Watered stock, arrogance, and high-handed methods developed a slow but heavy burden of resentment, so that when the public got a chance it exacted the "pound of flesh." The railroads seem to have been punished to the full limit of their present responsibility. It would seem to be time to show mercy, and recognize that in all the past mere individuals were not wholly to blame for conditions in which we were all partners.

Already many manufacturers and other shippers are generously conceding that even though it will cost them more to do their business, perhaps the railroads ought to be granted the right to increase to some extent the freight rates. President Wilson is showing a disposition to let the dead bury the dead and is willing to give every business interest the opportunity to demonstrate their ability to work constructively for measured profit while serving the public welfare.

Rockford (Ill.) Star, November 29, 1913.

Is it not time to let the great freight carriers alone? Now that they must behave themselves, let us give them a chance. Let us stop the sort of regulation that demagogues aim at and the "strike" bill that fills the calendars of our legislature. As to permitting them to raise freight rates, the Interstate Commerce Commission will decide for the best general interests.

Rockford (Ill.) Star, December 9, 1913.

An eminent English authority, the Economist, points out how an increase of five per cent in the freight rates in this country, would help business and the arguments appear sound, appealing to all interested in the continuation unabated of the present era of prosperity in this country. It calls attention to the fact that because of the dearness of money for the past two years the railroads have issued short term notes for loans, and that there will be about $500,000,000 of these notes fall due in 1914. It is apparent that if the railroads are unable to refund these loans they will be compelled to stop improvements and reduce upkeep to the lowest possible point. Since the railroads buy more than half of all the steel produced in the country, a cessation of activity on the part of railroads would result in a marked decline in the steel industry, which would result in a sharp setback to industry throughout the country. Its ramifications would be nation-wide.

OHIO.

REPLIES OF A FAVORABLE CHARACTER.

Mayor Frank W. Rockwell of Akron. (Population 69,067.)

(1) The number of people with whom I have come in contact and who could give an intelligent answer to the question, is limited. I believe the sentiment of these people is that the railroads should be allowed to charge rates that, with competitive management, would secure revenues to obtain a reasonable return on the investment, after eliminating that part of the capital commonly known as water.

Mayor, O. F. Rowland of Athens. (Population 5,463.)

(1) I have found the sentiment of this community to be favorable to the five per cent increase asked for.

Secretary, F. L. Hopley, Bucyrus Industrial Association. (Population 8,122.)

While our Association has not discussed the matter in question, and has passed no resolution we feel sure that our members would maintain the "live and let live policy."

Arthur J. Bennett, Secretary, Cambridge Board of Trade. (Population 11,327.)

While no resolution has been passed by our organization on the question of increased rates, it has been discussed among our members at various times and the unanimous opinion is that the railroads should be granted the increase, for the fact is well known that they have been up against increased cost of operating and they must have this increase in order to do business. We are also of the opinion that should the Interstate Commerce Commission grant the increase, it will clear away the clouds that are hanging over business and give a new stimulus to trade and we hope that they will grant it.

Charles A. Stolberg, Mayor, Canton. (Population 50,217.)

(1) I am heartily in favor of the increase in freight rates and I believe it would be of benefit to the citizens of Canton.

Secretary, Canton Commercial Club. (Population 50,217.)

The members of the Canton Commercial Club are very much in favor of the five per cent increase being allowed the railroads. Because of railway retrenchments we have been seriously damaged financially. We have informed the Interstate Commerce Commission that this Club is in favor of granting the railroads the five per cent increase.

Secretary, Cincinnati Business Men's Club. (Population 363,591.)

The following resolutions covering the proposed increase in freight rates in Official Classification territory have been passed by the Cincinnati Business Men's Club:

> Whereas, The whole business of the country depends upon the efficiency of the railroad service, and
>
> Whereas, The railroads have in most parts of the country outgrown their facilities, and business is suffering from a lack of proper and sufficient railroad equipment, and from the inability of the railroads to make necessary extensions, additional terminals and to supply the demands which shippers and new territory can legitimately demand and expect, and
>
> Whereas, This condition of affairs comes from the fact that the railroads are operating on a margin too slender to allow them to meet the demands of the shippers, therefore be it
>
> Resolved, By the Traffic Committee of the Business Men's Club, that to relieve this condition of affairs, which is resulting in a partial paralysis of business, that we petition the Interstate Commerce Commission to allow the railroads, in the Official Classification Territory, to increase their freight rates by a horizontal advance of five per cent, believing that this increase would supply the railroads with revenue sufficient to relieve the existing unsatisfactory conditions. We believe that, as a general principle, the money which the various localities contribute to this cause should be expended in those localities.

Secretary, Cleveland Branch, National Metal Trades Association.

The following resolution has been adopted unanimously by our Board of Directors on the matter of an increase in freight rates:

Whereas, The railways of this country have recently petitioned the Interstate Commerce Commission for an increase in freight rates in Official Classification Territory, an increase of five per cent, and

Whereas, From the facts presented to that Commission by the leading railroad men of this country in support of this petition for such an increase, shows conclusively that the railroads are entitled to the increase, and

Whereas, an increase in freight rates at this time would make and tend for greater stability in all lines of business, would open up further the avenues of trade, and would call for a greater employment of skilled and unskilled labor,

Resolved, That the Board of Directors of the Cleveland Branch, National Metal Trades Association are and hereby declare that they are in favor of the railroads of this country receiving the entire increase in freight rates of five per cent as outlined in their petition presented to the Interstate Commerce Commission of the United States.

Cleveland Branch, National Metal Trades Asso.

J. H. Foster, Pres.
Frederick Metcalf, Vice-Pres.
Franklin Schneider, Treas.
H. J. Smith,
J. H. Francis,
Christian Girl,
C. B. Wilson,
John Hertner,
Directors.

Secretary, Geo. N. Gillette, Columbus Chamber of Commerce. (Population 181,511.)

The matter referred to has had the attention of our Traffic Committee and while we see no reason to oppose the proposed increase in freight rates, no action has been taken approving the same.

Secretary, W. H. Hinman, Elyria Chamber of Commerce. (Population 14,825.)

This Chamber has not taken any action with regard to this question. However, I have heard the matter talked among different persons in the community and it is my personal opinion that the average man in this vicinity would rather favor the increase in freight rates.

Secretary, Walter M. Cooney, Lima Progressive Association. (Population 30.508.)

The following letter forwarded on the third day of January to the Honorable Chairman of the Interstate Commerce Commission, indicates the favorable attitude by this organization towards the proposed increase in freight rates in Official Classification territory:

Lima, Ohio, Jan. 3, 1914.

Hon. E. E. Clark, Chairman,
Interstate Commerce Commission,
Washington, D. C.

Dear Sir:

At a meeting of this organization held last evening, the following resolution was unanimously adopted:

Resolved, That the Lima Progressive Association of Lima, Ohio, wishes to be placed on record as in favor of a reasonable increase of railroad freight rates, same being warranted by the increased cost of operation and advisable because it will result in more railroad construction, better accommodation and safer transportation.

Yours very respectfully,
(Signed) Walter M. Cooney,
Secretary

Secretary, Marion Club. (Population 18,232,)

The following resolutions passed on December 26, 1913, by the Marion Club indicate the attitude of this organization towards the proposed increase in freight rates:

Be it resolved, by the members of the Marion Club, representing every branch of the business interests of Marion, Ohio, that, we, cordially favor the application of the railroads for such reasonable increase of freight rates, as may be necessary to cover the increased cost of operation brought about by the numerous demands on the railroads; that such increase is expedient and desirable, in that, it will enable the railroads to enter upon the making of betterments for the accommodation of the public in the transportation of freight and passengers; and, in that, it will restore confidence in the fairness of our citizenship, which will inspire and encourage further railroad construction, all to the end, that prosperity and good feeling may be fostered and strengthened for the common good and welfare.

Be it further resolved, that this resolution be suitably engrossed, and that copies of the same be transmitted to Hon. John A. Key, Representative, and Hon. Atlee Pomerene, and Hon. Theodore E. Burton, Senators, our representatives in Congress, for their consideration, and a copy to the Interstate Commerce Commission, for its information.

THE MARION CLUB.

December 26, 1913.

By "John A. Schroeter,"
Its President.

Ohio Shippers' Association.

The Ohio Shippers Association has sent the Interstate Commerce Commission a letter with reference to the proposed increase in freight rates which has in part, the following to say:

It is the desire of every member of the association that the proposed increase may be permitted, if the preponderance of evidence shall, in the opinion of the Commission, show that such increase is necessary in order to produce sufficient funds to cover the cost of efficient and economical management and operation of the properties and in addition a reasonable percentage of profit on the investment.

Mayor Adam Frick of Portsmouth. (Population 24,481.)

(1) Personally, I am in favor of the railways being granted rates that will pay dividends, keep up to the required standard

their tracks and equipment, and in addition to be able to sufficiently pay those who perform the actual toil in conducting railway operations.

Secretary, F. P. Chaffee, Steubenville Chamber of Commerce. (Population 22,391.)

The following resolutions relative to the proposed increase in freight rates in Official Classification territory, were passed by the Steubenville Chamber of Commerce on December 5, 1913:

Whereas, The cost of labor and materials of all kinds and rigid restriction have advanced very decidedly in recent years, and

Whereas, The freight rates on the various railroads are claimed to be too low for the proper financing and equipping of such means of transportation, and

Whereas, It is of utmost importance to the shippers to get a quicker handling of freights than is now admissible with the restricted equipment furnished by the various trunk-line railroads, and

Whereas, The Steubenville District handles probably as large a freight tonnage as any district of similar size in the country, and

Whereas, We believe that a reasonable increase in freight rates is just and would encourage better equipment and secure better service from the railroads in the handling of freights, therefore

Be It Resolved, By the Chamber of Commerce of Steubenville, Ohio, that the request of the various railroads to be allowed to put on a five per cent increase in freight rates is a just one and that we recommend to the Interstate Commerce Commission that the same be granted.

Resolved Further, That a copy of these resolutions be sent to the President of the Interstate Commerce Commission, the Chairman of the Central Railroad Association, our Senators and Representatives in Congress, the Secretary of the Chamber of Commerce of the United States, the proper officials of the railroads entering Steubenville and given the local press.

Mayor of Tiffin. (Population 11,894.)

(1) Yes.
(2) Yes.

Secretary, John D. Biggers, Toledo Commerce Club. (Population 168,497.)

The following resolutions were draughted by a special committee of the Commerce Club of Toledo some time ago and forwarded to the Interstate Commerce Commission:

Whereas, Certain railroads in what is known as Official Classification Territory, have in effect requested from the Interstate Commerce Commission permission to advance their freight rates uniformly five per cent, and

Whereas, We believe that the railroads should receive sufficient revenue to enable them to operate successfully under present conditions and provide service adequate to the needs of the commerce of the country, therefore

Be It Resolved, That we, the shippers of Toledo, acting in conjunction with the Toledo Commerce Club, do hereby petition the Interstate Commerce Commission to re-open case No. 3400, or, preferably, to grant a hearing on the new petition without making necessary the formality of the filing of new tariffs by the various railroads in this territory, and

Be It Further Resolved, That we hereby request the Interstate Commerce Commission to grant the uniform five per cent increase in freight rates as promptly as circumstances will permit, providing the representatives of the railroads can, and do, present to the Interstate Commerce Commission, such facts and figures as will prove the necessity of such increase in revenue.

Mayor H. M. Gee of Van Wert. (Population 7,157.)

(1) I am sure that our business men are in favor of the increase.

REPLIES OF AN UNFAVORABLE CHARACTER.

Mayor L. Williams of Canal Dover. (Population 6,621.)

(1) No.
(2) No.

Mayor W. A. Schmaltz, of Defiance. (Population 7,327.)

(1) In interviewing several of the large shippers of our city, I find that they are against any increase in freight rates.

Mayor Edw. H. Kuhn of Gallipolis. (Population 5,560.)

(1) No.
(2) No.

Mayor Fred A. Hinkel of Hamilton. (Population 35,279.)

(1) Speaking from the standpoint of the majority of the people of the city of Hamilton, I would say that they are opposed to an increase in freight rates. They view it from the standpoint of the consumer who must in the end foot the bill by the way of increased cost in commodities.

Mayor Wm. D. Robb of Lima. (Population 30,508.)

(1) I am opposed to such increase.

REPLIES INDICATING UNCERTAINTY OR DIVIDED OPINION.

Secretary, Vincent S. Stevens, Akron Chamber of Commerce. (Population 69,067.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Theodore Hall, Secretary, Ashtabula Chamber of Commerce. (Population 18,266.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, Barberton Chamber of Commerce. (Population 9,410.)

No action has been taken by the Chamber of Commerce for or against the five per cent increase in freight rates in Official Classification territory.

Secretary, Earnest Thompson, Bellefontaine Industrial Club. (Population 8,238.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, R. R. Parkhurst, Bellevue Chamber of Commerce. (Population 5,209.)

No action has been taken by this Chamber of Commerce for or against the five per cent increase in freight rates in Official Classification territory.

Charles A. Stolberg, Mayor of Canton. (Population 50,217.)

(1) I am unable to answer your question as I have heard no expressions from business men regarding this matter.

Secretary, L. E. Deuble, Canton Business Men's Association. (Population 50,217.)

No action has been taken by this organization for or against the proposed five per cent increase in freight rates in Official Classification territory.

Newton D. Baker, Mayor, Cleveland. (Population 560,663.)

(1) I regret to say that I do not know enough about the facts in connection with the case of the railways for higher freight rates, to express an opinion.

Secretary, Cleveland Chamber of Industry.

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, Edward Hobday, Cleveland Industrial Association.

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, Alfred H. Stratton, Salem Chamber of Commerce. (Population 8,943.)

No action has been taken by the organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Manager, G. L. Cory, Springfield Traffic Bureau. (Population 46,921.)

Our membership is somewhat divided in respect to the increase in freight rates in Official Classification territory, and it seems to be the prevailing opinion that the facts as developed by the Interstate Commerce Commission should govern and our people are willing to abide by the conclusion reached.

H. E. Rogers, Secretary, Wellington Board of Trade.

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

OHIO EDITORIAL COMMENT.

Cincinnati (O.) Commercial Tribune, May, 1913.

It is the fashion to berate the railroads, but it should be remembered that the managers of them are subjected to the same limitations which apply to all business men. It is believed that the Interstate Commerce Commission will recognize the new condition.

Cincinnati (O.) Enquirer, December 20, 1913.

The serious condition the railroad world is facing has already been recognized and met in several countries of Europe, where the Governments have advanced all rates on passengers and goods. In our country the question now is not so much as to change of ownership as to a living rate for service under present control. Evidence of some of the roads laid before the Interstate Commerce Commission indicates that they must have better rates if they are to continue business outside of receiverships. The roads north of the Potomac and Ohio Rivers and east of the Mississippi, ask for a five per cent increase on freight rates, which would add between thirty-five and forty million dollars to the revenues of the roads pleading. In three years these lines have expended over $600,000,000 in additions and improvements, while their net income has decreased more than $16,000,000 because expenses of operation have increased faster than operating revenues. Said one of the prominent men testifying: "We are suffering from slow starvation."

Cincinnati (O.) Times Star, December 27, 1913.

A sentiment in favor of the Interstate Commerce Commission granting the five per cent increase in freight rates, asked for by the railroads, is apparently growing among Cincinnati business men. Although the Cincinnati business community has been in the forefront of the fight for improved switching service, better freight rates, or other advantages from the railroads, yet there is now a widespread feeling in favor of granting the roads their request for the five per cent increase.

Columbus (O.) Dispatch, January 26, 1914.

There are those who find in the President's latest address to Congress signs of approval of the request of the railroad companies for an increase of freight rates. By these it is felt that the Interstate Commerce Commission will take more and do something, even, in the absence of legal restraint upon stock and bond issues, to relieve the situation. But the President is not autocrat. In his words with regard to the railroads, he has simply reflected a very general feeling that, between rate restriction and wage increase, the companies have been caught and crippled. If the President feels that the time has come for granting a measure of relief, he is simply making an estimate that the Commissioners themselves and others are as able to make as he.

Sandusky (O.) Register, December 10, 1913.

It does not require evidence to prove that increased expenses in pay rolls mean a reduction in the revenue of the roads unless rates are increased, or running expenses are reduced in other departments of the service. Railroads cannot operate without revenue. They cannot pay running expenses much less interest, taxes, maintenances and improvements—they cannot provide increased facilities for the public, more cars, engines and sidings to take care of increased business demands without more money coming into their treasuries.

MASSACHUSETTS.

REPLIES OF A FAVORABLE CHARACTER.

Mayor Herman A. MacDonald of Beverley. (Population 18,650.)

(1) Yes; especially in New England, where the railroads are in a bad financial state. To be reduced again, however, when conditions warrant so doing.

(2) I should say, Yes

Mayor John F. Fitzgerald of Boston. (Population 670,585.)

(1) I believe Boston favors a proper increase of railroad rates and it is my opinion that five per cent is not too great an increase.

(2) I believe the prosperity of the whole country largely depends upon proper treatment of the railroads and action by the Interstate Commerce Commission should be taken immediately.

William A. Hart, Secretary, Fall River Chamber of Commerce. (Population 119,295.)

At a meeting of the Board of Directors on February 3d, a report was adopted favoring the five per cent increase for which the railroads are asking. A copy of this vote was sent to the Interstate Commerce Commission and the following is a copy of the committee's resolutions on the subject:

To the Board of Directors,
Chamber of Commerce,
Fall River, Mass.

Gentlemen:

The Transportation Committee is in favor of requesting the Interstate Commerce Commission to allow the transportation companies to increase the freight rate the five per cent as per petition for the following reasons:

First—That transportation rates are lower by forty per cent than in any other country.

Second—That transportation companies must have adequate income to meet current expenses, cost of up-keep and improvements, and also pay to stockholders a reasonable profit on their investment.

Third—That the 1,500,000 men employed by the transportation companies are continually asking for and receiving increased compensation, and that all materials used by said companies are substantially higher than at any previous time.

Fourth—That business interests are continually calling for improved terminal and transportation facilities.

Fifth—That the increase asked for is so slight that no one will be seriously affected, and last that the prosperity of the transportation companies is absolutely necessary for the prosperity of the country at large.

Respectfully submitted,
Transportation Committee.

Mayor of Danvers. (Population 9,407.)

(1) Yes.

(2) Yes.

Secretary, J. E. Barber, Franklin Business Men's Association. (Population 5,641.)

While no action has been taken by our Association, our business men are a unit in believing that a reasonable advance should be permitted, and that at once.

Secretary, Daniel N. Casey, Haverhill Board of Trade. (Population 44,115.)

The Transportation Committee of this Board has endorsed the recent resolution of the Boston Chamber of Commerce regarding the railroads' situation. We believe that a moderate increase without discrimination, would be fair and we would be willing to accept it, providing it does not impose too hard a penalty upon the manufacturing interests.

Secretary, George E. Rex, Acting Secy., Lawrence Chamber of Commerce. (Population 85,892.)

I believe that I can safely say that our people are not opposed to granting the railroads a reasonable advance in rates, but inasmuch as we are located on the Boston and Maine, which has been granted a scale of advances much greater than five per cent by the Interstate Commerce Commission, and as our people have generously agreed to this advance, it does not seem that the proposed advance of five per cent can affect the people of this vicinity.

W. H. Day, Jr., Mgr. Trf. Bureau, Lynn Chamber of Commerce. (Population 89,336.)

The general five per cent increase asked for by Eastern roads we are heartily in favor of, believing that the carriers are entitled to a revenue sufficiently remunerative to meet their ever-increasing demands and maintain that efficiency in service which is so essential and desirable both to the shipper and the receiver.

Mayor P. J. Moore of Pittsfield. (Population 32,121.)

(1) Yes.

(2) Yes.

Secretary, H. T. Hyde, Southbridge Board of Trade. (Population 12,592.)

Our organization has taken no official action regarding the proposed increase in freight rates. I am sure, however, that the general sentiment and attitude of the majority of our members would be to endorse such proposed increase.

Traffic Manager, Albert Snyder, Springfield Board of Trade. (Population 88,926.)

The following resolution has been passed by the Board of Directors of the Springfield Board of Trade, covering the railways' situation in regard to the proposed increase in freight rates:

> Whereas, A decision has been reached between the Federal Government and the New York, New Haven & Hartford Railroad in regard to the complete separation of the Boston & Maine System from the New York, New Haven & Hartford System,
>
> We, the directors of the Springfield Board of Trade, upon the recommendation of our Traffic and Transportation Committee, do hereby
>
> Resolve, That it is necessary for all commercial and industrial interests of New England to unite in supporting the railroads, which will provide quick transportation, immediate delivery of goods, and satisfactory and ample train service, and which shall have adequate terminals, modern equipment and rolling stock. Be it further
>
> Resolved, That in view of the condition of the Boston & Maine Railroad, and in order that this railroad may be able once more to maintain satisfactory service, it seems desirable that there should be a complete reorganization, and that the railroad officials should lend every effort to relieve the Boston & Maine Railroad of all burdensome contracts and expenses, and that the Boston & Maine Railroad should be conducted as an independent New England railroad first and foremost for the interest of New England. And be it further
>
> Resolved, That the United States Government should establish at once a more equitable basis of payment to the railroads for carrying the Parcel Post, and that we request our Representatives in Congress to use all effort to bring about this readjustment. And be it further
>
> Resolved, That the public should be willing to recognize the existing conditions and to cooperate to the fullest extent. And be it further
>
> Resolved, That the Board of Directors of the Springfield Board of Trade hereby express the willingness of this organization to co-operate in every instance, through committees or otherwise, in bringing about a satisfactory solution of this problem.

H. R. Kingsbury, Secretary, Westfield Board of Trade. (Population 16,044.)

No formal resolutions have been passed by us upon the matter referred to, but at our last meeting it was voted to acknowledge your communication and there was a very general expression of the opinion that the railroads should be permitted to have in force such rates as would be sufficient to provide efficient and satisfactory service and at the same time enough income to return to the investor a reasonable and fair interest upon his investment.

Mayor of Whitman. (Population 7,292.)

(1) Yes, as to east or westbound through rates. Local class rates should be revised before being admitted to any increases.

(2) If the increase is granted we think the public is not opposed to the roads securing the benefits of such advances as quickly as possible.

REPLIES OF AN UNFAVORABLE CHARACTER.

Mayor of Franklin. (Population 5,641.)

(1) No.

Mayor John H. Wood of Holyoke. (Population 57,730.)

(1) I am informed that the Holyoke Board of Trade voted to protest against the proposed increase in Official Classification territory, as it felt that our manufacturers would be seriously affected by the proposed rates. Holyoke imports a great amount of raw material and ships it away as finished product. The Board of Trade also feels that in view of the petition of the Boston and Maine for an increase in their class rates and a readjustment in their commodity rates, it would greatly affect Holyoke and as such increases have been practically decided upon, a further increase of five per cent would be detrimental to the industrial and business life of our city.

E. L. Taber, Secretary, Holyoke Board of Trade.

Our organization has gone on record as being opposed to the proposed increase in freight rates by all railroads in Official Classification territory. This proposed increase affects our manufacturers both on the incoming raw material and on the outgoing manufactured material.

REPLIES INDICATING UNCERTAINTY OR DIVIDED OPINION.

Secretary, Wm. H. Gray, Cambridge Board of Trade. (Population 104,839.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, J. F. McLaughlin, Leominister Board of Trade. (Population 17,580.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, Herbert E. King, Mansfield Board of Trade. (Population 5,183.)

No action has been taken by this organization for or against the proposed increase in freight rates in Official Classification territory.

Secretary, John J. Kennedy, Northampton Board of Trade. (Population 19,431.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, B. A. Rowe, Norwood Board of Trade. (Population 8,014.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

President, Geo. H. Southard, Jr., Pittsfield Board of Trade. (Population 32,121.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, Plymouth Commercial Club. (Population 12,141.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, Geo. O. Wentworth, Stoughton Board of Trade. (Population 6,316.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, Fred. E. Thompson, Westboro Board of Trade. (Population 5,446.)

While no action has as yet been taken by our organization in reference to the proposed advance in freight rates, I feel that if it was, they would endorse the proposed advances.

A. F. Evans, Corresponding Secretary, Winchendon Board of Trade. (Population 5,678.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Winthrop Magee, Chrmn. Board of Selectmen, Winthrop. (Population 10,132.)

(1) Having no freight facilities, we are not in a position to reply to your question.

Secretary, A. J. Pilling, Winthrop Board of Trade.

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

MASSACHUSETTS EDITORIAL COMMENT.

Boston (Mass.) Advertiser, May, 1913.

There has been a cessation of new territorial development by building new lines of road.

Boston (Mass.) Advertiser, November 28, 1913.

One of the fundamental questions to be decided is whether the railroads, because they are under Government control, are to be refused the privilege of meeting their increased expenses through higher prices for their product, which is transportation, while all other corporations, whose operations are not regulated by the Government, are at liberty to advance prices as far as the public will submit. In other words, it is a question whether Government regulation means simply that prices shall be held down, without regard to the conditions.

The Arbitration Board has stated that with the increased wages and cost of materials the railroads should have some means of recuperation, and it is thought that this may have some effect upon the Interstate Commerce Commission, though the fact must be known to the latter, without the endorsement of the Arbitration Board. By dividend reductions most of the railroads can survive even though they are not permitted to advance rates, but the reduction or suspension of dividends would mean that they could obtain additional capital only on unsatisfactory terms, and their operations would be curtailed in consequence.

Boston (Mass.) Commercial, December 20, 1913.

It is an encouraging symptom that Chambers of Commerce are beginning to go on record in favor of the Interstate Commerce Commission granting to the railroads the privilege of increasing freight rates. These organizations, made up for the most part of middlemen and retailers whose commissions and profits are the largest items in the high cost of the country's commodities to consumers, have been chiefly responsible for the heckling to which the railroads have been subjected during the past few years.

Now these middlemen are beginning to realize that they are likely to have a corpse on their hands, that the vivisection is being carried too far, and that by wrecking the credit of the great transportation systems they are destroying at one stroke the facilities of trade and the buying power of the public.

Boston (Mass.) Evening Transcript, November 25, 1913.

Though it is only a comparatively small portion of the public that has a direct financial interest in the prosperity of the railroads, it is the entire public that is helped or hurt by the character of service rendered. It is not alone the directors or the stockholders who are concerned with good roadbeds, strong bridges, comfortable cars and regular schedules, but everyone that avails himself of these public utilities, whether in a greater or less degree. The controversy, therefore, is not confined to the railroads and the shippers, but involves almost our entire people. They want to see the railroads render good and safe service, and there seems at present no better way to secure it than by granting the petition for a rate increase.

Boston (Mass.) Globe, December 19, 1913.

The stockholders are only a small portion of the community which is helped or hurt by the prosperity or adversity of our railroads. This point was well brought out in yesterday's "Globe" by Mr. J. H. Hale, who has been called the "Peach King" of Connecticut. A producer whose goods are freighted on roads from the South and from Connecticut to the Boston market and a business man who thoroughly understands the railroad situation, he appreciates the urgent fact that our railroads need money in order to perform the service required of them by the public and that the way to obtain that money is to increase the freight rates.

If New England is to grow, and efficient railroad service is necessary, not only for our industrial concerns, but for our farmers, big and little. Mr. Hale advises the farmers of New England to unite in requestiong that the railroads be allowed to charge higher rates. Higher rates spell prosperity. They mean the development of the great agricultural possibilities of this section of our great country.

Boston (Mass.) Post, May, 1913.

The public will have to chip in a bit for the increased pay to employes, and we believe it is perfectly willing to.

Brocton (Mass.) Times, May, 1913.

We are learning, little by little, we cannot have all the good things of life without paying the freight.

Fall River (Mass.) News, May, 1913.

These institutions are friends of the people and can only prosper as they serve the needs of the people. But the people must pay for the service rendered.

Fall River (Mass.) News, November 28, 1913.

Since the business depends upon the support of private capital which can only be obtained if there is a prospect of a fair return, and since the business must go on in any event, it follows that either the Government must run the railroads or they must be allowed to make a fair profit in the transportation of freight and passengers. * * *

It is now up to the Government, which has assumed the rate-regulating power, to exercise it in the interest of fairness to the railroads, as well as to the public. Rates may be raised, as well as lowered, and must be if a fair return on the investment can not otherwise be secured. The country must have more and better railroads, and no power of Government can force new capital into the road or keep old capital there if it can be more profitably employed elsewhere.

Farmingham (Mass.) Tribune, January 13, 1914.

A raise in railroad rates would re-establish confidence in the willingness of the public to permit a fair dividend on invested funds. It would form a basis of prosperity on which the work of economic reconstruction could go on. Railroad expenses have increased much faster than earnings.. It is by no means clear, even with the utmost economy and good management, that a fair dividend can be paid on the present cost of labor and equipment.

Lowell (Mass.) Courier Citizen, January 12, 1914.

There is no doubt that the advance would start the railroads buying, and that would give the much-needed impetus to industry. The sooner the Commission decides to allow it the better for the country. If it is refused things will go on as they are, and that is not in vigorous fashion.

New Bedford (Mass.) Mercury, May, 1913.

Public support has appeared to be behind the demands of the coal miners from time to time and if the public was a good sport it would not grumble at the higher prices of the commodity that are a direct result. It is said of the railroad situation, that if the corporations were not under duress they could supply their labor demands without trouble. The public is responsible for the artificially high costs of living and it should be willing to stand the gaff of high prices which are contingent upon high wages.

New Bedford (Mass.) Mercury, November 29, 1913.

From the fact that up to the present time there has been no antagonism on the part of shippers, such as was displayed three years ago, it is reasonable to assume that the action taken this week by the Chicago Association of Commerce fairly represents the attitude of the public. That body passed a resolution to the effect that it was "in sympathy with the plan of having the question adjudicated by the Interstate Commerce Commission, that body to determine from the facts the necessity for proposed advance." That the railroads must raise large sums for needed improvements was only recently pointed out by Chairman Clark, of the Interstate Commerce Commission.

Newburyport (Mass.) Herald, December 20, 1913.

If persistent rumor means anything, the Eastern railroads are to be allowed a rate increase by the Interstate Commerce Commission. That some such increase is badly needed seems to be pretty well agreed by all parties.

No. Adams (Mass.) Transcript, May, 1913.

The railroads are entitled to fair play, and the people must see that they have it or prepare to share the disastrous consequences which must ensue in the absence of fair play.

Springfield (Mass.) Homestead, November 29, 1913.

The railroads are insisting that they are hard hit, that they really must have money in order to carry on business properly at the old stand. If the assertion is true, and it seems probable that it is, a calm presentation of the facts—and they must be facts—will react upon the Interstate Commerce Commission directly or through public opinion and allow the needed increase in rates.

Springfield (Mass.) News, December 16, 1913.

Evidently the public is being prepared for an increase in railroad freight rates. The market reports all indicate wide hesitancy in business and this state of affairs is attributed to the alleged poverty of the railroads. There are indications too that the plea on behalf of the railroads is on the point of being heeded by the Interstate Commerce Commission.

Springfield (Mass.) Republican, May, 1913.

Much has been made of the claim that greater efficiency in running railroads would increase their revenues, but, unless we are to assume the grossest kind of laxness hitherto, this alone would not produce earnings sufficient for the emergency. We cannot be justified in regulating railroads to death. The railroads are likely to find the Interstate Commerce Commission much more favorably disposed than once toward some measure of relief.

Taunton (Mass.) Gazette, December 13, 1913.

One thing appears to be certain in the varied elements composing the Eastern railroad muddle and that is that the roads must have a greater income in order to meet their running expenses, to say nothing about paying dividends.

Even if we are obliged to admit that there have been grave errors in management which have proved very costly the increase in operating expenses along thoroughly legitimate and well managed lines has been so great that the income of the property must rise in order to keep these big properties from continuing to be seriously handicapped.

An increase in freight rates appears to be a moral certainty in the future.

How much this increase may be is uncertain but it is likely to be five per cent or more.

If we are to have railroads we will have to pay a sum sufficient for their proper maintenance when we use them and watch to see that their business, so far as public interest is concerned, is properly managed.

Worcester (Mass.) Gazette, May, 1913.

The railroads cannot be regulated out of existence.

Worcester (Mass.) Gazette, November 28, 1913.

There are good reasons for believing also that the increase in freight rates may be allowed the Eastern railroads as the result of the inquiry now on. Whether the five per cent asked for will be granted is another question to be determined by the future. It is evident that the expenses of railroads cannot be made to increase by Government edict and demands of both public and employes without making necessary an increase in the charges from which they make their revenue. When a railroad faces such conditions it is in precisely the same condition as an individual who faces an increase of a cost of living all along the line.

MICHIGAN.

REPLIES OF A FAVORABLE CHARACTER.

Martin Herald, Mayor, Dowagiac. (Population 5,088.)

(1) I have consulted with the business men of this city and can say that the proposed advance in freight rates meets with their approval.

(2) So far as I know it is favorable.

J. C. Knox, Secretary, Michigan Hardwood Manufacturers' Association, Cadillac. (Population 8,375.)

Your letter to the Secretary of the Board of Trade of this city has been referred to the writer for reply. Speaking more particularly of the Michigan Hardwood Manufacturers' Association, representing large lumber interests, it is the opinion of many of our more important members that the railroads should be allowed the advance of five per cent in Official Classification territory. While our Association has not gone on record as a whole as favoring the advance, owing to the fact that there are some members who oppose it, I think I can safely say that they are willing to abide by the decision of the Interstate Commerce Commission and that there will be no opposition by any of our members. It is hoped that the matter will be settled satisfactorily to the carriers and shippers alike, as we are convinced that the prolonged agitation of this subject is not favorable to either shipper or carrier and that the sooner the matter is adjusted the better it will be for both.

John Comin, Secretary, Three Rivers Commercial Club. (Population 5,072.)

In response to your request the matter of an increase in freight rates was brought before the Commercial Club and the following resolution passed:

"WHEREAS, In recent years, the railroads have shown a disposition to comply with the wishes of the public in furnishing efficient service at reasonable rates, and, whereas, a heavy increase in expenditures for new equipment and an increased wage are imperatively demanded, therefore, be it

"*Resolved,* That it is the sense of this Club that the increase in freight rates recently asked by the railroads in their petition to the Interstate Commerce Commission should be granted."

Secretary, Michigan Manufacturers' Association, Detroit. (Population 465,766.)

The following resolutions with reference to the proposed increases in freight rates in Official Classification territory were passed by the Detroit Manufacturers' Association May 22,1913:

Resolved, That the Board of Directors of the Michigan Manufacturers' Association does hereby express its tentative approval of the proposal of the Railroad Carriers in Official Classification Territory for a five per cent increase in freight rates. The Board is not advised as to the present facts upon which this proposed raise is based, but is impressed with the idea that the expenses of the carriers have greatly increased and their net earnings have been decreased. The Board is of the belief that a horizontal increase of five per cent is preferable to increase on particular traffic in certain and particular localities, or increases of charges for switching and side-track service and other service incidental to transportation, since the latter tend to produce discrimination. It is therefore

Resolved, That a copy of this resolution be distributed among all Michigan manufacturers and their opinion and views upon the proposal of the carriers be collected and reported to the Board in order that it may, with that information before it, take definite action for or against the proposal of the railroads.

Mayor C. S. Mott of Flint. (Population 38,550.)

(1) I think the general consensus of opinion regarding railroads is that while the troubles the railroads find themselves in at the present time, are undoubtedly due to the way their business has been managed in the past, still the pendulum has been swung pretty far the other way and some of the largest receivers and shippers of freight with whom I have talked are of the opinion that the carriers are entitled to a reasonable increase—such as five per cent, provided it is general in its application; that is, without discrimination for or against any particular articles or classification.

John H. Reicherdt, Secretary, Grand Haven Commercial Association. (Population 5,856.)

While this matter has not been acted upon at a regular meeting, we venture to say in behalf of our organization that they would be favorable to permitting such an increase on the part of the Interstate Commerce Commission.

Mayor F. J. Bowden of Houghton. (Population 5,113.)

(1) I wish to state that the majority sentiment of this community recognizes the revolution in railroading brought about by the active work of the Interstate Commerce Commission which has resulted in so many improvements for the benefit of the public, such as steel cars, block systems for protection of trains and the consequent improvements necessary in the power to handle these heavier trains, all of which has placed additional burden in the way of operating expenses for which no provision has been made in increasing operating revenues, other than what might have been brought about by the increase of business in growing communities. This naturally leaves the railroads without the usual relief that a commercial concern would have in raising its prices to offset improvements in the class of goods offered for sale. Therefore, this community may be registered as in favor of granting the increased rates requested by the railroads as the general sentiment is such that a small advance would work no hardship on any particular individual and would no doubt rebound in better service and improvements to a large number of communities and undoubtedly stimulate business in general.

Mayor of Iron Mountain. (Population 9,216.)

(1) Yes.

(2) Yes.

Mayor of Kenosha.* (Population 21,371.)

(1) I have taken up the matter of the proposed increase in freight rates with the largest shippers and business men in Kenosha and find they are favorable to the increase of five per cent.

(2) In answer to question No. 2, it was unanimously declared that the increase be granted promptly, leaving for future consideration any individual rate adjustments that may be necessary.

R. R. Darwin, Trf. Comr., Lansing Chamber of Commerce. (Population 31,229.)

The Manufacturers' and Jobbers' Club of Lansing, represented by the Chamber of Commerce, has declared themselves in favor of the five per cent horizontal advance in freight rates upon such commodities as will bear this advance, but making no specific restrictions. They would not, however, be in favor of this advance being granted without a proper investigation by the Interstate Commerce Commission.

Mayor of Marshfield. (Population 5,783.)

(1) We believe it is not any matter of opinion to decide this great question, but rather that it rests upon the cold mathematical facts. However, we feel kindly disposed as a commercial body to the granting of this increase in rates on the general principles that you cannot reasonably expect the roads to meet a twenty-five per cent increase in operating expenses on the old rates. The increased price of labor alone would warrant a change in freight rates.

Secretary, Louis H. Conger, Muskegon Chamber of Commerce. (Population 24,062.)

This organization has not as yet adopted any attitude on the proposed increase of freight rates. Muskegon is a city of large shipping interests, and those who make good use of the transportation facilities feel that any increase in rates which will be productive of better service, is entirely warranted. We do not, however, believe in any increase which will pay interest or wipe out funded debt incurred through stock watering and other high financing.

Mayor of South Milwaukee. (Population 6,092.)

(1) I personally believe the five per cent advance is a good move.

(2) My own opinion is, that it should be granted at once, judging from the reports of the railroads in this vicinity.

Mayor Geo. H. Arnold of Three Rivers. (Population 5,072.)

(1) I think that the sentiment of this community is in favor of fairness and will leave the settlement of the matter to Government officials.

Mayor of Waukesha. (Population 8,740.)

(1) Yes.
(2) Yes.

REPLIES OF AN UNFAVORABLE CHARACTER.

Mayor A. W. Chase of Adrian. (Population 10,763.)

(1) No. The feeling is very much against granting an increase in rates.

Mayor S. Harper of Bay City. (Population 45,166.)

(1) No.

Mayor James Johnston of Cadillac. (Population 8,375.)

(1) No.

Fred W. Green, Mayor of Ionia. (Population 5,030.)

(1) It is my belief that the sentiment of the business men of our city is very much opposed to any increase in freight rates until we know the actual value of the railroads.

REPLIES INDICATING UNCERTAINTY OR DIVIDED OPINION.

Secretary, John F. Wilkinson, Alpena Chamber of Commerce. (Population 12,706.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, Chas. W. Ward, Battle Creek Chamber of Commerce. (Population 25,267.)

No resolution has been passed by our Board of Directors regarding the proposed increase in freight rates. While our directors may be favorable to making such concession to the railways, they are not sure that the sentiment of the community, which a resolution from this purport would express, would really justify their taking action favorable to the proposition.

Mayor of Fond du Lac. (Population 18,797.)

(1) I believe the Interstate Commerce Commission entirely able to determine the case referred to.

Secretary, Ironwood Commercial Club. (Population 12,821.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, Paul A. Leidy, Jackson Chamber of Commerce. (Population 31,433.)

No action for or against the increase of five per cent in freight rates in Official Classification territory has been taken by this organization or by its Transportation Committee.

Secretary, F. C. Butler, Kalamazoo Commercial Club. (Population 39,437.)

Our Club has taken no action upon the proposed increase in freight rates, other than to protest to the Interstate Commerce Commission against advancing four specific rates which we consider excessive as compared with rates on the same commodities to other points. I believe I speak the sentiment of all members when I say we do not object to the five per cent increase, providing the railroads prove to the satisfaction of the Interstate Commerce Commission that the increase is necessary.

Secretary, Henry C. Hutton, Ludington Board of Trade. (Population 9,132.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, Clifton D. Jackson, Mount Clements Business Men's Association. (Population 7,707.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Mayor of Rhinelander. (Population 5,637.)

(1) My opinion is that the Interstate Commerce Commission should go into the details of the cost of operation, maintenance, etc., and then render their decision accordingly.

John G. Straub, Mayor, Traverse City. (Population 12,115.)

(1) I presented your letter at a meeting of our business men but could not get any action in the matter.

Mayor, Wyandotte. (Population 8,287.)

(1) So far as I can observe there has has been no expression of sentiment one way or the other.

INDIANA.

REPLIES OF A FAVORABLE CHARACTER.

Mayor Frank Callahan of East Chicago. (Population 19,098.)

(1) It is my belief that a large majority of the business men of this district, knowing as they do, that the cost of operating their own business has materially increased in the last few years, and believing also that

the cost of operating railroads has increased in the same proportion, that the proposed increase of five per cent should be granted to the carriers, and that the failure on the part of the Government to grant such increase, has created depression in all lines of business.

Mayor T. E. Smith of Elkhart. (Population 19,-282.)

(1) Business men and others believe that the railroads should be allowed to increase their freight rates as everything they employ in operation has increased in cost. Their request is considered by our citizens but just.

(2) The increase should be promptly granted, leaving for future consideration, such other matters as you refer to.

Indiana Bituminous Coal Operators' Association of Terre Haute.

This organization has addressed the Interstate Commerce Commission strongly urging them to grant the railroads an increase in freight rates on all commodities including coal.

Secretary, M. E. Crites, Indiana Harbor Commercial Club.

On January 23d, we sent a notice to the Interstate Commerce Commission advising them of the fact that our organization is in favor of granting to common carriers their petition for an increase of five per cent of their present freight rates. Our organization represents all classes of shippers from steel manufacturers to small retailers.

Secretary, Wm. H. Howard, Indianapolis Board of Trade. (Population 233,650.)

The following resolution has been adopted at a meeting of the Governing Committee of the Board of Trade of Indianapolis:

Resolved, That the Indianapolis Board of Trade refrain from opposition to the proposed increase of five per cent in freight rates, if the Interstate Commerce Commission decides it to be just.

Secretary, John Hauck, Indianapolis Building Contractors' Association and Builders' Exchange.

Our Association has taken no official action in this matter. However, in canvassing the situation, several of our members have expressed themselves as looking with favor on the efforts of the railroads to obtain an increase in rates.

Albert V. Weigel, Secretary, Lafayette Commercial Club. (Population 20,081.)

The Lafayette Chamber of Commerce has unanimously adopted a resolution favoring the granting of the increase in freight rates to the railroads by the Interstate Commerce Commission. The resolution was preceded by a preamble which stated in brief:

That the industrial progress of the country depended largely upon the progress of the railroads; that we realize that the railroads have suffered from high handed methods of financing and, in some instances, mismanagement; that they are not always operated to the greatest possible efficiency, and that the public has been the greater sufferer from these faults; but that, nevertheless, we believe that the railroads are coming to realize a greater obligation toward the public, and that the granting of the increase will help them in their desire to reach a greater efficiency and give better service.

The resolution was as follows:

Resolved, That the Lafayette Chamber of Commerce respectfully petitions the Interstate Commerce Commission to grant the request of the railroads for a five per cent increase in freight rates during such time as will in the judgment of the Commission enable the railroads to make their necessary improvements, thereby contributing greatly to the welfare of the country.

It is the sense of this Chamber of Commerce that the increase in the freight rates will not place a burden of any appreciable extent on any customer, and that the granting of the request will give a stimulus not only to the railroads but to its allied industries and the country at large.

A. E. Werkhoff, Secretary, Lafayette Retail Merchants' Association. (Population 20,081.)

While we have talked this matter over, as an organization we have made no ruling and have taken no action but are willing to abide with whatever action or rulings our organization sees fit to advance. We understand that the Lafayette Chamber of Commerce has made a ruling in favor of the proposed increase in freight rates.

Mayor Frank V. Guthrie of Logansport. (Population 19,050.)

(1) This city is a railroad center and, in my opinion, is in favor of such increase.

(2) Yes.

Logansport (Ind.) Republic, December 27, 1913.

But aside from these questions, it is likely that the majority of conservative men will agree that the five per cent increase is not excessive and is needed by the road under the increased cost of maintenance.

Secretary, H. R. Irhie, Terre Haute Chamber of Commerce. (Population 58,157.)

The following resolutions have been passed by the Terre Haute Chamber of Commerce relative to the proposed increase in freight rates now pending before the Interstate Commerce Commission:

Whereas, The railroads in the so-called Official Classification Territory have filed with the Interstate Commerce Commission a proposal for a general advance of five per cent in freight rates, and

Whereas, The question is now up for hearing before the Interstate Commerce Commission, and

Whereas, Long continued uncertainty as to the final outcome will be detrimental to the commercial activities of the country, now, therefore, be it

Resolved, That the Board of Directors of the Terre Haute Chamber of Commerce favors a horizontal increase of freight rates in Official Classification Territory, but opposes the proposed increase of ¼c per 100 lbs. minimum or five cents per ton. And be it further

Resolved, That a copy of these resolutions be sent to the Interstate Commerce Commission.

REPLIES OF AN UNFAVORABLE CHARACTER.

Mayor of Bedford. (Population 8,716.)

(1) The sentiment of this community is decidedly against the increase.

Samuel F. Spohn, Mayor, Goshen. (Population 8,514.)

(1) So far as it can be asserted the general sentiment of this community is opposed to the five per cent increase in freight rates. The ratio being about three to one in opposition.

Commissioner J. Keary of Freight and Traffic Division, Indianapolis Chamber of Commerce. (Population 233,650.)

Last May a conference was held in Indianapolis between a committee of executive traffic officials of the carriers and committees representing the Board of Trade and the Chamber of Commerce, at which this proposed increase in rates was discussed. Later the subject was considered by the Executive Committee of this Chamber and the conclusions reached are expressed in the following resolution:

> Resolved, That as to interstate rates, the Indianapolis Chamber of Commerce has moved to oppose the proposed advance until the question has been submitted to and determined by the Interstate Commerce Commission, embracing in their investigation the factors of cost of handling and efficiency and economies in operation.

Mayor of Madison. (Population 6,934.)

(1) No.

Secretary, Business Men's Club, Muncie. (Population 24,005.)

The general attitude of our Club is against the proposed advance. Of course, there is some diversity of opinion.

Mayor of New Castle. (Population 9,446.)

(1) No.

Mayor of Terre Haute. (Population 58,157.)

(1) No.

REPLIES INDICATING UNCERTAINTY OR DIVIDED OPINION.

Secretary, Wallace B. Campbell, Anderson Commercial Club. (Population 22,476.)

No action has been taken by this organization for or against the proposed increase of five per cent i nfreight rates in Official Classification territory.

Secretary, H. R. Isenhower, Bloomfield Commercial Club.

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, W. N. Achenbach, Columbus Commercial Club. (Population 8,813.)

No action has been taken by this Club for or against the increase of five per cent in freight rates in Official Classification territory.

Secretary, Frank B. Riller, Crown Point Business Men's Association. (Population 2,526.)

No action has been taken by this Association for or against the proposed increase of five per cent in freight rates in Official Classification territory.

J. C. Keller, Secretary, Evansville Business Men's Association. (Population 69,647.)

No action has been taken by the organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, J. C. Keller, Evansville Manufacturers' Association.

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, Chas. W. Foulks, Goshen Commercial Club. (Population 8,514.)

Our organization has not even discussed this matter and we do not know the attitude of our members. The railroads should, however, be given favorable conditions for improper returns on investments cripple or hamper them, and naturally means a curtailment in expenses.

Secretary, Greencastle Commercial Club. (Population 3,790.)

No action has been taken by our members. Personally, I feel that the railroads must make money to enable them to give the public good service. We do not feel competent, however, to say what rates are reasonable and just.

R. E. Parks, Secretary, Hobart Commercial Club.

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

A. K. Grant, Mayor, Mount Vernon. (Population 5,563.)

(1) I find the sentiment among business men here about equally divided.

Secretary, P. M. Crume, Peru Commercial Club. Population 10,910.)

There has been no direct action taken by this organization. There has been some talk for and against the increase, but the general opinion appears to be to let matters take their course.

Secretary, South Bend Chamber of Commerce, D. Brickell, Acting Secy. (Population 53,684.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Percy L. Sisson, Mayor, Valparaiso. (Population 6,987.)

(1) The sentiment on this subject has not been generally expressed in our community and I am therefore unable to intelligently answer your question.

James M. House, Mayor, Vincennes. (Population 14,895.)

(1) I am satisfied that the business men of this city, like myself, do not have the necessary information to enable them to make an intelligent answer to this question.

INDIANA EDITORIAL COMMENT.

Ft. Wayne (Ind.) Sentinel, November 29, 1913.

Particularly for a great railroad center like Fort Wayne, the present plea of the railroads for the right to increase freight rates in practically all classes has very great interest. The railroads have participated so largely in the building and development of this city that there will here be found not only a public sentiment disposed to be absolutely fair in the proposition, but even still more kindly disposed toward the railroads if they are able to present satisfactory evidence of the justice of their demands.

Gary (Ind.) Tribune, December 10, 1913.

The time has come when the Interstate Commerce Commission, voicing the interests of the nation, must recognize the great fact that our railroad corporations, with all the disagreeable facts of the past are as they are, and cannot be changed now. With growing demands by their employes and the loud calls of the public for better service and a smaller toll of dead and injured, on the basis of their present incomes they are up against it, and when they are in such dire straits, the people they serve are also up against an intolerable proposition.

If the people insist upon the present railroad rates, they must take what they get in service and safety. There is nothing else to be done.

Gary (Ind.) Tribune, January 2, 1914.

Every indication of coming events indicates that the Interstate Commerce Commission is going to grant the railroads an advance in rates. The manufacturers, who were so strong against the advance the last time it was up, are now silent. The big newspapers are solidly in favor of the advance. The trend is all that was, and it seems only a question of a short time before the Commission will act.

The change in sentiment during the past three years has been remarkable. During that period, the public has been demanding more of the transportation companies year by year. Better service, steel coaches, safety appliances, block signals, higher wages and heavier taxes have all added to the expense of operation without a corresponding increase in earnings.

The railroads have gone to the limit, it seems, in these directions without being given a larger income.

Indianapolis (Ind.) News, May, 1913.

Rate restrictions imposed by the Interstate Commerce Commission and capital restrictions which will be the result of the physical valuation soon to be undertaken do not allow the railroads wide latitude. They can not increase their expenditures beyond reason without being expected to seek recompense in higher revenue.

Indianapolis (Ind.) Star, December 23, 1913.

The position taken by the railroads that they ought to be permitted to figure the costs of protection into their service charged is fundamentally sound. No business can survive on a profitable basis unless it adjusts its charges to the costs of production. The only consideration that might change a universal rule in its application to railroads would be a possibility of abnormal profits on actual investment, or the carrying of fictitious capitalization.

NEW JERSEY.

REPLIES OF A FAVORABLE CHARACTER.

Mayor John J. Todd of Morristown. (Population 12,507.)

(1) Yes.

(2) Yes.

Secretary, R. E. Lent, Passaic Board of Trade. (Population 54,773.)

The Passaic Board of Trade recently held a referendum on the question of the five per cent increase in freight rates and the vote cast was 215 in favor of the increase and only 9 against it. The following letter was sent to the various members of the Board of Trade, calling their attention to the referendum which was decided in the manner above indicated:

To Members of the Board of Trade:—

Dear Sirs:

In order to determine the sentiment of the business men of Passaic on important matters affecting their interests, the Directors of the Board of Trade have decided to inaugurate a system of referendum among the Board members.

The first subject to be put to referendum, as decided at a meeting on December 18th, is the matter of increased freight rates. This subject is one of very vital importance to every business man in the country. The prosperity of almost every business is related either directly or indirectly to the railroads. If the railroads are prosperous, business throughout the country is apt to be good; if the railroads are not prosperous, business throughout the country is apt to be poor. It is the claim of the railroads that an increase in rates is absolutely necessary to their continued prosperity.

When the Interstate Commerce Commission hands down its decision, it will unquestionably be guided, to a very large extent, by public opinion. It is therefore, imperative that we, of Passaic, should go on record, either as opposing or recommending the increase.

The Board of Trade's Committee on Manufacturing has carefully considered the arguments pro and con, and is of the belief that the increase should be granted. A statement in brief of the principal arguments considered is enclosed herewith. A postal, which will serve as a ballot, is also enclosed. Please indicate whether you wish your vote recorded "in favor" of the recommendation of the committee, (i. e., in favor of the increase in rates) or "opposed to" the recommendation of the committee. Mail the postal, as soon as possible. to R. E. Lent, Secretary of the Board of Trade. No vote will be counted unless received within seven days from date.

Very truly yours,
F. WILCKES,
Chairman of Committee on Manufacturing.

Mayor Robt. G. Wymer, Jr., of Salem. (Population 5,533.)

(1) Yes. The sentiment hereabouts is best expressed by the following editorial taken from the *Salem Sunbeam*:

About the only thing that seems to be needed, according to those who have made the subject a special study, to make business hum all over our land is to have the Interstate Commerce Commission give the railroads authority to raise their freight and passenger rates. Rates that were liberal a few years ago are not so now, the higher cost of all materials entering into railroad construction and operation and the higher wages now paid to all employes of the roads having so depleted the revenues of all railroad corporations that extensions needed to get the business of new territory and increased and bettered equipment to handle present traffic are altogether out of the question, while some roads have been compelled either to pass temporarily their dividends or to make reductions that are embarrassing to their stockholders. A little easier money in the treasuries of the railroads would make more business and easier money everywhere.

Secretary, State Chamber of Commerce.

The following extract is from a letter forwarded from the New Jersey State Chamber of Commerce to the Interstate Commerce Commission on July 18, 1913:

On June 11, 1913, the transportation committee of the New Jersey Chamber of Commerce submitted to a referendum vote its proposal to support a movement which might tend to increase the earnings of the railroad systems of the country. As a result 98 per cent of our members approved the proposal.

It is the belief of the New Jersey State Chamber of Commerce that there are many apparent reasons favoring the contention of the railroads of this country that they should be allowed a larger margin of earnings in order to insure proper service and maintenance and that this would result in a general business expansion. The Chamber further believes that the restoration of financial credit and the opportunity thus afforded to grow and expand would work a benefit to every industrial city in the United States.

Mayor Henry W. Evans of Westfield. (Population 6,420.)

(1) I believe that our people would be favorable to the increase.

REPLIES OF AN UNFAVORABLE CHARACTER.

Henry J. Grig, Mayor, Millville. (Population 12,451.)

The sentiment is that freight rates are high enough.

REPLIES INDICATING UNCERTAINTY OR DIVIDED OPINION.

Secretary, W. B. Dill, Atlantic City Chamber of Commerce. (Population 46,150.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

President, J. W. Moore, Bayonne Civic Association. (Population 55,545.)

No definite action has been taken by this Association on the subject of increased rates. For your information, I am at liberty to state that under normal business conditions, our Association would not only have advocated the proposed increase, but would also have given every possible assistance to the movement.

Secretary, Hoboken Business Men's Association. (Population 70,324.)

No action has been taken by this Association for or against the five per cent increase in freight rates in Official Classification territory.

Secretary, Daniel Doran, Long Branch Chamber of Commerce. (Population 13,298.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, James M. Reilly, Newark Board of Trade. (Population 347,469.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, John J. Fitzgerald, Paterson Board of Trade. (Population 125,600.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, Hugh Lynch, Perth Amboy Board of Trade. (Population 32,121.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, M. S. Sherwood, Summit Board of Trade. (Population 7,500.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, C. Arthur Metzger, Trenton Chamber of Commerce. (Population 96,815.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

NEW JERSEY EDITORIAL COMMENT.

Elizabeth (N. J.) Journal, November 26, 1913.

Judging from the comment of newspaper and current magazine editors, the public generally is not unfavorable to the proposed increase. It is realized that the railroads are securing a margin of profit in recent months far too small to allow them to make such improvements as are necessary to facilitate the convenience and insure the safety of their patrons.

While wages, operating expenses and taxes have increased to a marked degree, as shown by the reports of experts testifying for the railroads, the net operating income of the roads interested has been far less than previously.

While the public generally expects to pay out of its pocket this added increase of rates, it does not complain if it knows that the increase is justified and the income from it is to be used in increasing the service of the roads, promoting improvements that shall enable them to better care for the interests of the communities they serve and to safeguard the welfare of their patrons.

The public has a better understanding with railroads than ever before and is willing to allow adequate rates for service, but not increased rates to fatten dividends.

Paterson (N. J.) Press, January 8, 1914.

An impression that the Government has been handing out rather too hard lines to the railroads in the regulation of freight rates without regard to the increased expenses they have been called upon to bear, and their ability to make the extensions and betterments of service that are needed, is indicated by the recent action of important commercial and manufacturing associations, particularly in the West. The Manufacturers' Association of Illinois, which was for a while one of the most energetic in opposing the movement of the railroads for increased rates, has just come out with a strong appeal that the advance be granted in order "that present service for the shipper may be maintained and improved." Another evidence of the change in sentiment is seen in the action of members of the Chicago Board of Trade—mainly composed of shippers—in circulating a petition to the Interstate Commerce Commission to grant the advance asked for. These facts suggest that many business interests that were formerly antagonistic have discovered that they cannot be prosperous unless the railways are permitted to prosper.

Perth Amboy (N. J.) Evening News, May, 1913.

It is not surprising that the railroads have announced their intention of asking the Interstate Commerce Commission for the right to increase rates, and we believe the public will sanction granting the same.

WISCONSIN.

REPLIES OF A FAVORABLE CHARACTER.

Secretary, Frank E. Lane, Janesville Commercial Club. (Population 13,894.)

There is considerable difference of opinion between some of our members. However, personally, I feel that the tendency would favor an increase in Official Classification territory, as rates in this section are considerably lower than in the Western Classification territory.

Secretary, Conrad Shearer, Kenosha Manufacturers' Association. (Population 21,371.)

The following resolutions, passed on July 11, 1913, by the Manufacturers' Association of Kenosha, indicate the attitude of this body towards the proposed increase of five per cent in freight rates in Official Classification territory:

Whereas, It has been represented that an increase in freight rates is necessary in order that additional equipment be provided and facilities improved. That such increase will result in benefits to shippers throughout the country,

Therefore, Be It Resolved, That the Manufacturers' Association of Kenosha, through its duly authorized officials, does hereby approve of such action on the part of the Interstate Commerce Commission as will permit an increase of freight rates by the railroads through an equitable adjustment, fairly distributed with the end in view of providing adequate service to the shipping public.

Resolved, That a copy of these resolutions be forwarded to the proper authorities and one kept on file in the offices of the Association.

Manufacturers' Association of Kenosha,
(Signed) W. W. Vincent, President.
(Signed) Conrad Shearer, Secretary.
Kenosha, Wis., July 11, 1913.

R. W. Barrett, Secretary, Merrill Chamber of Commerce. (Population 8,689.)

Our organization has passed no resolutions with reference to this matter. In speaking with a number of our directors, however, I can safely say at this time that they are in favor of a legitimate increase in freight rates. As a general rule when the railroads are prosperous, the country's condition is prosperous.

William G. Bruce, Secretary, Merchant's and Manufacturers' Association of Milwaukee. (Population 373,857.)

We have placed ourselves on record on the question of the proposed advance in freight rates, as follows:

> The capital invested in railroads is entitled to a reasonable return. The public is entitled to an efficient service by the hands of the railroads. The Interstate Commerce Commission should investigate the question of an advance in railroad freight rates and if such an advance is warranted by the facts and conditions, the advance should be made.

Milwaukee (Wis.) Wisconsin, December 10, 1913.

No wonder that the railroads are facing the calamity of inability to "make both ends meet." No wonder that fair minded men who have studied the situation are in favor of the granting by the Interstate Commerce Commission of the application of the Eastern roads for permission to raise their freight rates five per cent.

Secretary, W. A. Lesson, Ripon Commercial Club. (Population 3,739.)

This Club has passed no resolution to increase freight rates or has the matter been discussed, but in conversation with our leading men I find they are of the opinion that the railroads should receive a rate which would cover their expenses and give them a fair profit on money invested. On the face of the matter such a condition does not seem to exist.

J. A. Little, Chief Statistician, Superior. (Population 40,384.)

Answering your inquiries in the order in which they were made, I will say that the sentiment of the business people of the city and the press of the city seems to be quite unanimous in the position that the railways of this country are entitled to earn an amount sufficient to take care of operating expenses, taxes, fixed charges, fair dividends on the value of the property, and in addition, a reasonable surplus from which improvements of a minor character or non-revenue producing improvements can be made, providing, however, that such improvements made from surplus revenue, shall not be capitalized in the future and be made the basis for an increase in the rate of freight or fares for passengers.

Of course no business man or organization of business men would favor an increase in rates, if it can be shown that there is any great inefficiency or wasteful operation of the roads or that the necessity for such increase arises from mismanagement of the property or its financing. It certainly must be incumbent upon the carriers to clearly show that the additional moneys are needed to meet the fair requirements of the property, which has been efficiently and economically managed.

I may say that while this statement is a very fair one as to the question of advances in all rail rates, that there is a decided sentiment against any advances in the lake and rail rates from Eastern territory to the head of Lake Superior and this port.

The history of the all-rail rate structure will show that the general level of all-rail rates has been maintained at about the same figure with a great many reductions during a period of say twenty years, while the charges for lake and rail shipments have been advanced several times, narrowing the difference between the lake and rail and all-rail rates. Because of such prior advances in the lake and rail rates as compared with the all-rail adjustment, it is believed that there should be no advance in lake and rail rates at this time.

As to the second inquiry, the writer can see no objection to a speedy determination of this question on its merits, and a prompt granting of the request for advanced rates if the Commission shall find the carriers are entitled to such increase in rates.

As I understand the terms of the Mann-Elkins law, governing the Commission in this investigation of advanced rates, the Commission may allow an increase in general schedules of rates, without such action precluding the Commission from further considering the question of individual rates, either from the standpoint of reasonableness where such rates are affected by special conditions, or where the increase may have resulted in unjust discriminations prohibited by other sections of the law. This would, at least in theory, allow a shipper who was injured in some special instance, to bring a complaint before the Interstate Commerce Commission to test the reasonableness or establish the discriminatory character of the advanced rate.

As to the question of national regulation of railway securities it is my opinion that it is not necessary that such regulation should precede the determination of the advanced rate case or the granting of such advances on proper showing. The Interstate Commerce Commission and the courts have never taken the amount of outstanding securities as the basis upon which the railways are entitled to earn a fair return. It would seem to the writer as if this question of regulation of securities issue, is a proper subject for separate consideration from the question of advanced rates.

Traffic Manager, A. E. Solie, Wausaw Advancement Association. (Population 16,560.)

This organization has not as yet passed any resolutions with regard to the proposed five per cent increase in freight ratės now pending before the Interstate Commerce Commission, although the matter has been given more or less consideration. However, the writer is in a position to say at this time that we have no objection to the five per cent increase in freight rates on the condition that we can get a readjustment of freight rates on all classes of commodities from this territory.

REPLIES INDICATING UNCERTAINTY OR DIVIDED OPINION.

J. B. Fleming, Mayor, Eau Claire. (Population 18,310.)

(1) No; nothing has taken place here which could lead me to such a conclusion.

R. F. Kaiser, Pres., Eau Claire Business Men's Association.

No action has been taken by this organization for or against the proposed increase in freight rates in Official Classification territory.

Secretary, A. M. Richmond, Evansville Commercial Club.

No action for or against the rate increase has been taken by this organization.

Secretary, Fond du Lac Business Men's Association. (Population 18,797.)

No action for or against the rate increase has been taken by this organization.

G. A. Bading, Mayor, Milwaukee. (Population 373,857.)

(1) Your request has been referred to the Secretary of the Merchants' and Manufacturers' Association.

Secretary, H. A. Rhunb, Milwaukee Chamber of Commerce.

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, E. B. Heimstreet, Palmyra Business Club.

No action has been taken by our Business Club on this subject. In fact, we have been waiting for opinions from the larger clubs before taking any action ourselves.

Secretary, Walter R. Frann, Waukesha Business Men's Club. (Population 8,740.)

No action has been taken by our Association, but I know many are in favor of the carriers being allowed an increase in rates.

MARYLAND.

REPLIES OF A FAVORABLE CHARACTER.

Secretary, James B. Hessong, Baltimore Chamber of Commerce. (Population 558,485.)

The following report of the Traffic Committee of the Baltimore Chamber of Commerce to whom referred the petition of the railroads for an increase of five per cent in their freight rates was unanimously adopted by the Board of Directors of this organization at a special meeting held May 17, 1913:

> It is believed, from the statements of the representatives of the railroads, that the advance is absolutely necessary, and that the increased revenue derived therefrom will be equitably applied to the enlargement and development of terminals, additional equipment, also improved and increased facilities, and that the advance will not result in undue discrimination against localities or commodities. Therefore, the Traffic Committee approves the proposed advance in rail freight rates, and respectfully recommends that you endorse the carriers' application to the Interstate Commerce Commission for the increase in rates, as set forth by the railroads.

Secretary, Jno. W. Marshall, Old Town Merchants' and Manufacturers' Association, Baltimore.

At the regular January meeting of the Old Town Merchants' and Manufacturers' Association, the following resolutions were unanimously adopted:

> Resolved, That the Old Town Merchants' and Manufacturers' Association of Baltimore puts itself on record as favoring the request of the railroads to the Interstate Commerce Commission, for permission to increase freight rates five per cent.
>
> Resolved, That we believe that the increase is justifiable as it will enable the railroads to give improved service and better facilities to their shippers and will prevent that depression of their bonds and stocks that causes such unrest in the financial world.
>
> Resolved, That a copy of these resolutions be sent to the Interstate Commerce Commission of the United States.
>
> Very truly yours,
>
> Jacob W. Cook, President.
>
> John W. Marshall, Secretary.

Mayor George G. Young, of Cumberland. (Population 21,839)

(1) Yes.

(2) Yes.

Secretary, Lloyd T. MacGill, Frederick Board of Trade. (Population 10,411.)

On December 12, 1913, our Board of Trade unanimously passed a resolution endorsing the proposed advance of five per cent in freight rates. I think you will find that our organization was the first in the United States to take action favorable to the railroads.

MARYLAND EDITORIAL COMMENT.

Cumberland (Md.) Times, December 19, 1913.

The railroads of the country are making an appeal to the Interstate Commerce Commission for the privilege of increasing their rates. This request should be granted. The "Baltimore Sun" in an editorial explains why the railroads should be allowed to change their rates.

For these reasons we favor the granting of increased rates to the railroads. And we would like to see them granted at the earliest possible moment.

Baltimore (Md.) Evening Star, November 24, 1913.

There seems to be no room for doubt concerning one phase of the general railroad situation as compared with the general situation of, say, five years ago. There can be no disputing the fact that the operating expenses of all railroads have increased greatly during the past five years because of the general increase in the monthly pay of all grades of employes.

Baltimore (Md.) Evening Star.

The one compelling reason why the increase should be allowed is that nearly every road in the East faces an actual and growing loss due to the immensely increased costs of operation, brought about principally by the substantial additions to the payrolls resulting from the widespread increases in pay obtained by the employes on the lines generally during the last two years. At the same time other costs—those for rails, equipment, upkeep and the like—have likewise increased, although not proportionately.

If the roads are compelled to support an annual deficiency on the income side trade cannot be effectively done. The need of relief is an immediate one, not one relating to future betterments.

Baltimore (Md.) Manufacturers' Record, June 19, 1913.

"The railroads of the country, by force of public sentiment and of economic conditions, have been compelled year after year to increase the rate of wages of their employes; nearly everything they have had to buy, from oils to locomotives, has been advanced in price; indeed, the 'high cost of living' is just as vital to every railroad in the country as it is to every individual. It is costing more to operate railroads, more to equip them, more to provide the facilities which the public demands. They are practically being regulated out of existence without the privilege of increasing their income to a sufficient extent to save themselves. Unless a complete change comes about in the very near future and railroads are given the privilege of making larger earnings by higher rates, this country will be compelled to see a complete breakdown of the whole railroad system of the land, or else to take over all of our railroads, with the enormous indebtedness which that would bring about, and the utter collapse of our system of government which would follow. The stone wall faces us. We cannot butt it down; we cannot crawl underneath nor climb over it. We must find a way to remove it. That stone wall is the misunderstanding of the railroad situation which has existed throughout our country for some years. Too many people have been made, by honest but misguided men and by dishonest demagogues, to believe that they and the country would get rich by destroying the railroads, or by reducing freight and passenger rates to the lowest possible limit. This hostility is largely due to the conditions which prevailed in the railroad world fifteen or twenty years ago, when the building of speculative railroads for the purpose of carrying securities, rather than for the carrying of traffic, was the order of the day. Long ago we passed out of that period, and for many years most of the railroad managers of this country have been earnestly striving to operate railroads with just as much honesty as private business interests are managed. They sought to find a way to give to the public the improvements demanded for freight and passenger business. They have seen and realized more than any one else the difficulties which confronted them. They have seen the lessening of their ability to increase their facilities in keeping with the growth of the country. The public, however, has not yet come to a full realization of the danger of the situation that exists to-day. It does not yet fully understand how a breakdown of the railway system of the country would demoralize every industry and interest in the land.

"We are hastening to the time when every interest in the country will be endangered and losses produced which will run into billions unless we can find a way to put our railroad interests on a sounder and safer basis, where their income can be increased and when the $8,000,000,000 or $10,000,000,000 that ought to be spent upon railroad expansion in the next ten years can be provided. This is not a theory. We are face to face with facts of tremendous significance. We can only save ourselves and our business interests by finding a way to vastly increase railroad earnings and to put railroad securities on some safe and sound basis that billions of dollars may be poured into investments in the building of new roads and the expansion of existing lines. Unless we do that we shall see, as surely as we see the sun rise, a breakdown of business because of a breakdown of the machinery of doing business, viz., transportation."

Baltimore (Md.) Manufacturers' Record, December 28, 1913.

It should be borne in mind that every wheel that turns is being worn out, that every rail over which an engine or a car runs is being weakened and worn, that every roadbed not kept up to the highest mark is deteriorating, and that it will be impossible to avoid these conditions without a large increase in the net income of railroads. Present conditions endanger the lives of men who travel, and practically everybody is a traveler. Present conditions make it impossible for the railroads to handle all freight economically and expeditiously even now when business is inactive.

Were business as active as in times past, practically every railroad in the country would be broken down and unable to handle its traffic. If it were possible to inject into the treasury of the railroads of this country the billions of money needed for the enlargement of their facilities, we would very soon have such activity in railroad work and railroad expansion as would bring about a revival of business throughout the country and an enlarged demand for labor, and this, too, without regard to tariff or other adverse conditions. A great stimulation to railroad building would promptly stimulate every other industry in the country, and the men who would pay the slightly increased freight rate would by this greater activity of business many times win a larger profit than the added cost of freight. Every man, who, if the matter were up for public vote, voted for an increase in railroad rates would be voting much more largely in the interest of his own prosperity than in the interest and the prosperity of the railroads.

Baltimore (Md.) News, May, 1913.

The aggregate lien representing the demands of all three classes of employes would approximate $1,000,000,000. And the service remaining the same, the public interest in the issue would not be very different from what it would be were the railroads proposing to water their capital by declaring a stock dividend of exactly the same amount of four per cent first lien securities. In such a case the public would very naturally assume that it itself would have to pay the shot. How could it expect to escape doing so if the interest on that same amount of capital were merely distributed to employes instead of to stockholders?

Baltimore (Md.) News, May, 1913.

"Prosperity for the railroads, from the nature of the case, cannot mean mere profit-taking. It means an ever-increasing necessity to expand their equipment and organization to take care of increased business if they are to keep up with the procession. Indeed, if they are managed in the most enlightened way, larger receipts impose the necessity for larger expenditures to anticipate the future. For them, living from hand to mouth is little better than suicide.

"But, in another aspect of the problem, the shippers are only part of the body-politic which has undertaken to impose burdens on the railroads through awards of higher wages by means of public arbitration, and through requirements of better equipment and service imposed by the Interstate Commerce Commission. There is now, for the first time, an implied obligation to permit the rates to conform with larger expenditures."

Baltimore (Md.) Sun, May, 1913.

By reason of their general good behavior in the last few years, the roads have created a public sentiment that will insure them a fair hearing and an unbiased consideration of their plea. No one nowadays is disposed to deny their right to a fair share in the prosperity of the country.

Baltimore (Md.) Sun, November, 1913.

"We have included the Interstate Commerce Commission in the list of those from whom prompt and frank action is demanded, because we strongly believe that the most important step of all toward immediate business prosperity is the granting of the request of the railroads for increased freight rates. We have many times stated our reasons for this belief, but at this time will only mention one fact, one brought out at the recent hearing before the Interstate Commerce Commission. Since 1910 the Pennsylvania Railroad has increased its property investment by $207,000,000. The net income, however, instead of keeping pace with the enlarged investment was actually $11,000,000 less in 1913 than in 1910. Nor was the Pennsylvania Railroad an exception. During the three years in question all the roads included in the number which now ask an increase of rates added $659,000,000 to their property investment, but the net income of all of them was $16,000,000 less in 1913 than in 1910. Explain this as you will, no one is going to invest in railroad properties so long as this situation continues. Yet until the railroads do get the money to enable them properly to take care of the business that is offered them there can be no revival of business. This is fundamental."

Baltimore (Md.) Sun, December 18, 1913.

Perhaps others of "The Sun's" readers than the "Ultimate Consumer" whose letter appears elsewhere on this page to-day, are bothered to know why a paper like "The Sun," "which has been an undoubted champion of the people's rights, has so vigorously joined in the hue and cry for an increase of freight rates." We are glad to tell them why.

It is because we are championing the people's rights in doing so.

We are not concerned about the railroads. Their prosperity or adversity is of small moment except in so far as it affects the prosperity of the whole people. The old illustration of the row of upstanding bricks is perhaps the best and truest one that can be applied to the present business situation. If you push down the railroad brick it falls against the steel brick; the steel brick hits and knocks over the coal brick; the momentum of these three upsets the retail trade brick, which over turns the wholesale trade brick, and all of them throw down the professional brick. Thus the falling of one causes the falling of all.

Baltimore (Md.) Sun, December 24, 1913.

It is a little difficult to understand why it should be necessary for the Commission's members now to drag out their hearings over several months of time, as it has been said in some quarters that they will do. Do they not know now about as much as they will know on the first of May? Will anything that can happen between now and that time change their minds? In view of the apparent urgency of the situation, would they not do well to make their decision with the utmost promptness?

WEST VIRGINIA.

REPLIES OF A FAVORABLE CHARACTER.

Mayor F. M. Peters of Bluefield. (Population 11,188.)

(1) Yes; we feel that owing to the increases in wages granted employes by the railroads and other increases in expenses, including advanced cost of operation and and maintenance, it is only fair that the small increase in freight rates requested should be allowed.

(2) Yes; we feel that the matter ought to be settled now, and believe it will stimulate business when allowed.

Mayor of Fairmont. (Population 9,711.)

(1) I think our community favors the increase.

(2) Yes.

Mayor Cornelius Watkins of Grafton. (Population 7,563.)

(1) The city depends upon the railroads

very largely for the employment of its skilled and unskilled labor, and local business men having suffered by reason of cuts made in the number of local railroad employes, there is a considerable feeling favoring the proposed increase.

(2) Yes.

J. G. Allender, Secretary, Grafton Merchants' Association. (Population 7,563.)

With reference to the attitude of the Merchants' Association concerning the proposed increase in freight rates, I desire to call your attention to the following resolution which was passed by this organization on January 27th:

"*Resolved,* That this Association is in favor of the proposed increase in freight rates as embodied in the petition of the railroad companies now pending before the Interstate Commerce Commission."

Mayor Floyd S. Chapman of Huntington. (Population 31,161.)

(1) Our Chamber of Commerce has already adopted resolutions favoring the increase.

(2) Yes.

Secretary, H. E. Mathews, Huntington Chamber of Commerce.

As the appended resolution indicates, the business men of Huntington are in favor of permitting the carriers in Official Classification territory to increase their freight rates five per cent. In commenting on the effect of this resolution, the Secretary of the Chamber of Commerce states: "It gives me pleasure to add that we have received many congratulations on our action in passing this resolution by those who were not able to be present at the meeting, and it is the consensus of opinion of our people in general, that the railroads' petition to increase their rates in Official Classification territory be granted. Being secretary both of the Chamber of Commerce and of the Jobbers' and Manufacturers' Bureau, I enclose resolutions passed by both organizations. I might add that these were passed at regular meetings and not at ones called for the special purpose of taking action in this matter, and each meeting was attended by more than the usual number of members, thus giving considerable favorable weight to the question."

Resolution Passed at a Regular Meeting of the Jobbers' and Manufacturers' Bureau Held December 19, 1913.

Believing that the five per cent advance in freight rates asked for by the railroads, in Official Classification Territory, is both reasonable and just and is fully warranted in order that they shall be able to maintain the high degree of efficiency expected of them, we hereby express our full approval of their application for said advance.

Resolution Passed at a Regular Meeting of the Huntingdon Chamber of Commerce Held December 11, 1913.

Whereas, Railroads must maintain a high state of efficiency for the safety of both passenger and freight, by adding new appliances and improved equipments; and

Whereas, There is a general advance in the price of all commodities, and an increase in the cost of raw material; and

Whereas, The advanced wage scale demanded and granted to various employes; therefore, be it

Resolved, By the Huntington Chamber of Commerce that the petition of the carriers in Official Classification Territory to advance freight rates five per cent, be granted, and that a copy of this resolution be given the public press, as well as sent to the Secretary of the Interstate Commerce Commission at Washington.

Jobbers' and Manufacturers' Bureau, Huntington.

The following is an official statement made by the Jobbers and Manufacturers Bureau on December 19, 1913, regarding the attitude of their members as to the proposed increase of five per cent in freight rates in Official Classification territory:

Believing that the five per cent advance in freight rates asked for by the railroads, in Official Classification Territory, is both reasonable and just and is fully warranted in order that they shall be able to maintain the high degree of efficiency expected of them, we hereby express our full approval of their application for said advance.

Max Robinson, Acting Secretary, Martinsburg Board of Trade. (Population 10,698.)

The following resolution adopted by the Executive Committee of the Martinsburg Board of Trade reflects the sentiment of the entire membership of this organization. In addition to this "Post A" of the West Virginia Division of the Travelers' Protective Association of America, located at Martinsburg, has adopted similar resolutions, both of which have been forwarded to the Interstate Commerce Commission:

"WHEREAS, Existing conditions demand readjustment of values in all lines of commerce and transportation; Therefore, be it

"*Resolved,* As the sense of this meeting that the railroads are justly entitled to their proportion by some equitable increase in freight rates to enable them to provide adequate facilities and to further safeguard the lives of those they transport and employ."

Max Robinson, President, Travelers' Protective Association of Martinsburg. (Population 10,698.)

The following is a copy of resolutions

adopted by Post A of the West Virginia Division of the Travelers' Protective Association of America at their meeting held January 23, 1914:

Whereas, Present conditions demand increased facilities and better safe-guarding of life on the part of the railroads, and

Whereas, Railroad revenues have been reduced in various ways in recent years and to enable them to provide such additional facilities and equipment, be it

Resolved, By Post A, West Virginia Division of the Travelers' Protective Association of America that the Interstate Commerce Commission be requested to favorably consider a reasonable increase in freight rates for the purpose; be it further

Resolved, That a copy of these resolutions be mailed to that governing body and to the proper officials of those railroads adjacent to this territory.

A true extract from the minutes January 23, 1914.
Post A,
West Virginia Division,
Travelers' Protective Association,
Martinsburg, W. Va.
Max Robinson, D. F. Dennis,
President. Secretary.

Mayor Terence D. Stewart of Morgantown. (Population 9,150.)

(1) I have heard but little discussion by business men with regard to the proposed rate increase, but what I have, has been rather in favor of such increase than against it.

(2) In so far as I have heard the matter discussed, the persons in favor of the increase think it should be granted now.

Secretary, Alex. Purdy, Moundsville Board of Trade. (Population 8,918.)

While our organization has passed no resolutions endorsing the proposed advance in freight rates, my opinion, based on expressions heard from business men and citizens in general, is that there is no objection to an increase in freight rates if they do not exceed five per cent.

Secretary, William Schwertfeger, Business Men's Association of Wheeling. (Population 41,641.)

The following resolution regarding the proposed increase of freight rates in Official Classification territory has been passed by our Business Men's Association:

Whereas, The increasing commerce of our country is constantly demanding more railroad equipment and larger terminals for its rapid movement, and

Whereas, In the present unsatisfactory totals of railroad net earnings they are unable to borrow money for urgent improvements at a moderate rate of interest; and

Whereas, Wages and other expenses of operating are continuously mounting higher; and

Whereas, It is the desire of the business men of this community that American labor receive a maximum wage and that present standards be not lowered now

Therefore, We, the Business Men's Association of Wheeling, West Virginia, most respectfully request the Interstate Commerce Commission to grant the application of the eastern railroads for a five per cent increase in freight rates.

REPLIES INDICATING UNCERTAINTY OR DIVIDED OPINION.

Mayor of Elkins. (Population 5,260.)

(1) I find by making inquiry that our business men are divided on this proposition, but all hope that an amicable adjustment may be reached.

WEST VIRGINIA EDITORIAL COMMENT.

Wheeling (W. Va.) Intelligencer, May, 1913.

The public cannot assume to control and regulate railroad rates without at the same time assuming so to control and regulate them that railroad operations will be profitable to the men engaged in them. We must have railroads. We have a right to expect them to be operated honestly and economically, but we cannot compel them to be operated at a loss to their owners, nor can we so limit them that they will not be able to provide the equipment, keep up the repairs, and to make the improvements necessary to serve the public to the best advantage.

CONNECTICUT.

REPLIES OF A FAVORABLE CHARACTER.

Secretary, F. A. Bennett, Bridgeport Manufacturers' Association. (Population 102,054.)

Our organization has taken no formal action on this matter, but it is understood that in view of the widespread opinions that it is really necessary for the carriers to secure an increased revenue and we are taking no steps to oppose such an increase, leaving the matter in the hands of the Interstate Commerce Commission, believing that if the carriers can show conclusively that it is necessary for them to advance their rates, that their request should be granted.

Secretary, F. S. Valentine, Derby Business Men's Club. (Population 8,991.)

The following resolution, indicative of the attitude of the Derby Business Men's Association, was passed at a meeting held November 3, 1913:

Resolved, That, it is the sense of this Association that in view of the largely increased cost to the New York, New Haven and Hartford Railroad in transporting both merchandise and passengers, the privilege should not be denied them of so advancing their rates as to make receipts equal expenditures, leaving a reasonable margin of profit to the investors in its stock.

Mayor H. B. Marshall of Greenwich. (Population 16,463.)

(1) I do not see how the railroads can get along without the five per cent increase in freight rates as asked for, for the reason that the cost of operation has greatly increased of late years to say nothing of paying interest on such a large quantity of water that many of them are trying to absorb.

Secretary, N. B. McKinney, Greenwich Board of Trade.

While our Board has as yet, taken no action for or against the increase in freight rates, it is my personal opinion that the members would not be opposed to such increases.

Mayor of Hamden. (Population 5,850.)

(1) Yes; if a reasonable amount of the increase is apportioned to improvements and betterments of the service.

(2) Yes; all at once and promptly, if it is necessary to do so in order to keep the service up to the present standard or better it. In view of the high cost of labor and materials, we cannot see or recommend any better way than to allow the railroads to raise their rates to a reasonable extent.

Secretary, John P. Lenning, Middletown Business Men's Association. (Population 20,749.)

The Business Men's Association of Middletown has not taken any special action on the carriers' petition for permission to increase their freight rates. The matter came up at the Board meeting of the State Business Men's Association which I attended as a director from Middletown. The Board endorsed the petition by an unanimous vote. I am confident my vote on that measure accurately reflected the opinion of our business men; at least, no petition has been started for the recall of my vote.

Mayor Geo. E. Barlow, of Shelton. (Population 6,545.)

(1) Yes.

(2) Yes.

From R. C. Blakeson, the Warden, Torrington. (Population 16,840.)

(1) I find after a careful investigation that at a meeting of the Business Men's Association of Torrington with only twenty members present, a vote was passed authorizing their secretary to write to the Interstate Commerce Commission now to allow any advance in freight or passenger rates. After making personal inquiries, and what I have been able to take from our daily papers, I do not think this feeling is representative of the people of this vicinity. I am satisfied that they would approve of a slight advance in rates in order that the railroad companies might use same, first, for the safety of the traveling public and also for increased facilities.

(2) If an increase is granted, this should be done as promptly as possible, so that we would begin at the earliest possible moment to get the advantage of the increased business which it would mean as soon as the railroad companies begin to spend the money necessary to keep their equipment up to the high standard.

REPLIES OF AN UNFAVORABLE CHARACTER.

Mayor of Berlin. (Population 3,728.)

(1) As near as I can find out, the sentiment of the business men of this community is not in favor of any increase.

First Selectman, F. Howard Ensign, East Hartford. (Population 8,138.)

(1) I am sure that the business men of this town do not favor an increase in rates.

REPLIES INDICATING UNCERTAINTY OR DIVIDED OPINION.

Secretary, Wm. I. Barber, Hartford Board of Trade. (Population 98,915.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, Business Men's Association, Hartford.

This Association has had the matter under consideration for some little time, but to date has not taken any definite action for the reason we wish to investigate and ascertain the alleged necessity for a general five per cent increase in freight rates, also the effect such increase would have upon New England industries. While we are not opposed to the principles of a raise in freight rates, we believe that the matter should be carefully considered before any definite action is taken by the Interstate Commerce Commission. One of our committees is to report on this question at a later date.

Secretary, Chas. E. Julin, New Haven Chamber of Commerce. (Population 133,605.)

No action has been taken by this organization for or against the proposed five per cent increase in freight rates in Official Classification territory.

Secretary, F. H. McKenzie, Southington Board of Trade. (Population 6,516.)

No action has been taken by this organization for or against the rate increases.

Secretary, W. C. Kemp, Winsted Business Men's Association. (Population 8,679.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

CONNECTICUT EDITORIAL COMMENT.

Ansonia (Conn.) Evening Sentinel, May, 1913.

It is a foregone conclusion that the railroads cannot forever increase their expenses without increasing their incomes. This rule works out the same with corporations as it does with individuals.

Ansonia (Conn.) Sentinel, November 29, 1913.

Just now there seems to be a general tendency to concede that the demands of the railroads are just and the only hesitancy seems to be over what use will be made by the roads of the additional profits thus acquired.

Bridgeport (Conn.) Standard, November 25, 1913.

While no one relishes the idea of having to pay more for transportation, there is by no means the same opposition to the proposed freight increases in Eastern territory that there was three years ago. The figures presented by President Willard, of the Baltimore & Ohio at the preliminary hearing before the Interstate Commerce Commission yesterday, show that the enforced increases in operating costs combined with an equally compulsory limitation on income make it unprofitable to invest new capital in the additions and improvements necessary to take care of a constantly increasing volume of traffic. As between the slight additional burden of a general five per cent increase in freight rates and the prospect of having to put up with inadequate service, the former is undoubtedly the lesser evil.

Bridgeport (Conn.) Standard, January 17, 1914.

Just how much stimulus an increase in freight rates would give to general business, there is no means of telling accurately, but undoubtedly its beneficial effects would be great.

Farington (Conn.) Register, December 6, 1913.

They need and must have relief, not because of any intrinsic defect, but because of the vastly increased cost of materials and increase of wages. Government-ownership is the only alternative and even the rabid advocates of this would hesitate to advocate it under existing conditions. The roads must be dealt with fairly, the public so requires.

New Britain (Conn.) Herald, November 25, 1913.

It must appear to every intelligent person that in order for every road to meet its obligations that it must have sufficient revenue. There has been a general increase in operating expenses of all financial enterprises, the wages of the employes have been increased, because, as has been explained in a recent report, that the increased cost of living demanded it, and this in itself proves conclusively that with increased expenses should come increased revenue or the railroad business cannot go on under the present method.

New Haven (Conn.) Journal Courier, November 27, 1913.

That there is a great increase in the expenses of the roads is undeniable. It is plainly accounted for by the various increases of wages the roads have been compelled to give their employes, by the increased taxation to which they are subjected, whether justly or unjustly, and by the enormous outlays they have been required to make in obedience to behests of the railroad commissions, state as well as national.

The leading newspapers of the country, almost without exception, concede the necessity of granting the increase the roads ask for, and do not mince matters in advocating the justice of the roads' petition.

New Haven (Ct.) Journal Courier, May, 1913.

The railroads have had hard sledding and their appeal to the Commission is, it must be generally conceded, just and reasonable. That the railroads have been punished enough for their sins of the past is also generally conceded. Any further punishment would, in the view of impartial observers, partake of the nature of persecution.

New Haven (Ct.) Journal Courier, October 18, 1913.

There seems to be no doubt in the minds of all fair minded men who are at all capable of judging the situation, that the petition of the railroads of the country now on record asking for a small increase of freight rates should be granted. The request is a reasonable one. The railroads are struggling under great difficulties in order to pay their way and make necessary improvements which the growth of the country imperatively calls for. Twice, and thrice in some cases in the last few years, the wages of their employes have been advanced. The increases were forced upon the roads both by the men and the unfriendly attitude or tacit consent of the Interstate Commerce Commission, for the employes could strike if their demands were refused while the railroads could not. In other words the railroads had to succumb. The controversy was wholly one-sided. The request of the railroads three years ago when they had granted these men an important increase of wages all along the lines, was denied by the Commission. Since then most of the men have demanded and received another increase of wages. The roads had no alternative and the government would not permit the railroads to strike.

The railroads have a much stronger case to present this time. Everything in the shape of costs and expenses has gone up. Wages are much higher, the cost of materials and equipments is much higher, steel cars are demanded and many other improvements, any of which are ordered by either federal or state commissions, the taxes of the roads have been increased in some cases enormously and finally the interest charge upon money required for improvements is heavily increased. Moreover, despite heavy increases in gross earnings the returns in net earnings is discouragingly small, in comparison. Furthermore, both federal and state authorities seem animated by a spirit of hostility to the roads and disposed to give them as hard sledding as possible.

Apparently also a bias of the Interstate Commerce Commission is disclosed in its hiring a bitter opponent and critic of the railroads to represent the shippers in the pending hearing. The shippers are an able, intelligent and competent body of men, thoroughly able to look out for their own interests and provide their own lawyer in the case. Speaking of this general subject and after referring to the very low rates of passenger fare on the New Haven road, the "New York Times" proceeds to say: "The railroads of the United States are working as hard as the New Haven and are being repaid by scourgings instead of recognition and reward. To use language which ought to be understood, the railways are being pillaged for the benefit of all other interests and by every authority even by those which ought to protect them."

New Haven (Conn.) Journal Courier, November 25, 1913.

That a senseless spirit of hostility to the railroads exists has been plainly manifested for years by State legislatures and not a few of the State Railroad Commissions. There are hopeful evidences, however, that the tide of feeling is turning at last in favor of giving the railroads the small advance of freight rates they ask for. It is becoming apparent to the traveling public that if the railroads are embarrassed and unprosperous, the country can but suffer also. That the railroads are carrying heavily increased burdens owing to "the high cost of living" and the frequent heavy increase of wages that they are obliged to submit to while powerless to raise their rates, is unmistakably evident.

New Haven (Conn.) Journal Courier, November 26, 1913.

Thus far the railroads have appeared to be friendless in the Commission. Its membership has been apparently more disposed to hear and regard the demands of the shippers, who, as a whole, have an axe to grind and some of whom would like to have the roads carry their shipments for nothing and insure them against all loss by accident or delays, in the bargain. The shippers are astute, keen witted and aggressive and well able to guard and protect their own rights and interests. Then there are the stockholders of the railroads. There are hundreds of thousands of them and they have rights also worthy of fair and discriminating consideration. It is somewhat to be wondered at that railroad stockholders, a great number of whom are people of small means, have never formed an organization to demand their rights.

New Haven (Conn.) Journal Courier, November 29, 1913.

The unanimity with which the leading newspapers of the country urge that the Eastern railroads should be permitted an increase of their freight rates, is good enough testimony as to the impressiveness and evident justice of the argument which the fifty-two roads which have petitioned the Interstate Commerce Commission for this increase have just made.

Norwich (Conn.) Record, June 4, 1913.

The railroads are willing to carry extra crews or extra engines or extra brakes or extra anything the legislature think ought to be carried, provided they are permitted to make their rates compensate for the aggravated outlay. That is fair enough. And what they ask is authority to raise their rates precisely five per cent, which is a conservative estimate of the increased return it is imperative they should get. If any plausible argument in opposition has been adduced it has not been generally promulgated. A financial panic among the railroads can only be avoided by granting them "a living wage." A railroad panic would mean a general paralysis of all industry in the nation.

Waterbury (Conn.) American, May, 1913.

It would seem as if the Interstate Commerce Commission must permit the railroads to raise rates. But what a howl will then go up from the shippers everywhere. Another handicap, it will be, speaking locally, for Waterbury, which has to bring all its raw materials, coal, etc., in as well as freight all its manufactured products out. Nevertheless, the concession of higher rates, which will in the end come out of the pockets of the ultimate consumer, is the only obvious solution.

MAINE.

REPLIES OF A FAVORABLE CHARACTER.

Secretary, Maurice C. Rich, Portland Board of Trade. (Population 58,571.)

This Board has not as yet taken any action regarding the increase in freight rates as recently indicated in the petition to the Interstate Commerce Commission. The sentiment of our people generally seems to be to meet the railroads half way in any movement tending towards increasing their income sufficient to defray their necessary expenditures. This, of course, is not an official statement, but is merely given as I have heard it by men in casual conversation.

Secretary, B. F. Colcord, Searsport Board of Trade.

The Board of Trade has not passed any resolutions relative to this matter, but I have talked with the President and a majority of the members and they all express the same sentiment: that there is nothing else to do if we want to keep the railroads out of the receiver's hands.

REPLIES OF AN UNFAVORABLE CHARACTER.

Secy., Frank A. Clark, Spring Valley Board of Trade.

Our organization is opposed to the increase in freight rates as noted in your letter.

REPLIES INDICATING UNCERTAINTY OR DIVIDED OPINION.

Secretary, Augusta Board of Trade. (Population 13,211.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, Arthur K. Pennington, Bath Board of Trade. (Population 9,396.)

From the general discussion I have heard among business men, I should say that opinions were about evenly divided.

Secretary, Embert L. Jones, Gorham Board of Trade. (Population 2,822.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, Houlton Chamber of Commerce. (Population 5,845.)

No action for or against the increase has been taken by the Chamber of Commerce.

Secretary, W. H. K. Abbott, Waterville Chamber of Commerce. (Population 11,458.)

No action for or against the increase has been taken by the Chamber of Commerce.

MAINE EDITORIAL COMMENT.

Lewiston (Me.) Sun, May, 1913.

There is need of hundred of millions more of capital in railroad mileage and terminals and equipment. The grip of the Interstate Commerce Commission on the rate end, and the grip of the unions on the wage end are so suffocating that the march of growing industry is sure to be delayed.

Waterville (Me.) Sentinel, May, 1913.

We believe that the public will not object to such increased charges as are really necessary to provide for reasonable increases in wages.

RHODE ISLAND.

REPLIES OF A FAVORABLE CHARACTER.

President, Frank Baull, Bristol Town Council. (Population 8,565.)

(1) My belief is that the sentiment is universally in favor of the five per cent increase * * * * a favorable report on the freight rate increase will assist in my opinion * * * * this part of the country.

(2) I believe that the flat proposition of a general five per cent increase in freight rates is what public sentiment favors. Individual rate readjustments and National regulation of railway securities are two such intricate and complex questions that the general public is unable to discuss them intelligently. Such questions should be, and no doubt will be, scientifically disposed of by men of capacity and training. * * * * Let the Interstate Commerce Commission grant at once a five per cent freight increase and impose upon the railroad companies a note of confidence.

Pres., Alex. Leslie, Lincoln Town Council. (Population 9,825.)

(1) To the best of my knowledge and belief, there is no question about the sentiment of the business men of this community being strongly in favor of the five per cent increase in freight rates. Personally, I am strongly in favor of it for the reason that we cannot be prosperous unless we have railroad facilities of the very best and this we cannot expect unless the railroads have fair consideration which is demanded on account of the increased wages, improved equipment, increases in taxation, etc.

(2) There is no possible doubt about the sentiment of this community being in favor of the increase being granted as promptly as possible. It is believed that the improvement of railroads will materially help business conditions and our judgment is that the increase should be granted at once. No business can continue where heavier liabilities are forced upon it, unless a just allowance be made to increase its assets.

REPLIES INDICATING UNCERTAINTY OR DIVIDED OPINION.

Secretary, A. B. Commesford, Newport Board of Trade. (Population 27,149.)

No action has been taken by this Board of Trade for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, S. H. Davis, Westerly Board of Trade. (Population 8,696.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, W. R. Williams, Woonsocket Business Men's Association (Population 38,125.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

RHODE ISLAND EDITORIAL COMMENT.

Newport (R. I.) News, November 28, 1913.

Now the railroads wish their wages increased, and if they should threaten to strike the public would not stand it a minute. If the companies should cease operating their lines there would be an instant demand from the great majority of the people that their charters be forfeited and the general Government or the States take over the lines, or the roads be offered for sale or lease to any company which would run them.

When the men desire more wages there is no way of refusing them except to stop the commerce of the country, but when the companies wish more wages they cannot resort to force. They must secure the permission of a branch of the Government, which, being inherently political, cannot be entirely unmindful of the number of votes cast by railroad employes and by wage earners in general. * * *

Operating expenses are increasing, and the railroads are not unreasonable in insisting that they must have larger revenues.

Providence (R. I.) Evening Bulletin, May, 1913.

It is an inescapable fact that a railroad, to sell its stocks and bonds, must not merely pay fair dividends, but must show a surplus of earnings at each year's close to put back into the property. What else can the railroads do except to apply for approval of higher rates? If the Interstate Commerce Commission should actually refuse to permit traffic rates to be raised the railroads would face a crisis. Kept by the Government from increasing their incomes and prevented by the Government (Erdman Arbitration Act) from restricting their expenses, they might just as well sell out to the Government and have done with it.

Providence (R. I.) Bulletin, November 29, 1913.

Why should the wholesale or retail merchant be permitted to mark up his goods, and the railroads be perpetually enjoined from doing likewise? The answer used to be found in the statement that a railroad is a natural monopoly, but that argument has lost most of its weight, for if it is a natural monopoly it is a highly regulated one. Its fangs have been drawn; instead of being a dangerous monster, as it used to be pictured, it is a needy creature pleading for fair play and a chance to make a reasonable living. The freight rate increase now asked for should be granted without delay. The roads need it immediately. It is a condition, not a theory, that confronts them.

The prosperity of all of us is wrapped up with that of our transportation systems. What affects them, advantageously or adversely, affects the rest of the community. The five per cent increase will not burden the consumer to any marked degree, while to withhold it would be to invite a serious public disaster.

Providence (R. I. Journal, November 27, 1913.

The public is largely responsible through its lawmakers, for the conditions that exist. Legislatures have compelled the companies to employ men who were not needed; the "full crew laws" passed at the behest of the labor unions, add millions to the expenses and give the public absolutely nothing in the way of safety or efficiency —they merely force the companies to pay high rates of wages to men who loaf in the caboose. Tax assessors everywhere are piling up taxes on railroad property. Arbitration Boards working under Federal laws are granting most liberal increases in wages. Every dealer in commodities used by the railroads has added from ten to fifty per cent to his prices. The result—decreasing net earnings and increasing gross receipts—is bad for the railroads and for the people served by them. The country is growing, but the development of the railroads is halted.

The remedy lies in a readjustment of freight rates to correspond with conditions forced upon the carriers. The railroads have a just claim for a new schedule which will restore their credit and induce investors to put their money into transportation enterprises. Rates in the United States are approximately one-half lower than on Government-owned lines in Europe; the five per cent advance proposed is too small to be a factor in retail prices, although the total additional revenue provided will help the roads materially in meeting their obligations to the public in the providing of better facilities.

Government ownership is not necessary; the companies generally are progressive and their management is good, and it would be a mistake to turn the railroads over to politicians who naturally would be under the influence of aggressive labor unions. But there is danger that this undesirable state of affairs will be brought about. Obviously if the Government persists in a policy of increasing expenses and cutting down revenue there will be a disaster, and the Government may be obliged to assume responsibilities for which it is unfitted and to carry a debt of billions of dollars, without the slightest compensating advantage.

The common sense course is to let the railroads earn enough to pay their bills and leave a reasonable profit for their owners. This is the rule in every other line of business and the necessities of the roads are so pressing that it will be strange if the Interstate Commerce Commission fails to hand down an equitable decision on the application.

Providence (R. I.) News Democrat, November 26, 1913.

That the railroads will get a chance to raise their freight rates, where they have asked for that privilege, seems very probable. There can be no question among fair-minded men that they are entitled to have more money for hauling freight than they are now getting, on the showing made by them before the Interstate Commerce Commission. Some have doubted the wisdom of many of the plans adopted for regulating the railroads, but for weal or woe public sentiment supports what has been done, and there is little reason to believe that there will be, for some time, any greater freedom given the railroads than they now have. But as they are forced to deal with the public along certain lines, and must pay greater wages to employes than formerly, and the cost of the things the roads buy is so much greater than formerly, simple justice would seem to require that where they show the necessity of higher rates to make a reasonable profit, they should be allowed to increase their rates.

Providence (R. I.) Tribune, December 7, 1913.

Immediate relief for the business situation still depends on the action of the Interstate Commerce Commission on the request of the railroads for increased rates. * * *

That some increase will be allowed is, it is said, being almost taken for granted. But the long drawn out proceedings of the Commission will not, at the earliest, come to a conclusion until some time in April, which leaves a long winter of discontent, with the possibility of constant additions to the army of unemployed. It is already pointed out that one railroad is planning to let out ten thousand men.

Perhaps this is the only remedy, though a hard one, for the unwisdom of politics. Politicians have been piling up restrictive laws and forcing from corporations much more than is just and even more than is safe. When they begin to hear from the great body of laborers who cast the votes more heed will be paid than heretofore.

Providence (R. I.) Journal, December 17, 1913.

Railroad construction has been checked throughout the country. Some roads have abandoned plans for extensions, finding it difficult to operate and maintain the tracks already laid. The public is being put to inconvenience by the lack of facilities which the companies acknowledge are urgently needed. Yet the money for improvements is not to be had because of the constantly narrowing margin between receipts and expenditures. The reports to the Interstate Commerce Commission show the situation clearly; gross earnings are the largest in the history of the railroads and net earnings are approaching the vanishing point. The obvious remedy for this most undesirable state of affairs is in rates corresponding to the increases in wages obtained through commissions appointed under Government authority and to the rising cost of everything used in maintenance and operation. The correction of these inequalities should not be postponed for an indefinite period, and the pending application should be decided upon its merits regardless of action by Congress on the proposition for conferring additional powers on the Interstate Commerce Commission.

Providence (R. I.) Journal, January 9, 1914.

Why should time be wasted in reviewing ancient history? The Commission does not ask for this kind of information when ordering rates reduced, and there is no lack of statistics which prove that a five per cent advance is reasonable and just.

NEW HAMPSHIRE.

REPLIES OF A FAVORABLE CHARACTER.

Secretary, J. H. Wight, Berlin Board of Trade. (Population 11,780.)

Personally, I am in favor of a reasonable increase in rates, although our Board of Trade has passed no resolutions relating thereto.

Secretary, James O. Lyford, Concord Board of Trade. (Population 21,497.)

No resolutions have been adopted by the Concord Board of Trade on the subject of increased freight rates. Nor has there been any manifest disposition in this community to protest against the increase. The attitude of our business men so far as I am able to learn, is that the railroads should have sufficient compensation to enable them to meet the demands of the public. The proper equipment of the railroads so that they can adequately discharge their duties as common carriers and promptly deliver freight is of more vital concern to our business than the question of an increase in charges for transportation. It is evident from the recent report of the Public Service Commission of this State that the railroads of this section have not sufficient revenue to give adequate facilities for the business they have to do after meeting the charges that now rest upon them.

Mayor W. W. Edwards of Franklin. (Population 6,132.)

(1) It appears to be the general sentiment of the business men and the people at large of this city that the rates should be raised.

(2) The sooner the increase is granted, the sooner will the railroads be enabled to serve the public on a safer and saner business basis.

Mayor H. E. Fay of Keene. (Population 10,068.)

(1) So far as I know, private opinion freely expressed, is very largely in favor of the increase.

(2) Yes; the sooner the better.

Secretary, William Littler, Keene Commercial Club.

While no official action has been taken by the Commercial Club of this city regarding the proposed advance in freight rates, the general sentiment is that a certain advance in rates is eminently justifiable on account of the growing expenditures and lessening net revenues of the railroads. On the other hand, there is a feeling that a flat percentage of increase would be preferable to the varying schedule of advances which would come into effect as a result of a classification by zones, as it is believed that under the latter system, the local shipper would frequently get the worst of it on the short haul, though directly in competition with points outside the state where the long haul traffic would not bear the same percentage of increase.

Mayor of Lebanon. (Population 5,718.)

(1) Yes.

(2) Yes.

Secretary, Wm. Savacool, Manchester Chamber of Commerce. (Population 70,063.)

There is a difference of opinion among our members as to just what should be done, but it would seem as though it would be necessary to make a reasonable increase in rates to put our New England rates on a self-sustaining basis again, and pay a reasonable return on the capital invested.

Secretary, A. B. Rotch, Milford Board of Trade. (Population 3,939.)

Our organization has taken no definite action expressing an opinion regarding increased rates, although recently a strong feeling has been created that an increase is needed. Probably most of our members are personally indifferent to rates.

Mayor H. B. Yeaton of Portsmouth. (Population 11,269.)

(1) Personally, I am in favor of the roads being allowed to make the advance.

(2) Yes, immediately.

Mayor F. B. Preston of Rochester. (Population 8,868.)

(1) I believe the business men of this vicinity are in favor of an increase in freight rates so that the carriers will be able to conduct their affairs with profit to themselves and to the public.

(2) I also believe that the public desires the increase to be made without delay and the details to be settled at a later time.

Secretary, Thos. A. Baril, Rochester Board of Trade.

As secretary of the Rochester Board of Trade, I would state that I know the sentiment is in favor of allowing the railroads to make a living.

REPLIES INDICATING UNCERTAINTY OR DIVIDED OPINION.

Mayor, Daniel J. Daley, Berlin. (Population 11,780.)

(1) The chaotic condition of this general subject for some time past makes an intelligent answer to this question extremely difficult.

Mayor, Charles H. Foss, Dover. (Population 13,247.)

(1) As neither the Board of Trade nor any other organization here has passed any resolutions in relation to this subject, and as the local newspapers have published nothing which might be recorded as an expression of opinion of the public, I am unable to reply to your inquiry.

VERMONT.

REPLIES OF A FAVORABLE CHARACTER.

Mayor James E. Burke of Burlington. (Population 20,486.)

(1) My personal opinion is that present conditions demand an increase in railway revenue owing to the increased expense of maintenance which I believe to be of permanent nature.

Secretary, F. B. Houston, Burlington Commercial Club.

No action has been taken by our organization for or against the proposed increase in freight rates, but President J. L. Southwick, of the Commercial Club, expresses himself in favor of the proposed increase, provided better service be given by the carriers to the public instead of diverting it into other channels.

Burlington (Vt.) Free Press, December 16, 1913.

We have held that in railroading as well as in all other departments of business activity we can not reasonably expect improved service without increased expenditure. Somebody must pay for new railroad stations and improved means of promoting safety of travel and all that.

Montpelier (Vt.) Journal, May, 1913.

The vigilance of the Commission can be trusted to prevent the railroads from taking advantage of their present necessities to milk the public later on.

A. C. Mason, Secretary, Rutland Business Men's Association. (Population 13,566.)

We would advise that at a meeting of the Executive Committtee of this Association, held on the evening of January 28, 1914, the following resolution was adopted:

"*Resolved,* That the Rutland Business Men's Association unanimouslv favor the five per cent rate increase in the manner indicated in the railroads' recent petition to the Interstate Commerce Commission."

VERMONT EDITORIAL COMMENT.

Rutland (Vt.) Herald, November 26, 1913.

Much depends upon the decision of the Commission. The cost of railway operation has increased so rapidly that the roads cannot continue to give what the public demands in the way of transportation facilities unless they are permitted to earn more money. There is no doubt that the public would welcome a decision granting living rates to the carrying companies.

Rutland (Vt.) Herald, December 10, 1913.

No well-informed person in this country wants Government ownership of railroads, but it is as clear as anything can be that the roads cannot continue to meet demands for more and better transportation facilities unless they can get the money required to carry on their work. Mr. Brown is not alone in believing that the granting of the request for increased freight rates is a matter of vital importance to all the people of this country. There is reason to believe that favorable action by the Interstate Commerce Commission would be followed by an immediate revival of business.

Rutland (Vt.) News, November 29, 1913.

While shippers are not anxious for an increase in freight rates, there is evidence that the public is ready for a square deal for the railroads, the baiting of which has been more or less popular for the last few years. Legitimate prosperity for the railroads is as important to the public as to the roads themselves, and this they should have a chance to achieve. They are entitled to fair play.

St. Albans (Vt.) Messenger, May, 1913.

Whether railroads can live with increased taxes and increased wages, resulting in increased operating expenses, but with no increase in operating income for the unit of service rendered, is what the general public must determine. The investing public may arrive at a conclusion before the general public does, and, if so, great harm will be done.

REPLIES INDICATING UNCERTAINTY OR DIVIDED OPINION.

Secretary, Homer A. Flint, Montpelier Board of Trade. (Population 7,856.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

Secretary, James B. Campbell, St. Johnsbury Commercial Club. (Population 8,098.)

No action has been taken by this organization for or against the rate increase.

DISTRICT OF COLUMBIA.

REPLIES OF A FAVORABLE CHARACTER.

Secretary, Thomas Grant, Chamber of Commerce. (Population 331,069.)

While no formal resolution has been passed by this organization, one of our leading business men at the October meeting, in discussing the railroad proposition in which we are interested, during the course of his remarks stated plainly that the railroads were entitled to the increase in rates and that he, for one, would be very glad to pay his share. The gentleman in question is one of our largest shippers. His remarks were greeted with applause and no dissenting opinion was voiced.

REPLIES INDICATING UNCERTAINTY OR DIVIDED OPINION.

Secretary, C. G. Gockeler, Washington Board of Trade. (Population 331,069.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

WASHINGTON EDITORIAL COMMENT.

Washington (D. C.) Evening Star, November 26, 1913.

There is no denying the force of the railroads' contention that they have been for some years under stress of a continuous process of expense increase without corresponding rate increase. It may be that the Interstate Commerce Commission, after a thorough investigation of the matter, will hold that the balance has been struck and that the ratio of rates and expenses is now correct, or it may hold that the pendulum was swung too far against the right of the railroads to earn reasonable dividends and authorize somewhat of an increase to restore the equilibrium. The principle involved is that of striking the true medium, with consideration both for the railroad stockholders, whose millions are invested in these properties, and the railroad users, whose millions are spent in transportation rates.

It is quite as undesirable to force the railroads too far under a burden of increasing expenses as to permit them to go too far in the direction of high rates and exececssive profits. The essence of federal regulation of rates is to maintain the right relationship between costs, rates and profits, and the present application sets in motion the process of readjustment that is quite as desirable from the point of view of the railroad user as from that of the railroad owner. For it is to the interest of the public that the railroads should prosper sufficiently to improve their lines and extend them so as to grant increasingly valuable service. Railroad stagnation, from whatever cause, is harmful to the people, and an enlightened public sentiment should always favor the extension to the transportation lines of a fair scale of earnings, which cannot be assured, save by the adoption of a fair scale of rates.

Washington (D. C.) Herald, May, 1913.

Coming down to hard facts, the interests of the railroads and the public are really identical, because one cannot suffer losses without the other being affected thereby. No man, no corporation, can spend a dollar when less than that dollar is earned.

Washington (D. C.) Herald, December 8, 1913.

The mileage of our railroads is so enormous, the number of their employes is so great, they are such huge purchasers of basic products, like iron, steel, timber, etc., that naturally if they are at a low ebb, a prodigious number of other industries suffer the same adversity. Therefore, for the general prosperity of the country, it is undoubtedly advantageous for the railroads to receive permission to raise rates and to re-enforce their dwindling net revenues.

Washington (D. C.) Herald, December 8, 1913.

Many foreign railway experts come to America every year to study the efficiency methods of railroads here, and if American railway freight charges be compared with those prevalent in Great Britain and on the Continent, it will be quickly seen how well off our shippers in this country really are. This does not mean that American railways have reached the highest point of efficiency possible. But it does mean that on the whole they are well and economically handled and deserve the strong support of the community.

The Interstate Commerce Commission is also well aware that, as the prosperity of the railways rises and falls, so generally industry in this country rises and falls. The mileage of our railroads is so enormous, the number of their employes is so great, they are such huge purchasers of basic products, like iron, steel, timber, etc., that naturally if they are at a low ebb, a prodigious number of other industries suffer the same adversity. Therefore, for the general prosperity of the country, it is undoubtedly advantageous for the railroads to receive permission to raise rates and to reinforce their dwindling net revenues.

Washington (D. C.) Herald, December 10, 1913.

The railroads need $1,000,000,000 of new money next year. If the Interstate Commerce Commission gives them an increase in rates, thereby making their dividends fairly safe, and making their margin of earnings for bond interest secure, there can be no reasonable doubt that the railroads will be able to secure their requisite funds. If this clearly may be foreseen, apprehension on the part of business men in general will disappear. They will pluck up heart and go on with normal and increasing business.

On the contrary, if the Commission declines this increase and the transportation companies find themselves badly up against it, the railroad receiverships that may result will mean a far greater letting up in business than is evident to-day, and will mean a dismal return to the empty dinner pails that began to resound hollow and sad just twenty years ago last spring.

Washington (D. C.) Post, December 29, 1913.

Can the government afford to play fast and loose with the railroads in the matter of an advance of five per cent in freight rates?

The Interstate Commerce Commission a while ago called upon the railroads for a mass of information, statistical and otherwise, which, it was stated, was to be used as a basis for determining the justice of the request for an increase in earning capacity. There is no complaint of failure to comply with the Commission's orders. The desired data were submitted, hearings held for presentation of testimony and argument by both shippers and carriers, the inquiry closed, and the case taken under consideration for final decision. There is no public protest in any quarter against giving the railroads the square deal as between the public service they perform and the public that is served.

Suddenly and inexplicably the case is reopened by the Commission. It is given out, apologetically, that while the railroads have submitted elaborate and helpful information showing losses in net operating returns and net income, "fundamental questions" have arisen in the proceeding which, the Commission now feels, call for a world of additional necessary data in order to determine "the general course carriers may pursue to meet the situation," whatever that vague and unsatisfying use of terms may mean.

Washington (D. C.) Star, November 26, 1913.

It would be unprofitable to enter upon an analysis of the technical facts presented by the railroads in their statement of the case in favor of an increase of rates. The Interstate Commerce Commission is so amply qualified to weigh and measure the facts and figures with respect to freightage incidents and operation cases of the several lines and groups of lines that the interest of the public can well be confined to the case of the railroads as a whole. This is readily understandable and when grasped in its true bearings leaves little reason for the Interstate Commerce Commission to hesitate about granting the small advance in rates asked at this time.

DELAWARE.

REPLIES INDICATING UNCERTAINTY OR DIVIDED OPINION.

Secretary, Wilmington Chamber of Commerce. (Population 87,411.)

No action has been taken by this organization for or against the proposed increase of five per cent in freight rates in Official Classification territory.

DELAWARE EDITORIAL COMMENT.

Wilmington (Del.) Every Evening, May, 1913.

The rates for freight hauling on the railroads of the United States are said to be the lowest in all the world, and now it is apparent that they are too low. Therefore, it becomes an interesting question what the railroads will do if the Interstate Commerce Commission refuses to allow them to make the proposed five per cent advance in freight rates. The impairment of railroad facilities would seriously impair the conduct of general business throughout the country.

Wilmington (Del.) Every Evening, November 26, 1913.

Who would have imagined, a few years ago, that the railroads of the country would be required to make application for a subordinate branch of our general government for permission to perform an act so manifestly within their own rightful province as an increase in rates to an extent requisite to the increased revenues that they stand in pressing need of? But such is the situation to-day, and it is a very serious one for the railroads and the people.

The decrease in net earnings the roads attribute to unusual additions to their expenses, specified as follows:

Increased wages as a result of arbitration and mediation, which have added many millions to the salary payments.

Increase in the number of men employed in compliance with "full crew" and similar laws.

Passage of workmen's compensation and like legislation.

Particularly heavy additions to the tax payments.

Higher prices for materials and equipments, proportionate to the general "high cost of living."

These factors that make for greater cost of operation the roads regard as virtually permanent, and with such a condition staring them in the face they say they must find some way to offset it.

This is a convincing presentation, made by men of experience, who speak with a knowledge of the affairs of the railroads generally, and especially of those under their immediate supervision. Although it is a presentation of one side only, it is hard to conceive how this situation can be controverted by those who have only belief and theories to offer in contravention.

Wilmington (Del.) Journal, December 12, 1913.

It must be clear to the public that with such conditions existing something must be done for the relief of the railroads if they are to continue to give to the people the present efficient service. No one wishes to have increased freight rates, but if the expenses of the railroads have increased and their earning power has decreased, then, certainly, the public interest demands that there shall be a readjustment that will place them upon a safe and fair financial footing. Our country would suffer untold injury were it compelled to rely upon bankrupt, or near-bankrupt, railroad companies for its freight and passenger transportation facilities.

Wilmington (Del.) Journal, December 12, 1913.

It must be clear to the public that with such conditions existing something must be done for the relief of the railroads if they are to con-

tinue to give to the people the present efficient service. No one wishes to have increased freight rates, but if the expenses of the railroads have increased and their earning power has decreased, then, certainly, the public interest demands that there shall be a readjustment that will place upon them a safe and fair financial footing. Our country would suffer untold injury were it compelled to rely upon bankrupt, or near-bankrupt, railroad companies for its freight and passenger transportation facilities.

Wilmington (Del.) Every Evening, December 23, 1913.

President Wilson has announced that the one policy of his administration will be generous co-operation with business interests for procedure under the law, instead of antagonism and continual collision.

This intimation of a cessation of the unjust and debilitating war that has long been waged against corporate business no doubt includes the railroads. They have been harassed by continually increasing expenses of operation, especially in higher wages and higher prices for material. Now they are asking permission to make a slight increase in freight charges, for the purpose of advancing revenues to the required point. Thus far the attitude of the Interstate Commerce Commission has been hostile to the request of the railroad managers, but may not the attitude of that body change in pursuance of the policy of the administration as announced by President Wilson? It is hoped so.

Wilmington (Del.) Journal, December 23, 1913.

In considering the application of the Eastern railroads to make a five per cent increase in freight rates, the Interstate Commerce Commission cannot fail to take into account the way in which railroad wages have been increasing. Statistics filed by the Commission show that the various railroads in the territory affected by the application paid out $506,000,000 in wages and salaries in the year ending June 30, 1913. Estimates for twenty-nine of the thirty-eight railroad systems concerned show an increase in wages for 1913 of $48,618,972.41 due to changes in rates of pay and working conditions.

Those are figures that cannot be ignored by those who are passing upon the sufficiency of existing rates when the largely increased expenses of the transportation lines are taken into consideration.

RECEIVED TOO LATE FOR CLASSIFICATION.

Alford A. Wood, Secretary, Butler Business Men's Association. (Population 20,728.)

I am instructed to inform you that our organization favors the increase in freight rates as indicated in the recent petition to the Interstate Commerce Commission. The matter has been thoroughly discussed by representatives of the large business enterprises in Butler and has been unanimously endorsed.

Theodore Heysham, Secretary, Norristown Chamber of Commerce. (Population 27,875.)

At the regular monthly meeting of the Norristown Chamber of Commerce held on February 10th, that body unanimously endorsed the petition of the railroads to be permitted to increase their freight rates in the manner indicated in their recent petition to the Interstate Commerce Commission.

MICHIGAN.

Mayor of Niles. (Population 5,156.)

(1) I find it the sentiment of the business men of this city that carriers should be granted an increase of five per cent in their freight rates.

(2) Yes.

WISCONSIN.

T. E. Mead, Secretary, Baraboo Commercial Association. (Population 6,324.)

As to the opinion of the members of our Club regarding the proposed increase in freight rates, if a small increase is necessary we do not feel that it would work any hardship on any one if it were granted.

I. A. Herrick, Secretary-Manager, Antigo Commercial Club. (Population 7,196.)

Our organization is in hearty sympathy with any advance in rates that the business of our great transportation lines demand. Accordingly, therefore, the enclosed resolutions are forwarded to you for such use as you may desire to make of them:

Whereas, The increased cost of natural production in raw materials and the added labor expense adds materially to the basic cost of public carriers for freight and

Whereas, Sound business requires all enterprises to be conducted on a paying basis, and

Whereas, The increased demands for freight facilities in running wear and improved road beds require a great outlay on the part of such common carriers,

Resolved, That it is the unanimous sentiment of the management of the Commercial Club of Antigo, that reasonable advances in accordance with approved schedules prepared by the Interstate Commerce Commission are approved, wherever such advance in freight charges produce quicker, safer and better service.

COMMERCIAL CLUB OF ANTIGO,
Frank J. Finncane, President,
Fred L. Berner, Secretary,
I. A. Herrick, Secretary-Manager.

SYNOPSIS OF THE

Fifty-Ninth Annual Report of the Northern Central Railway Company

GENERAL OFFICE.

BALTIMORE, MD., 18th February, 1914.

The Board of Directors herewith submit to the Stockholders of The Northern Central Railway Company a synopsis of their Annual Report for the year 1913:—

Rail operations—revenues		$13,563,721.66
Rail operations—expenses		11,996,728.12
Net revenue—rail operations		$1,566,993.54
Auxiliary operations:		
Total revenues	$14,900.50	
Total expenses	8,343.04	
Net revenue		6,557.46
Net railway operating revenue		$1,573,551.00
Railway tax accruals		514,193.62
Railway operating income		$1,059,357.38
Other income:		
Rent income	$414,193.80	
Income from dividends and interest on investments	1,198,639.92	
Miscellaneous income	264,744.31	
		$1,877,578.03
Gross income		$2,936,935.41
Deductions from gross income:		
Deductions for lease of other roads	$283,961.11	
Interest deductions for funded and unfunded debt	377,354.01	
Hire of equipment, rent deductions, and miscellaneous deductions	572,548.42	
		1,233,863.54
Net income		$1,703,071.87
Appropriations to sinking and other reserve funds	$80,275.75	
Dividend appropriations aggregating 8 per cent.	1,547,400.00	
Appropriations for Additions and Betterments:		
Expended during the year	75,396.12	
		$1,703,071.87
Amount to credit of Profit and Loss, 31st December, 1912	$9,609,051.29	
Sundry credits during the year	418,282.47	
		$10,027,333.76
Sundry debits during the year		92,420.10
Balance to credit of Profit and Loss, 31st December, 1913		$9,934,913.66

GENERAL BALANCE SHEET—(Condensed).

31ST DECEMBER, 1913.

ASSETS.

Property Investment:		
Road and Equipment		$34,625,182.26
Securities owned		7,108,726.23
Other Investments:		
Miscellaneous investments		2,401.00
Working Assets:		
Cash	$437,167.22	
Securities issued or assumed—held in treasury	12,000.00	
Balances due from other companies	145,054.10	
Net balances due from agents and conductors	341,970.82	
Miscellaneous accounts receivable	389,229.50	
Materials and supplies	717,121.33	
		$2,042,542.97
Accrued income not due		98,287.70
Deferred Debit Items:		
Temporary advances to proprietary, affiliated and controlled companies	$895,475.04	
Working funds	1,980.00	
Cash and securities in sinking and redemption funds	617,000.00	
Cash and securities in insurance funds, etc.	1,608,162.39	
Other deferred debit items	22,052.18	
		3,144,669.61
Total		$47,021,809.77

LIABILITIES.

Capital stock		$19,342,550.00
Mortgage, bonded and secured debt		7,296,262.07
Working Liabilities:		
Loans and bills payable	$785,000.00	
Balances due to other companies	915,951.96	
Audited vouchers and wages unpaid	643,861.73	
Miscellaneous accounts payable	1,251,848.37	
Matured interest, dividends and rents unpaid	777,727.50	
Other working liabilities	6,396.81	
		4,380,786.37
Accrued liabilities not due:		
Unmatured interest, dividends and rents payable	$162,971.33	
Taxes accrued	216,452.42	
		379,423.75
Deferred credit items		210,932.20
Appropriated Surplus:		
Additions to property since 30th June, 1907, through income	$3,226,909.21	
Reserves from income or surplus:		
Invested in sinking and redemption funds	617,947.38	
Invested in other reserve funds	$1,404,452.06	
Car Trust principal charged out in advance	227,633.07	
		5,476,941.72
Profit and Loss		9,934,913.66
Total		$47,021,809.77

TRAFFIC.

The number of tons of freight carried was 24,264,748, an increase of 1,392,555 or 6.09 per cent. The number of passengers carried was 5,405,363, an increase of 296,185, or 5.80 per cent.

GENERAL REMARKS.

The income statement shows that the total rail revenues for the year 1913 were $13,563,721.66, an increase of $719,005.59 over the previous year. This increase is chiefly in the freight and passenger revenue.

Of the increase, $21,290. 43 was derived from merchandise freight traffic; $384,741.81 in coal and coke traffic; and $250,608.04 in passenger revenue due very largely to travel on account of the inauguration of the President and the fiftieth anniversary of the Battle of Gettysburg.

The rail operating expeness were $11,996,728.12, an increase of $1,052,721.56 over 1912, of which $158,299.89 is in maintenance of way and structures due to higher wages and heavier outlays for bridges, buildings and track material; maintenance of equipment increased $503,137.13, due to higher wages, greater use, and consequently increased repairs to locomotives and freight cars and higher charges to properly provide for equipment depreciation; while transportation expenses increased $352,308.21, due generally to increase in wages, greater yard and freight station expenses due to increased traffic and higher charges for fuel.

In connection with the question of wages and the arbitration thereof with your employes under governmental legislation, it will be recalled that within the past two years adjustments of such controversies have been reached in the cases of the enginemen, firemen, conductors and trainmen. While in principle the advantage of settling wage disputes by arbitration is conceded, in practice it has so far resulted not only in increasing the wages of the employes, in whose behalf arbitration was directly invoked but has largely augmented the wages by specific restrictions in operation, so that it is difficult to secure compensatory service for the wages awarded, and has also generally necessitated various adjustments in the wages of other employes. As the control of railroad rates is by law vested in another governmental body, the railroad companies have not as yet been able to obtain advances therein that would enable them to meet the increased burdens that have been thus placed upon them. In other words, while for the purpose of avoiding interruption and delay to traffic, the railways have yielded to the demands of the public that wage questions shall be submitted to arbitration, and have also met other heavy expenses resulting from legislation, both State and Federal, and thus in some cases have had their expenses increased beyond their ability to meet them and leave a margin as a basis for credit or for any return to their stockholders, they have had no protection through the authorization of the reasonable advance in rates for which they have applied to the Interstate Commerce Commission. At present, therefore, your management is compelled to use every measure to conserve its resources and seriously restrict its capital expenditures.

Railway taxes continue to show an increase, being $49,691.79 greater than in 1912, caused by an increase in the federal taxes.

Other income shows an increase of $389,401.69 over the previous year, of which $36,433.00 was received for the use by other companies of facilities at Baltimore; an increase of $166,262.50 in dividend income, $122,500 of which was from holdings of Union Railroad Company stock and increased dividends resulting from the exchange of Baltimore and Ohio Railroad stock for that of the Southern Pacific Company, to which reference is hereinafter made; there was an increase of $134,601.59 in miscellaneous income principally on account of the larger sum paid by the Pennsylvania Railroad Company as its proportion of the deficit in operating the Elmira and Williamsport and Elmira and Lake Ontario Railroads forming the Elmira Division.

The deductions from gross income increased $128,676.87, the principal increase being in the item "Hire of Equipment," which is $80,518.28 higher than in 1912, because of increased use of freight cars of other companies and the higher per diem rate in effect.

The net income for the year was $1,703,071.87, a decrease of $122,361.84 compared with 1912. After deducting the regular semi-annual dividends aggregating eight per cent, and the appropriation to sinking and other reserve funds amounting to $80,275.75, there remained a balance of $75,396.12, which was used on account of additions and betterments.

The efforts made to economically handle your freight and passenger traffic is evidenced by an increase of only 0.12 per cent in the freight train mileage, notwithstanding the tonnage increased 6.09 per cent and the ton miles 5.75 per cent. The average freight train load was increased 29.23 tons. The passenger train mileage increased only 3.61 per cent despite an increase of 5.80 per cent in the number of passengers carried and an increase of 12.91 per cent in the passenger mileage. However, as explained elsewhere, the continuing increase in expenses, caused principally by increases in wages, taxes and legislative enactments, has decreased the net freight revenue per ton mile to six-tenths of a mill and the net revenue per passenger mile to sixteen one-hundredths of a mill.

The necessity for the enlargement of freight terminals in the City of Baltimore makes it evident that this work can not be much longer deferred without causing very serious congestion and a considerable increase in the expense of handling traffic, especially in the Calvert District, where the volume of traffic is beyond the capacity of the present tracks and station. Therefore, freight yards at Monument and Constitution streets, and at Aliceanna street and Central avenue were improved; and the real estate has been acquired and final plans are being formulated for pier extensions at Canton. The necessary real estate required for the enlargement of the Calvert Street Terminals was also purchased and the company has entered into negotiations with the City of Baltimore for the necessary revision of streets to materially enlarge the yard and station at that point.

Little progress has been made during the past year towards a termination of the litigation instituted by a few of the stockholders which prevents the consummation of the proposed lease of the property and franchises of your company to the Pennsylvania Railroad Company.

The suit involving the validity of the sale and transfer by this company in the year 1894 to the Philadelphia, Wilmington and Baltimore Railroad Company of 5,000 shares of the stock of the Union Railroad Company of Baltimore, has been terminated by a decision of the Court of Appeals of Maryland, fully sustaining the action of your company in this matter.

There are still pending the other suits referred to in the last annual report. The court in which these are pending has been asked to fix a time for their hearing, and this request we are advised will be considered.

With reference to the proposed disposition, as heretofore announced, of the security holdings of anthracite coal companies, in which your company and the Pennsylvania Railroad Company are respectively interested, an agreement has been reached for the sale of the lands leased to and operated by the Mineral Railroad and Mining Company, in which this company is interested.

Your company leased for 999 years from the Shamokin Valley and Pottsville Railroad Company, in addition to the railroad and other property thereby demised, certain coal lands in the vicinity of Mt. Carmel and Shamokin, Northumberland County, Pennsylvania. Pursuant to the authority conferred by such lease, it sublet these lands to the Mineral Railroad and Mining Company for the unexpired term of said lease terminating February 27th, 2862, but the Mineral Railroad and Mining Company has been unable to pay the royalties provided for in said sublease. No action, however, was taken looking to a termination of this sublease, due to the belief that better results would not follow a change of lesseeship unless your company would permit the lessee to mine only the profitable seams, and thereby considerable bodies of coal would consequently remain unmined and be ultimately lost.

During the past year your Board ascertained that the Susquehanna Coal Company was prepared to consider the purchase of the lands embraced in the lease if it could acquire the interests therein of the Mineral Railroad and Mining Company, of this company and of the Shamokin Valley and Pottsville Railroad Company.

The Mineral Railroad and Mining Company was prepared to assign all the interest that it had in the coal lands in question, and this interest has been assigned, effective January 1st, 1914, to the Susquehanna Coal Company. The interest which the Shamokin Valley and Pottsville Railroad Company had in these lands was almost a nominal one, inasmuch as all of the coal, if mining operations were continued upon the lands and the present rate of production maintained, would be mined and removed within fifty years, and the payment to which it is entitled under the lease is a fixed sum not affected by the amount of coal mined from these coal lands. The lands, however, were subject to a mortgage of the Shamokin Valley and Pottsville Railroad Company for $2,000,000, and in order that the Susquehanna Coal Company might acquire a title to the lands free and clear of all liens, it was necessary that this mortgage should be cancelled and extinguished. This company is the holder of all the bonds secured by this mortgage, part of which are held in the Coal Land Depreciation Fund and the balance in your treasury, with the expectation of their transfer to that fund as the lands are exhausted, and an agreement has been reached with the Shamokin Valley and Pottsville Railroad Company by which this company, in consideration of the conveyance to the Susquehanna Coal Company of the interest of the Shamokin Valley and Pottsville Railroad Company in the lands, will surrender to that company the $2,000,000 of bonds and the mortgage securing the same will thereupon be extinguished.

An agreement has also been reached between this company and the Susquehanna Coal Company by the terms of which the coal company will pay upon the acquisition of the interests of all of the three parties above named, a minimum price of $2,600,000, payable in the five per cent bonds of that company, exchangeable for its first mortgage bonds if and when the same are issued by that company, the actual price to be determined under the advice of an expert, appointed for such purpose by both parties, but who shall not be affiliated with either of the companies.

Your company has received from the Mineral Railroad and Mining Company $412,500 in repayment of advances heretofore made to that company, which sum has been credited to your profit and loss account. As no purpose will be subserved by continuing the corporate existence of the Mineral Railroad and Mining Company, steps will be taken looking to its dissolution.

The Susquehanna Coal Company will not purchase the railroad tracks leading to the several collieries located upon the coal lands above mentioned, and as the railroad of your company now reaches these lands and has larger markets upon its lines for the coal which will be mined therefrom, it should continue to enjoy the transportation of that tonnage.

Upon the completion of this transaction your company will have in its treasury securities of the Susquehanna Coal Company, with reascnable assurance that the interest thereon will be paid, and it will in addition be relieved from any obligation to furnish additional capital, which will no doubt be required to operate the mines and make future improvements. The sale to the Susquehanna Coal Company is also made to insure the continued operation of the unprofitable and well as the profitable mines, and thereby conserve the coal supply, and so that should the securities of that company, held by the railroad companies be sold, the new owners will obtain possession of the property subject to such mining obligations.

The company sold its 10,487 shares of Baltimore and Ohio Railroad Company common stock and 10,000 shares of preferred stock, having a total par value of $2,048,700.00, and received in payment therefor 18,487 shares of the capital stock of the Southern Pacific Company, having a par value of $1,848,700.00. In completing the transaction the stock of the Southern Pacific Company was valued at par, the common stock of the Baltimore and Ohio Railroad Company at the same figures, and the four per cent preferred stock at $80 per share, which was its approximate market value. The company is receiving greater dividend returns from the ownership of the Southern Pacific Company stock, and it is a security that under stable business and financial conditions can, no doubt, be sold on terms advantageous to your company.

During the year your company acquired $270,000 par value of Norfolk and Western Railway Company convertible 10-25 year four and one-half per cent gold coupon bonds.

Details of the organization changes, and statements covering the financial, traffic and operating results will be found in full in the annual report.

By order of the Board,
Samuel Rea,
President.

An "Accident-Proof" Railway in England

(From our London Correspondent.)

THREE years ago A. R. Angus, a wealthy Australian, came to Great Britain with the firm intention of building an accident-proof railway. He leased twelve miles of permanent way from the West Somerset Mineral Railway at Watchet, purchased two powerful locomotives from the Great Western Railway, and quietly but with untiring energy proceeded to solve the problem.

At the time when the public mind was deeply stirred by the Aisgill accident and the revelations at the subsequent inquiry Mr. Angus wrote to the London *Daily Mail* announcing boldly the realization of his ambition.

It has been sought to provide devices which shall be proof against the failure of the man or the machine, and which are reliable, simple and cheap. The two locomotives have for a long period been run daily at express speeds over the prepared tracks until conclusive results have been obtained. A train equipped with the apparatus can run at the highest speed permissible in accordance with safety and will be fully protected even in a dense fog.

The *Daily Mail*, which had already raised the question whether some means of automatically stopping a train when the signals stand at danger could not be introduced, at once sent a representative to Watchet. At Mr. Angus's invitation this representative rode in the cab of one of the engines over the "fool-proof" system. He thus recounts his experience.

The little railway is entirely devoid of the ordinary signals. At first we ran at the rate of sixty miles an hour over a track clear of traffic, passing over the three sections into which the line is divided. As the engine entered each section a bell with a deep note sounded denoting that the line was clear.

"Now," said Mr. Angus, "we shall see what happens when another engine is on the line." He rang through from a control box to headquarters and instructed the driver of the other locomotive to run into a section. It is a single-line railway, so the second locomotive was on our line direct ahead.

"We will make a rush at speed for that engine," said Mr. Angus. "The driver will pretend to take no notice of it and we will see what happens." The driver opened the throttle and the locomotive started off. Its speed became greater and greater. Ahead on our line was the other locomotive. There seemed no apparent reason why we should not crash into it. Then suddenly the whistle of the engine shrieked; yet the driver had touched nothing in the ordinary course.

This shrill whistle would be the warning to the driver that he was in immediate danger, but our driver for the occasion was supposed to be deaf. A moment or so after the whistle there came a hissing of steam and the grinding of brakes. The engine slowed abruptly and stopped dead. Still the driver had touched nothing. The brain of the engine saved us from disaster.

How it is all done became evident from an examination of the permanent way and control boxes. Each section of the line is guarded at both ends by three ramps (metal contrivances between the rails), which are connected by telegraph wires to an instrument in a control box. The locomotive is also fitted with an electrical contrivance brought into contact with the ramp by a shoe depending from the engine. The brain of the engine automatically telegraphs to the instrument in the control box, which instrument telegraphs back that the section is free from traffic. A bell rings in the cab of the engine to notify the driver.

If, however, the section is blocked, the brain in the same way causes a whistle to blow, when the driver should stop the train. If he fails to do so, then, and only then, does the locomotive, by means of the electrical contrivance take the control out of his hands. It shuts off steam and applies the brakes. He cannot then drive until freed by some responsible person at a control. In the controls everything is similarly automatic.

The system absolutely eliminates the personal element. If the driver makes an error the train stops.

In commenting on the narrative thus given by its representative of the working of the "foolproof" railway, the *Daily Mail* put several questions with regard to Mr. Angus's invention. Could it be applied on a scale large enough to cover the innumerable complications of an ordinary railway system? How great is the liability to error? What is the cost of the installation?

To these questions Mr. Angus at once replied in a long and very interesting letter. He wrote: I would say definitely as a result of my years of study of this problem, that every form of railway operation now required to be carried out on any class of railway tracks can be carried out by means of these inventions, in which the risk due to the man or the machine will be eliminated and the cost of installation and maintenance will be comparatively small.

As regards question (2) that is, its liability to error: In the first place we have the fact that the devices used are well known devices (adapted to my needs) whose operation and life's working and history have been recorded for many years past, and by their wide use in most countries of the world answer the question as to their practicability and reliability for general public use.

One of the series of tests carried out by my staff, as directed, consisted in locking up in a suitable box the apparatus by which the locomotives automatically protect themselves from collision. These locked-up instruments were not looked at, let alone touched by my staff, for several months at a time, and the locomotives were driven up and down the tracks daily, at speeds varying from very slow to express speed, and the results were excellent, as no delay to traffic arose during that period. The locomotives giving emphatic "line clear" and "all in order" indications. Other tests consisted in interfering with or deranging the apparatus, cutting out the generator, short circuiting, destroying connections, etc., and the locomotives invariably have in the tests in question a danger intimation, and on ignoring these danger intimations each locomotive invariably shut off its steam and applied brakes.

As regards question (3)—viz., the cost of installation: To answer this question definitely one must have plans of the proposed installation, as railway tracks of necessity differ in class, e. g., (a) single tracks, (b) double tracks, (c) sidings, (d) junctions, (e) termini. The most difficult case, in my opinion, and contrary apparently to the generally accepted idea, lies in the equipment of single railway track, that is track on which a train may in turn run in either direction along the same single tracks, as we have to consider not only safety but traffic problems of no mean order.

The actual cost of equipping single tracks as mentioned (assuming that the sections for some thousands of miles average four miles) should not exceed thirty pounds ($150) per mile, if apparatus such as I have early employed at Watchet be used. The price will vary more or less according to the length of average section used and according to which type of my apparatus is finally used. The cost of equipping the average locomotive should not exceed twenty-five pounds ($125) per locomotive but may be increased or decreased in cost according to the type of appliances used.

In some British railways more than one locomotive per mile of track is used, but in many cases the average appears to be about one locomotive to each two miles of track, and in this latter case, if we add the cost of the locomotive to each mile of track equipped, then the actual total cost should not exceed about $225 per mile equipped with the apparatus for single tracks as mentioned.

The final claims of inventions such as these, and, indeed, of all contrivances for increasing the safety of those who travel on our railways, must, of course, be judged by the companies themselves. Past experience, however, goes to show that the companies have not been always very eager to encourage the inventor or in this great age of mechanical progress to march with the times and bring their antiquated systems up to date.

ANNUAL MEETING NOTICE.

UNITED STATES RUBBER COMPANY.

New Brunswick, N. J., February 6th, 1914.

Notice is hereby given that the Twenty-second Annual Meeting of the Stockholders of the United States Rubber Company will be held at the principal office of the Company, in the City of New Brunswick, New Jersey, on Tuesday, March 17th, 1914, at 12 o'clock noon, for the election of Directors and for the transaction of any and all business that may properly come before the meeting, including considering and voting upon the approval and ratification of all purchases, contracts, acts, proceedings, elections and appointments, by the Board of Directors or the Executive Committee since the Twenty-first Annual Meeting of the Stockholders of the Company on May 20th, 1913, and of all matters referred to in the Twenty-second Annual Report to Stockholders, which will be sent to Stockholders before the meeting, and in the proceedings of the Board of Directors and the Executive Committee, which until the meeting, will be open to examination by Stockholders of record during business hours at the New York Office of the Company, 1790 Broadway.

The Transfer Books will not be closed, but the New Jersey Corporation Law will not allow to be voted any share of stock which shall have been transferred after February 25th, 1914.

By order of the Board of Directors.

SAMUEL NORRIS, Secretary.

NEW TRAFFIC BOOKS

Practical
Readable **THE BIG 4** Up-to-date
Convenient

Four new texts on Traffic have just been published. They have four qualities that should make them sought for by all traffic men—*They are practical and up-to-date. They are convenient and readable.* The books are: 1.—**Freight Classification,** by E. R. Dewsnup, Professor of Railway Administration, University of Illinois; 2.—**Freight Claims,** by W. A. Trimpe, a Chicago Lawyer, experienced in this line; 3.—**Routing Freight Shipments,** by J. F. Morton, Traffic Manager of the Chicago Association of Commerce; 4.—**Reducing Freight Charges to a Minimum,** by J. F. Strombeck, President of the Strombeck-Becker Mfg. Co.

These books form in part the basis of our **course of instruction by correspondence in Interstate Commerce and Railway Traffic.**

VOL. LVIII. MARCH, 1914 No. 3

Important Developments in the Transportation Field

ANNUAL MEETING OF UNITED STATES CHAMBER OF COMMERCE

The second annual meeting of the Chamber of Commerce of the United States of America which was held in Washington, D. C., on February 11, 12 and 13, proved by far the most important business gathering of the present calendar year. The attendance was remarkable and the members listened with the closest attention to the discussion of the various industrial and commercial problems which came before the organization.

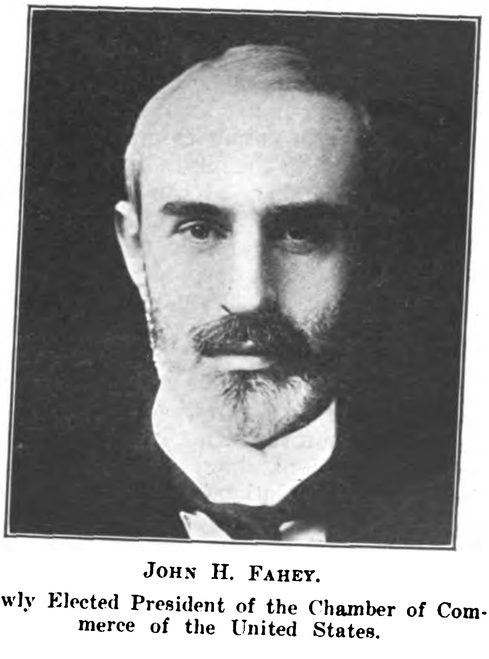
Too much importance cannot be placed upon the activities of this body. Composed as it is of prominent business men from all sections of the country, it represents in no small measure the industrial backbone of the United States and the alert manner in which its members are discussing the problems in which are involved economic justice and progress, should act as a healthy check upon politicians of demagogic tendencies. The interest which is being taken in the work of this organization is strikingly indicated by the growth in its membership. On May 31, 1912, the National Chamber consisted of forty-four organizations with 37,472 members in fifteen States. On January 31, 1914, it consisted of 506 organizations with 244,870 members in forty-seven States.

The second annual meeting was of such a character as to constitute a most important step in the progress of the federation of the organized business forces of America. The report of the Board of Directors indicated masterly activity in the direction of great public questions and showed the ability of the National Chamber to stimulate in the most effective form, present day business opinion on matters of great National moment.

President Harry A. Wheeler, who has so ably represented this organization during the past two years, was succeeded by Mr. John H. Fahey, of Boston, who was a leading force in all conferences in Washington and elsewhere that preceded the organization meeting of April, 1912, and who has been chairman of the executive committee for two years.

The first and second sessions were devoted to the report of the Board of Directors, the address of President Wheeler and to the reports of the committees on patents, trade marks and copyrights; banking and currency; and statistics and standards. An impressive feature of the second session was provided in the four speeches dealing with the methods of commercial organizations.

The third session, held on the evening of February 11th, proved of great interest not only to the members but to a great many visitors on account of the addresses delivered by public officials. The Honorable William P. Wilson, Secretary of Labor, spoke on "The Relation of the Department of Labor to Industries and Commerce." His speech strongly developed an argument relative to the mutuality of interest existing between labor and capital. He pointed out that disputes between these elements have to-day become more acute because of the almost complete disappearance of personal relationship between employer and employe and he asserted that one of the purposes for which the Department of La-



JOHN H. FAHEY.
Newly Elected President of the Chamber of Commerce of the United States.

bor had been created was to step in when relations become strained and offer its good offices in an effort to bring the contending parties together. He pointed out that when a stoppage of work takes place it means an economic loss which involves not only the employers and employes, but the entire community of forces that ought to be valuable in producing valuable economic results. Secretary Wilson suggested that a great deal depends in getting the conflicting parties to work out their problem themselves and in getting them to realize the mutuality of their interests. This he pointed out develops a spirit of co-operation which is bound to prove beneficial. If they fail to agree, however, it then becomes the duty of the new department to act as a mediator not for the purpose of imposing either upon the employer or employe the particular views of the department, but for the purpose of trying to find some mutual basis upon which the two parties may agree.

The second impressive speech of the evening was delivered by the Honorable Charles A. Prouty, Chief of Valuation of the Interstate Commerce Commission on "Physical Valuation of Railroads," and is reproduced in full in another section of the issue. Mr. Prouty's address gives an understanding of the vast task involved, the time required for its completion, the estimated expense and the motives that prompted the legislation. It will be read with much interest by all railway officials.

Another important feature of this session was a speech from the floor delivered by Bernard J. Shoninger, president of the American Chamber of Commerce in Paris. His remarks dealt in a general way with the intricate trade relations existing between this and European countries and he urged National interest in the Sixth International Congress of Chambers of Commerce to be held in Paris in June.

The morning and afternoon sessions of February 12th, were devoted to a discussion of anti-trust legislation and it was apparently the consensus of opinion of the members present that they had never participated in a more valuable meeting nor had the great industrial questions of the day been placed before them more clearly. These two sessions should have a marked effect upon the National mind relative to the problems involved in anti-trust legislation. The speakers, each in his own way, developed some phase of the subject and their addresses taken altogether practically covered the tremendous problems involved in, first, concentration of industry in the United States; second, interlocking directorates and holding companies; third, the rights of private parties to make use of Government action under the Sherman law; fourth, the proposed interstate trade commission, and fifth, the question of industrial efficiency of the trust form of business organizations.

The subject was opened for discussion by the Honorable William C. Redfield, Secretary of Commerce, who it is interesting to note, regards the trust form of organization as having great possibilities of industrial efficiency involved in it. Mr. Redfield was followed by President Charles R. Van Hise, of the University of Wisconsin. The speech as a whole, represents a demand for clearer definition of terms so as to avoid action based upon misapprehension. Mr. Victor Morawetz, of New York, delivered the next address in which he traced the history of the changes in interpretation of the Sherman law between 1895 and the present time. The thought running through the address of Mr. Frederick P. Fish, former president of the American Telephone and Telegraph Company, was that research should precede legislation. Mr. Henry R. Towne, president of the Yale and Towne Manufacturing Company, and former president of the Merchants' Association of New York City, and Mr. Guy E. Tripp, chairman of the Board of Directors of the Westinghouse Electric Manufacturing Company, dealt, in different forms, with an analysis of the present proposed anti-trust legislation. These speakers were followed by Professor Henry R. Seager, of Columbia University, of New York City, who held closely to a discussion of the proposed interstate trade commission, its scope, its possibilities, both favorable and dangerous. The closing address of this symposium on anti-trust legislation was delivered by Mr. Louis D. Brandeis, of Boston.

The annual banquet was held on the evening of February 12th, and was attended by 370 delegates, guests and ladies. Two speeches were delivered, one by Secretary Redfield, of the Department of Commerce, and the other by Professor Doctor Karl Rathgen, of Hamburg, Germany. Secretary Redfield's address was largely confined to a review of the activities and broadening scope of the Department of Commerce, while the remarks of Professor Rathgen drew marked attention to the caution with which Germany is proceeding, in the matter of control of corporations and, by implication, the necessity for caution in this country.

The sixth and seventh sessions were devoted largely to the discussion of the maintenance of resale prices and to the reports of committees on fire waste and vocational education.

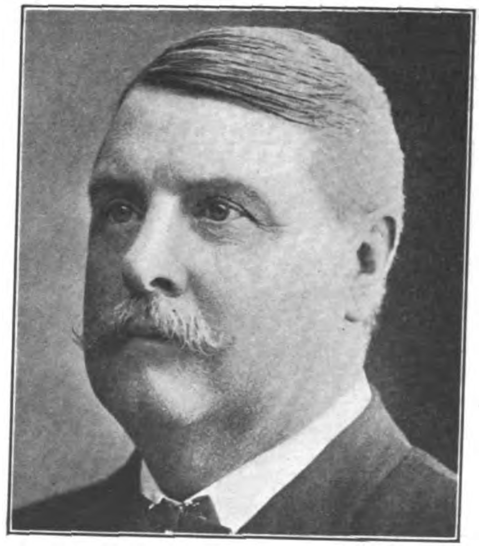
Two new vice-presidents were elected, namely, A. H. Mulliken, president of the Pettibone-Mulliken Company of Chicago, and Robert F. Maddox, of Atlanta, Ga.

THE VALUE OF THE EXPRESS COMPANIES' SERVICE

A few months ago, at the time of the inception of the parcels post, the criticism against the express companies was so general and so virulent as to make it appear that the vast service which these companies had been so efficiently rendering for many years, could be readily disposed of by a more extended employment of the parcels post.

More recently, however, business has begun to realize that the general "baiting" of express companies is not only unwarranted by facts, but that the service which they have and are performing, is indispensable and is being seriously threatened by some restrictive measures already enacted and others of a more radical tendency now under consideration. The article which we publish elsewhere in this issue by William A. Marble, president of the Merchants' Association of New York, is well worth the serious consideration of all those who are interested in protecting the efficiency of our present important arteries of trade. Mr. Marble argues in favor of the indispensable value of the express service and opposes at the present time the further extension of the parcels post system. As Mr. Marble points out, there are certain services performed by express companies which would be impossible to attempt by the parcel post and to wantonly destroy such service would constitute an inexcusable blunder on the part of the Government, to say nothing of the actual injury which would be done to the general public, to the express companies and to the investors in express company securities. The following editorial taken from a recent issue of *Leslie's Weekly*, is of particular interest in this connection:

> Are the public quite ready for some of the revolutionary propositions now being discussed in high circles in Washington? Are the people prepared to pay the tremendous bills for the exploitation of experimental schemes on the part of those who have never yet achieved a record in the world of business and finance, and whose ambitions have lain wholly in the realm of politics?
>
> Is this Government so efficiently managed that it is to be trusted by the people with all of its public utilities, including the express business, the telephones, and telegraphs? We do not believe so. What a billion dollar Congress would do with such an opportunity to spend the people's money defies the imagination to depict. We have just begun to experiment with the parcels post. We are told that it is a great success. That remains to be seen. We call the attention of shippers to the fact that their interests are at stake in this matter more than those of any other class.
>
> It is interesting to recall just what the express companies of this country have been doing for so many years. As far back as a quarter of a century ago, in a decision of the United States Supreme Court, one of its eminent judges paid this tribute to the express business of the United States: "It has become a public necessity, and ranks in importance with the mails and with the telegraph. It is used in almost every conceivable way and for almost every conceivable purpose by the people and by the Government. All have become accustomed to it, and it cannot be taken away without breaking up many of the long-settled habits of business and interfering materially with the convenience of social life." This is a remarkable statement, but the history of the express business abundantly justifies it, and now more than ever before.
>
> What have the express companies done for the producer and the shipper? They were among the first to suggest the possibility of raising fruits, berries and vegetables and of shipping them to meet the public demand. They did the work of the pioneer in encouraging production and in bringing the consumer and producer in closer contact by carrying freight on fast trains, assuring a uniformity of moderate rates and giving to perishable goods a market that could not otherwise have been had. Special cars for horses and carriages, refrigerator cars for perishable products, large end-door cars for automobiles and



WILLIAM A. MARBLE.
President of the Merchants' Association of New York.

"SAFETY TRUNKS" BEING FILLED WITH FRAGILE PACKAGES FOR TRANSMISSION BY EXPRESS. THE PARCEL POST HAS NO SUCH PRECAUTION.

aeroplanes, a through service from coast to coast without a moment's delay to tranship, travelers' checks (good in every land), personal service for the traveler abroad or at home, and expedited service for the shipper in any emergency—these are some of the achievements of the express companies which the public may not fully recognize, but which stand to their everlasting credit.

We doubt very much whether, with the knowledge of these facts, the people of this country are prepared to see the express companies driven out of business. And we have still graver doubts whether any service rendered by Government employes can ever be as uniformly satisfactory and as reasonable to the shippers, and to the public generally, as that which now obtains under the efficient management, which all the world concedes to the express companies of the United States.

Nobody claims that these companies are without their faults. There is no such thing as 100 per cent efficiency in any line of business, but with the knowledge of the loose, unbusinesslike and extravagant methods which prevail so often in governmental service, the public has come to know and believe in the superior methods of the efficiently managed corporation.

WAGON SHOWING THE "PICK-UP" SERVICE OF THE EXPRESS COMPANIES. THE PARCEL POST HAS NO PICK-UP SERVICE.

So much, at least, is due to the express companies of the United States.

The Merchants' Association of New York, of which Mr. Marble is president, has also memorialized Congress in behalf of the preservation of the service performed by the express companies. The following, which appears in their official organ of March second, outlines the reasons why this organization considers it necessary to take this action:

After a careful inquiry into the situation, the Association found that the extension of the parcels post service threatens to drive the express companies out of business. The extinction of their service would be a serious loss to merchants, as it performs functions which the parcels post does not and probably cannot perform.

ABOLITION WOULD CRIPPLE BUSINESS.

The Merchants' Association took the lead in the movement which led to the reorganization of the express service and the revision and reduction of express rates. The orders issued by the Interstate Commerce Commission have made this service efficient and the charges reasonable. Its abolition would seriously cripple the business of shippers.

Having given the matter the most careful consideration, the Board of Directors of the Association at its last meeting decided to appeal to Congress. It adopted resolutions briefly setting forth the situation and supplemented them by a memorial in which the service performed by the parcels post and that of the express companies is discussed and contrasted.

DIRECTORS TAKE ACTION.

The resolutions adopted by the directors were as follows:

"WHEREAS, The Postmaster General is empowered by law at his discretion to determine the weight limit of parcels which may be transmitted by mail, to make regulations relating thereto and to fix and change the rates therefor, and

"WHEREAS, The parcels post, although useful and desirable within its present limits, is by reason of numerous limitations unfitted effectively to meet all the needs of commerce for quick transportation, and

"WHEREAS, The express service fully provides for those needs in a highly efficient manner and at rates fairly proportioned to the cost of rendering the service, and

"WHEREAS, The extension of the parcels post weight limit to 100 pounds would so deplete the volume of traffic available to the express companies as to make their operation profitless and force their retirement;

"*Resolved*, That in the opinion of this Board, the express service is an indispensable agency for quick transportation, whose continuance is imperatively required by the needs of commerce, that the parcels post as at present organized, would be a wholly inadequate substitute, inferior in many respects to express service; that it is lacking in many important features essential to a complete service, and being unadapted to many classes of traffic, its substitution would leave that traffic unprovided for;

"*Resolved*, That if the parcels post be so expanded as to cover the entire field of quick transportation it cannot in any event perform that function more efficiently or economically than it is now performed by the express companies and in all likelihood the cost will be greater;

"*Resolved*, That in the opinion of this Board no social or economic benefit will result from substituting the parcels post for the express service beyond the limits now established, but that on the contrary serious harm to the country's traffic facilities will ensue with a probable loss resulting from the parcels post's operations, to be borne by the public treasury;

"*Resolved*, That the further extension of the parcels post be opposed by this Association and that the reasons for such opposition be stated in full in a proper memorial to Congress."

The memorial which the Board directed to be prepared is signed by Mr. W. A. Marble as president of the Association, and it has been sent to every member of Congress.

CORRECTING A MISLEADING STATEMENT

It will be remembered that in the RAILWAY WORLD of November attention was called to a statement made by Clifford Thorne, chairman of the Iowa Railroad Commission, and given wide publicity, to the effect that the railways of the United States could be purchased by the Government for approximately $14,000,000,000 and that Government bonds to that amount could be issued at a rate that would require an annual interest charge of only $420,000,000, or three per cent. President Ripley, of the Atchison, took vigorous exception to this estimate of Commissioner Thorne's and in two open letters, which were also published in the RAILWAY WORLD, clearly showed how misleading were the figures employed by this gentleman as were his conclusions drawn therefrom. It is of interest to note that Charles A. Prouty, who was formerly chairman of the Interstate Commerce Commission, and has now charge of its valuation work, in a recent address at Cleveland in which he vigorously opposed Government ownership, made a statement to the effect that the probable cost to the Government in the event of their purchase of our railways would be about $20,000,000,000, on which the interest charges would be likely to be about $600,000,000. Mr. Prouty employed an interest rate of three per cent, which was the same as that used by Mr. Thorne, but even on this extremely doubtful assumption that the Government could sell bonds in such vast amounts at such a low rate of interest, there is a wide difference between their figures. As a matter of fact, it is highly improbable that the Government could dispose of such bonds at a rate below three and one half per cent.

Mr. Prouty's figures were, of course, intended only as a rough estimate of the valuation of the railways, but it is recognized that perhaps no other Government official is better able to make such an estimate, and it is at least significant that he had sufficient confidence in its approximate accuracy to employ it in his argument against railway nationalization. It is also of interest to know that his valuation figures were the same as those employed by President Ripley in his reply to Commissioner Thorne, while his interest figures are much nearer those of Mr. Ripley's than of the Iowa Commissioner's.

Mr. Prouty is evidently not the only high official connected with the Interstate Commerce Commission who is at the present time, opposed to Government ownership. Chairman Clark, of that Commission, in an address last month before the Traffic Club of Philadelphia, was also quoted as opposed to Government ownership largely on account of the fact that experiments along these lines have not always proved satisfactory in foreign countries.

THE RESPONSIBILITY FOR RAIL FAILURES

A few months ago, owing to the numerous rail failures which had occurred in various sections of the country often causing wrecks of a disastrous character, press criticism of the railways became unusually severe and it was stated on more than one occasion that the load being put upon the rails was too severe for safe operation. It was also stated, —and in this criticism there was a disagreeable undertone, that in the interests of economy and in order to make rails last longer, the railroads were ordering those of such extreme hardness and brittleness as to often invite the breakage so frequently reported. Recent investigations, however, would seem to largely discredit such criticism and to indicate that the blame for such failures rested largely in imperfect manufacture, rather than in either the weight of the load or the quality of the rail. In other words, rail failures in a number of instances lately have been found accompanied by transverse fissures which have apparently been the cause of such breakages, and while James E. Howard, engineer physicist of the Interstate Commerce Commission, has, in a number of investigations, reached the conclusion that these fissures were the result of overloading the rails, railroad officials have generally disagreed with such conclusions, and an extensive investigation recently conducted by Doctor Dudley which is published in the *Railway Age Gazette* of February 27th. appears to conclusively show that fissures are the result of imperfect manufacture rather than the strain put upon the rails. In brief, the conclusions reached by Doctor Dudley are that internal transverse fissures in rails are created primarily by careless and defective mill practice. Furthermore, a more recent report of Mr. Howard would tend to support these conclusions, as in his report on the wreck on the Southern Railway near Oyama, N. C., he makes the significant statement that although it was necessary to remove eighteen rails, only the one in which the internal fissures was found was broken and the rest were twisted and bent without breaking. It would appear from the foregoing that the responsibility for this dangerous type of failure is at last being placed where it belongs, namely, upon the shoulders of the manufacturers.

MISLEADING PRESS REPORTS

It is unfortunate that so much information of a misleading character is published in the daily press with reference to the cases which are constantly coming before the Commission or the courts relative to various allowances which it has been the practice of carriers to allow for services performed in the transportation of freight. Many of these cases are of a purely technical character and the railroads themselves often take the initiative in requesting the Commission to decide whether such allowances are legal under the interstate commerce law.

It is well within the truth to state that rebating, in its objectionable sense, has practically disappeared from railway operations and yet, with regard to many of these cases it is made to appear that the carriers are constantly resorting to these objectionable practices. A recent decision by the Interstate Commerce Commission in which the Pennsylvania Railroad was involved, led a number of newspapers to either ignorantly or maliciously report this road as having been found guilty of resorting to secret rebates.

Such an interpretation of the Commission's decision is far from the truth as is indicated by the following statement authorized on January 28th, by Samuel Rea, president of the Pennsylvania Railroad Company:

> It should be clearly understood by the public that the decision of the Interstate Commerce Commission published to-day concerning allowances to short lines of railroad serving industries, does not contain any suggestion that the practices detailed therein constituted secret rebates.
>
> The rates covering the allowances by the railroads to these short industrial lines have been published and on file with the Interstate Commerce Commission, and were and are, therefore, a matter of public record.
>
> The Commission itself, in the full opinion, makes this statement:
>
> "It is proper to say that the whole matter was voluntarily brought to our attention by certain of these industries and the line railways which serve them.
>
> "The demands of plant railways for larger allowances, the increasing number of industries that were incorporating railroad companies to take over the operation of their plant tracks and locomotives with a view to demanding allowances, and the growing volume of complaint against the discriminations arising out of these relations between the line carriers and the industries so favored, together with certain formal and informal rulings by the Commission in other cases, had combined to raise a doubt on the part of the carriers and the industries as to the legality of these allowances and free service."
>
> The entire situation was laid before the Commission by the railroads and industries involved three years ago, no method of solving the peculiarly complicated questions involved having been worked out by the carriers and the industries, who had for many years previously recognized that a more definite and systematic treatment of the whole problem was necessary.
>
> In the briefs filed on this subject on behalf of the Pennsylvania, the New York Central, the Baltimore and Ohio, and the Erie Railroad systems, the following suggestion was made by the railroads themselves:
>
> "The payment of any allowance for the performance of this service inevitably creates suspicion, gives rise to complaints, and the only way to effectually deal with the problem is to abolish all allowances for the performance of this ser-

vice either by the industry itself, or the industrial railroad."

There was no secrecy about any phase of the subject. The effort of all concerned was solely to obtain the assistance of the Commission in removing an honest doubt on the part of the railroads and the industries affected as to the proper policy to be pursued.

THE SITUATION IN TEXAS

For a number of years the railway situation in Texas has been far from satisfactory. Regulation has been of an unusually severe and restrictive character and while public sentiment during the past two years has largely swung over to the side of the carriers, those in authority appear reluctant to adopt policies which would have a truly stimulating and progressive effect. Notwithstanding the fact that during 1913, Texas stood second in new mileage constructed with a total of 424 miles, this vast area which represents an empire within itself, is far from being adequately supplied with railway facilities, with the result that its vast natural resources remain practically undeveloped and its business and commercial opportunities are being abnormally restricted. This is strikingly indicated by the statement that during 1913, six counties of the State got their first railroad, while there are still twenty-seven counties with a combined area of 32,000 square miles without a single mile. In other words, Texas has an area equivalent in size to that of the State of Indiana in which the whistle of the locomotive has never been heard.

The general managers of the railroads of Texas, realizing in a way the public cannot, the restrictive influence of this lack of development, have recently published the following statement as an advertisement in the daily papers of general circulation throughout the State. It constitutes a straightforward appeal for fair treatment and should assuredly meet with the sympathy and support of the people of that great State whose own interests and prosperity are so closely associated with those of the carriers:

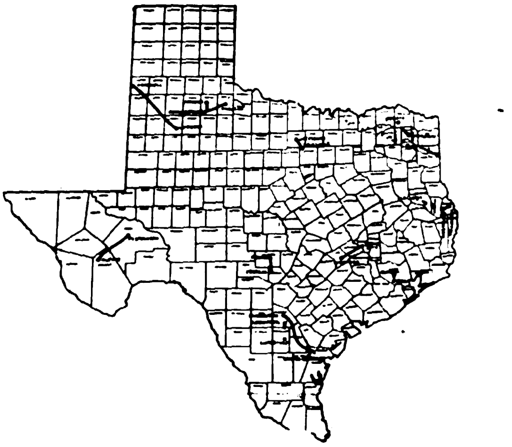
To the People of Texas.

President Woodrow Wilson, in his message to the Congress of the United States, on January 20, 1914, said: "The country is ready to accept and accepts with relief, as well as approval, a law which will confer upon the Interstate Commerce Commission, the power to superintend and regulate the financial operations by which railroads are henceforth to be supplied with the money they need for their proper development to meet the rapidly growing requirements of the country for increased and improved facilities of transportation. We can not postpone action in this matter without leaving the railroads exposed to many serious handicaps and hazards; and the prosperity of the railroads and the prosperity of the country are inseparably connected."

President Wilson, with his wonderful fund of information and keen foresight so characteristic of the man, sees the necessity for the railroads of the country to be supplied with more money, which they need and must have for their proper development, and in order to meet the growing requirements of the country for increased and improved facilities of transportation, and he further recognizes the fact that the country cannot prosper unless the railroads are permitted to enjoy a reasonable degree of prosperity, for he says: "The prosperity of the railroads and the prosperity of the country are inseparably connected."

While the President evidently favors a law which will empower the Interstate Commerce Commission to enable the railroads to obtain necessary funds for their proper and efficient operation, the Texas railroads are not in a position to await action by Congress. Besides, such action by the National Government is not necessary in this State. You have provided a railroad commission, and conferred upon it the powers, so far as Texas is concerned, that President Wilson thinks ought to be conferred upon the Interstate Commerce Commission, regarding the United States as a whole. Besides, there are a great many people who believe that the regulation of our internal affairs should be confined to the State and not conferred upon the National Government. This presupposes, of course, that the servants whom the people have elected to office will act promptly as occasion arise; otherwise action by the Federal Government will become imperative.

It costs a great sum of money to operate the railroads of Texas, and inasmuch as you annually pay all of the expenses of operating the railroads, you are entitled to know whether the railroads



Map of Texas, Showing New Mileage Constructed in 1913.

are collecting more than is just and reasonable under the circumstances.

Under the law, the railroads are entitled to collect enough to pay all operating expenses, taxes, etc., and in addition thereto, a fair return on the value of the property devoted to public use. Your tax commission, created by you, and acting under their oaths of office, has found that the true value of the railroads of Texas is $30,000 per mile. We believe they are of greater value. According to Table No. 10, page 400 of the Twenty-first Annual Report of the Railroad Commission for the year 1912, the total cost of the construction and equipment of the Texas railroads up to June 30, 1912, was $582,388,949,99, which shows that the roads have cost their owners a little over $38,000 per mile. But, taking $30,000 per mile, which the tax board says is the true value of the roads, as a basis, the railroads of this State, for the year ending June 30, 1910, earned 4.30 per cent on that value. For the year ending June 30, 1911, they earned 4.16 per cent; for the year ending June 30, 1912, they earned 3.97 per cent. Out of these earnings the companies must pay the interest on their bonds and other indebtedness and if it is not sufficient, they are forced to borrow the money, or default in interest payments. For the year ending June 30, 1912, the shortage amounted to a little over three and a quarter million dollars, and for the year ending June 30, 1913, the shortage amounted to something over one million six hundred thousand dollars. And for the first five months of the year beginning July 1, 1913, the railroads are over four million dollars behind what they were at the end of the corresponding five months of the year beginning July 1, 1912, so that if they break even for the balance of the year, their deficit for the year ending June 30, 1914, will be nearly six million dollars. However, they cannot hope to break even, because the month of December with its disastrous floods and loss of business has not yet been taken into account.

We are anxious to continue to give the people at least as good service as heretofore; in fact, we want to improve that service, but it is apparent that we cannot do so unless we can obtain more money from the operation of the roads. We have reduced operating expenses all we can. Further reductions of expenses must come, if at all, by the help of the people, the Legislature, the courts and the juries. The crisis has been reached where we must have more money, or else be unable to give the people adequate, safe and reasonable service. Poor service naturally gives rise to bitter complaints, and as your servants, we believe you are entitled to know the truth of the situation with which we are confronted.

Former Interstate Commerce Commissioner Prouty, now at the head of the railroad valuation department of that body, recently said.

"The railroad is a public servant. That phrase comes to us from the Supreme Court and has been for a quarter of a century in the mouth of everybody who has to do with this subject. It comes, as time goes on, to take on a different meaning. Originally, the people said: 'The railroad is our servant, therefore we can kick the railroad and cuff the railroad ad libitum.' It is coming to be understood, gentlemen, that just as your servant can only properly discharge his duties when he is suitably fed, suitably clothed, and siutably housed, so the railroad can only properly discharge its duties when it receives proper treatment from the public. It is coming to be apprehended that in the final analysis, the public pays the bill and that it pays for us, as railroad commissioners, to accord to the railroad just and fair treatment. That, I say, is not only demanded by justice—it is demanded by public interest."

Former Interstate Commerce Commissioner Franklin K. Lane, now a member of President Wilson's Cabinet, said:

"The railroad is our common high-road; it is not a luxury; it is not a concern in which the farmer and the manufacturer alone is interested; it is an essential to the commercial life of our people, almost as necessary as the land itself, for we have grown up as a people to be physically dependent upon our railroads. No other people are so bound up as we are in economic interdependence. No one community in all this land live to itself. We have grown as railroads are built. We have made a community of a continent."

Ex-President Theodore Roosevelt recently said: "The great need of the hour, from the standpoint of the general public—of the producer, consumer and shipper alike—is the need for better transportation facilities, for additional tracks, additional terminals and improvements in the actual handling of the railroads, and all this with the least possible delay. Ample, safe and rapid transportation facilities are even more necessary than cheap transportation. The prime need is for the investment of money which will provide better terminal facilities, additional tracks and a greater number of cars and locomotives, while at the same time securing, if possible, better wages and shorter hours for the employes. There must be just and reasonable regulation of rates, but any arbitrary and unthinking movement to cut them down may be equivalent to putting a complete stop to the effort to provide better transportation."

The State having taken over the regulation of the railroads and the fixing of rates is under both legal and moral obligations to discharge that duty so as to enable the railroads to earn a fair return on the value of their property, and give to the public the best and safest transportation service possible. This is all we ask, and we submit that the railroads and the public are justly entitled thereto.

PUBLIC UTTERANCES BY PROMINENT OFFICIALS

A number of Government and railway officials were active during January and February in giving public expressions of their views on various phases of the railway problem. One of the most important utterances by a public official was that by Charles A. Prouty, before the Annual Convention of the Chamber of Commerce of the United States, held in Washington in January on "Railway Valuation." This is reproduced in full in another section of this issue. Ivy L. Lee, executive assistant to the president of the Pennsylvania Railroad, also delivered a number of addresses in various sections of the country, one of which, entitled "The Burden of Unnecessary Legislation," is also presented at length in another section. The new president of the

FAIRFAX HARRISON.
President, Southern Railway.

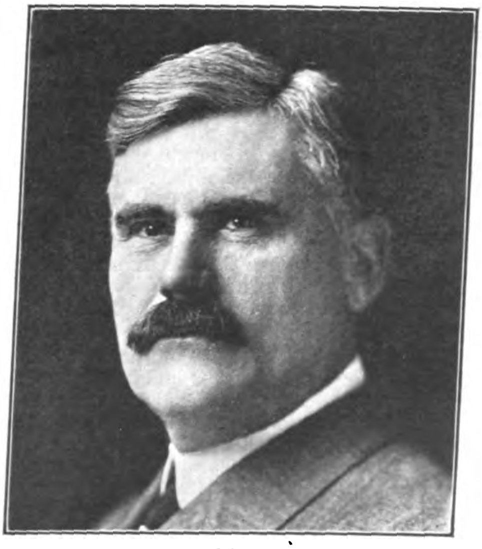
Southern Railway, Fairfax Harrison, spoke at the annual banquet of the Chamber of Commerce, Chattanooga, Tenn., on January 20th, on "The Southern Railway in Its Relation to the People of the South." He clearly indicated how intimately the prosperity of this great system and that of the people of the South were intertwined, referring particularly to the vast expenditures of money involved in the payment of salaries, construction work, the purchase of new material, taxes, dividend and interest requirements. In closing his address, Mr. Harrison said:

> I am humbly grateful for the welcome the South has given me to my new opportunity for its service. It has been such a welcome as you have given me to-night, cordial and with every evidence of good will. My hope is to justify this to those who allow me their confidence, who are willing to believe that if we sometimes fail it will not be through lack of good intention or desire to do our duty as we conceive it. I have no sense of personal elation in the realization to-day of an ambition cherished ever since I entered the service of the Southern Railway Company seventeen years ago. I feel most a sobering sense of a heavy responsibility, but I do not fear the event. I have served under two great men, Samuel Spencer and William Wilson Finley, both men of action, eager to accomplish, conscious always of the imperious summons of to-day, and of the warning of Ecclesiastes: "Whatsoever thy hand findeth to do, do it with thy might." I have known that before all they were patriotic men, faithful to the South, and with their example and their ideals before me my hope now is so to carry on their work as to gain the kind of public esteem they earned and to aid in building for the future, as they built, not only the Southern Railway but the South itself. In this high endeavor I am one of you, my fellow countrymen, who are similarly engaged, and I appeal to you as co-workers for aid and co-operation.

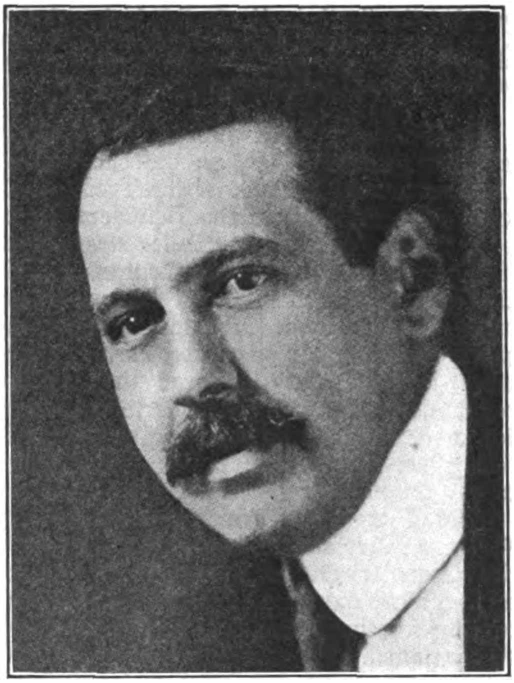
On February 17th, Judge Prouty made another public address on the occasion of the first annual banquet of the Traffic Club of Baltimore, held in the Belvidere Hotel of that city. He laid particular stress upon the imminent danger of bankrutpcy for all the railroads of the United States, unless means were provided for giving the companies more money or greater earning powers. Judge Prouty declared that as the public compelled the railroads to pay more for modern facilities and to give more efficient service, so the public would have to pay the bills.

J. M. Fitzgerald, former president of the Western Maryland Railroad, also addressed the banqueters and among other things stated that more money would have to be forthcoming for the railroads if progress was to be continued. He said in part:

> It is becoming rather difficult to say anything new about the railroad situation in this country. Since their officers began to discuss the affairs of the railways in public a great many of them have been talking a great deal with very good result. The public in general is coming to understand railway problems and the railway men themselves are coming to understand them better than they did before. The public has learned a good deal and the officers of the railways are learning a good deal. I believe that the railway officers are coming to feel that the people of this country are inclined to give the railways a square deal. It is



J. F. HOLDEN.
Vice-President, Kansas City Southern Ry.



J. M. FITZGERALD.
Former President, Western Maryland Railway.

evident that the marauders, grafters and tricksters are being eliminated from the railway world, and, on the other hand, there is some indication that the people are beginning to recognize the falsity of many of the statements recklessly made by politicians who seek to curry popular favor by denouncing the railways.

If this is the situation it augurs well for the coming era of peace and good will. The railways are here and the public is here. We have to get along together. Because of the discussion of recent years we are getting along better together and as all people come to understand all aspects of what is called the transportation problem we will get along still better together.

We are all servants of the public and the public is ourselves. The railways have nearly 2,000,000 employes, and from the presidents to the trackmen they are just as much part of the public as are the farmers, the miners and those who work in the mills and factories, shops and stores. We are working for one another and with one another. Therefore it is not exactly a matter of master and servant, in the sense that there could not be industry and commerce as we now know it without the co-operation of all of those engaged.

I think you will agree with me that the railways are performing a greater amount of service in proportion to their resources than either the agricultural or manufacturing industries and are receiving a lower proportionate return for that service. It goes without saying that this condition cannot continue. If this country is to receive the railway service which it needs, the railways must be allowed the means which will enable them to perform that service. This statement holds good with the railways under the present regime of corporate ownership and administration. It will hold good even if at some future time the proprietary interest and the administration of the railways be taken over by the Government.

CONGRESS FAILS TO COMPENSATE RAILROADS FOR PARCEL POST

Congress has again failed to do justice to the railways by passing the bill providing for the expenditures of the Postoffice Department for the next fiscal year without making any provision to compensate the railroads for carrying the parcels post. This, in spite of the fact that the bill is based upon estimates of the Postoffice Department that next year the parcels post will handle 600,000,000 packages yielding a revenue to the postoffice of $60,000,000.

In commenting upon this recent act of Congress, Ralph Peters, president of the Long Island Railroad Company and chairman of the Committee on Railway Mail Pay, has authorized the following statement:

The Postmaster General in his annual report of December 1, 1913, stated that in view of the prospective "prodigious growth" of the parcel post, "the railroads, of course, will become entitled to additional compensation for this extra service imposed upon them, and the Department is engaged in gathering all statistical data necessary for ascertaining a correct basis for fixing a just, fair, and adequate compensation for the service rendered."

On February 17th, the Railroads' Committee was advised by the Post Office Department that it had made a recommendation of Congress that "on account of the increased weight of mails" due to the parcel post, the Postmaster General should be authorized to add to the compensation of the railroads not more than one-half of one per cent.

This recommendation would have added only $254,000 to the mail pay of all the railroads in the United States.

Congress took no action on the recommendation evidently considering the proposal too trivial for consideration, and preferring to await the recommendation of the Joint Congressional Committee now investigating the whole subject.

In Great Britain the railways receive 55 per cent of the revenues from the parcel post. Before the establishment of the parcel post the railroads in this country received for transporting the mails at least one-fifth of the Post Office revenue. Assuming that their service is no greater in handling the parcel post than with other mail, this increased revenue of $60,000,000 to the Post Office Department should in all fairness mean increased payments to the railroads of at least $12,000,000.

Nevertheless, the appropriation bill passed by Congress provides no payment to the railroads beyond the provision already made that five per cent might be added to the pay of the railroads on which there had not been a weighing since January 1st, 1913.

At a time when the Interstate Commerce Commission is insisting that the railroads shall make a fair charge for every service rendered, it seems in the highest degree unjust that no provision should be made adequately to compensate the railroads for providing and operating the transportation machinery without which the mail service would be practically impossible.

THE GOVERNMENT'S RAILWAY VENTURE IN ALASKA

The Government, as represented by the National Congress, has at last definitely determined to begin railway construction on an extensive scale in Alaska. This is guaranteed by bills recently passed in both Houses in which provision has been made for the construction of a Government railroad or railroads in this territory at an authorized cost of $40,000,000, to be raised by an issue of three per cent, thirty-year bonds. In commenting on this proposed venture on the part of the Government, the St. Louis *Globe-Democrat* of February 24th, has the following to say, editorially:

"We are now on the eve of Government ownership of railways, or, at least, of one railway, which, when completed, will be a very great one. As contemplated, it is to be 1,000 miles in length, terminating at one, or perhaps two, of the Alaskan seaports, and penetrating into the interior of that vast country in directions to reach coal and other mineral deposits, timber, and other known and as yet unknown resources of that wonderful land. The original proposition was for issuing $40,000,000 in Government bonds, but both Houses of Congress have passed a bill appropriating between $35,000,000 and $40,000,000, to be paid from time to time out of current Government revenues. The bills differ in some other respects, but as they are identical in this one it will doubtless remain in the bill to be reported by the conference committee, will pass both Houses, and be signed by the President.

"The estimate of $35,000 a mile probably includes mileage only. The cost of equipment will be in addition. The heavy cost of constructing the line is due not only to engineering difficulties, but to the long distances it will be necessary to transport materials. Even should work be soon commenced, and prosecuted steadily during the part of each year when it can be done, it must be some years before the line will be complete. There are likely to be stoppages, for financial or other reasons. But the beginning of work, and the extension of the line 100 miles or more from tide water, will mark the beginning of an increase in population and the founding of new towns and the development of new industries."

THE GRADE CROSSING PROBLEM

There are many outside of railway circles who believe the carriers have not been dealt with fairly in connection with the elimination of grade crossings. In some instances, legislatures have passed laws, which has placed the entire cost of grade abolition upon the railways and, if literally interpreted, would practically bankrupt certain lines within a short period. No one is more anxious for the removal of such crossings than are the carriers. They are a continuous menace to human life and a drain upon resources, in that heavy damages are being constantly paid, owing to numerous accidents which occur at such places. It would be utterly unfair, however, for any State to assume an arbitrary attitude with regard to the immediate removal of such crossings or to insist that the entire cost should be met by the railways. In its issue of February 26th, the Philadelphia *Press* comments editorially on this problem, and its proper solution, in the following manner:

"The creation of grade crossings was probably inevitable and necessary in the early days of railroading. Their removal has now become a public question in most of the older States. Some of the railroads are eliminating the worst of them as rapidly as possible, a wise policy which the chief engineer of the Baltimore and Ohio Railroad urges all companies to adopt in order to 'halt the sentiment which is sweeping over the country for the elimination of grade crossings without proper thought of the great economic questions involved.'

"When legislatures take up the question they usually want to enforce an immediate and wholesale abolition of grade crossings, which would nearly bankrupt the railroads if insisted upon. Chief Engineer Stuart estimates that the sum of $350,000,000 would be necessary to remove all the grade crossings on the Baltimore and Ohio system, which is about half the capitalization of that company. The Pennsylvania Railroad Company recently published a statement that to eliminate all its grade crossings would cost it $600,000,000.

"It would of course be impracticable and unjust to insist on wholesale and immediate removals of grade crossings at such a cost to the railroads. The public treasury will have to share the expense of this public improvement, and it must be done gradually A settled railroad policy, as Chief Engineer Stuart recommends, of removing the worst crossings, those on the more important streets and roads where human life is always in peril because of the crossings, would so far meet the public craving for grade crossing removal that unreasonable demands for the total and immediate disappearance would probably not be insisted upon and if made would come with greatly diminished force.

"In this State the removal or regulation grade crossings is a matter left to the discretion of the new Public Utilities Commission. That is a new departure in this State, and a recognition of the fact that the grade crossings should go, but that their removal should be determined upon in a judicial spirit, with regard to the rights both of the railroads and the public. Improved roads, the automoible and electric cars on the highway have made the long-tolerated grade crossing impossible. The demand for their removal is as wide as the country. Their gradual abolition in a manner equitable to both the railroad and the public would be immensely promoted by the general acceptance by the railroads of Chief Engineer Stuart's advice, that the railroads voluntarily do even more than is required in the removal and safeguarding of grade crossings."

RAILROAD VALUATION

Commissioner Prouty's speech on Railroad Valuation before the annual meeting of the Chamber of Commerce of the United States, held in Washington during the early part of February, was received with great interest by the entire country, as it constituted the first official and comprehensive statement regarding the enormous task which the Government proposes to prosecute to a successful conclusion. Commenting editorially upon this address the *Financial America* of February 14th, has the following to say:

"Mr. Prouty, of the Interstate Commerce Commission, in his address last night at the second annual meeting of the Chamber of Commerce of the United States of America, presented the most comprehensive, public exposition of the work of railroad valuation yet made. His speech is a timely and important addition to the factors which to-day are clarifying the relations between the public and the rail carriers.

"In his discussion of the probable benefits of the work of appraisal, Commissioner Prouty takes a broad view which to us seems thoroughly justified. By his references to the benefit to accrue to the investor as 'incidental' he means, of course, the 'indirect' benefit, which often is as important as the direct.

"In railway investment the public has an immediate interest. Just in proportion as railway securities commend themselves to the investing public it is possible for the railways to obtain the money with which to make necessary improvements to their properties. Whatever benefits the credit of our railways; whatever gives to railway securities the investment quality with bank stocks and municipal bonds; whatever, in a word, takes from railroad stocks the speculative and uncertain element, indirectly reduces the cost of furnishing railway service and thereby inures to the benefit of the general public.

"Commissioner Prouty is right, therefore, in characterizing the greatest immediate value of the work as political. The state of the public mind towards our railways is such that specific information is absolutely necessary."

A TRIBUTE TO AMERICAN RAILWAY OFFICIALS

The recent appointment of Superintendent Henry W. Thornton of the Long Island Railroad to the general managership of the Great Eastern Railway of England, constitutes a high compliment to the efficiency and trustworthiness of American railway officials. Lord Claude Hamilton, chairman of the company, is quoted as saying that the dearth of proficient men in the British railway world made the choice of an American necessary to accomplish the work to be done. Mr. Thornton, who is only forty-two years old, is a graduate of the engineering department of the University of Pennsylvania and began at the foot of the ladder in the engineering service of the Pennsylvania Railroad, advancing step by step until he became superintendent of the Long Island.

Discussing the reasons given by the Chairman of the English company's Board of Directors, in which he admits that there are features connected with the British system which dulls the mental activity of employes, the Chicago *Record-Herald* says:

"As the system is one which sacrifices promotion on merit to promotion by seniority, working automatically, the result is readily explicable. However, the English newspapers criticise the admission of the directors that no sufficient effort had been made to keep in touch with the operating talent of the railroad.

"It is evident that what is called 'working up' has become, in actual practice, but a sort of 'shaking down.' And if, in addition to following a system so deadening to enthusiasm and initiative and so discouraging to ability, no effort is made to discover what ability may exist, the reason—and necessity—for importing outside talent becomes evident.

"The obvious remedy is pointed out by the London *Daily Mail,* which declares that, under a better system, Englishmen in other parts of the world have made good records. As the 'remedy' is one of wide application to many businesses, it may be quoted: 'To watch and bring forward able young men and make an end of the system that * * destroys initiative and the sense of responsibility and converts latent ability into an indifferent machine.' The results of an experiment with the product of a system that keeps such cardinal points in view will be watched with interest in both countries."

Contemporary Opinion

The Rehabilitation of the Missouri Pacific.

ONE of the most remarkable instances of recent years of the stimulating effect of great leadership is evidenced in the improvement which has occurred in the Missouri Pacific under the wise guidance of Benjamin F. Bush. The following editorial from the "Baltimore Sun" of February 1st, pays a glowing tribute to President Bush of which he may be justly proud:

"Three years ago the Missouri Pacific was the joke among Western railroads—its roadbed, rolling stock and train service regarded as about the worst in ten States. Financially and physically, it was almost a wreck, so much so that Governor Stubbs, of Kansas, threatened to secure an injunction prohibiting the operation of trains until the line was made safer for travelers. A complete change in management was imperative and while they were about it the owners searched the country for the best man available. They found him in Benjamin F. Bush, then president of the Western Maryland. How completely Mr. Bush has 'made good' is set forth in the current circular of Hambleton & Co., which presents a full and most interesting report of how the 7,000 miles of track have been 'lifted out of the mud,' a splendid train service put into effect and the line placed on a solid financial basis.

"Hambleton & Co. rightly consider this a remarkable achievement, and it is a fine example of what the new type of railroad executive can accomplish."

Irrelevant Testimony Consumes Time at Rate Advance Hearing.

CONSIDERABLE time has been consumed at the hearings before the Interstate Commerce Commission in connection with the proposed advance of five per cent in the freight rates of Eastern carriers, by the testimony of certain shippers who have evidently employed the occasion to bring to the attention of the Commission, what they considered inequalities in local rate conditions. In other words, individual rates have been complained of on account of their alleged competitive unfairness in spite of the fact that they have had nothing to do with the case under discussion. Attention is called to this by an editorial which appeared in the Pittsburgh "Dispatch" on February 4th, which states in part:

"The testimony of a Pittsburgher before the Interstate Commerce Commission, charging that rates made from the Greensburg district on coal shipped east is lower than on coal from the Pittsburgh district shipped the same direction and, therefore, an unjust discrimination, is pertinent for a hearing before the Commission providing the claim is well founded. But there is difficulty in seeing its relevance to the matter that was under consideration, namely, the application of the railroads for a five per cent increase in rates.

"The machinery of the law to prevent unjust advantages in rates between rival shippers is ample and undisputed, though it might be wished that it would show more promptitude in action. But to decide such an issue is a radically different issue from the question whether the regular rates are profitable or not."

Gratuitous Railway Service.

OWING to a statement made by Commissioner Harlan at the reopening of the Eastern rate case a few days ago, a lively discussion has occurred in the public press relative to the various allowances which are still being permitted certain industrial concerns for services performed but which really are a part of the function of transportation and as such should in some manner be provided for by the railroads. Commissioner Harlan also called attention to "other extensive services rendered by carriers without charge in addition to the rate which involved a further loss of the revenue to which the railroads are entitled." In commenting on this situation, the New York "Commercial" of February 5th, has the following to say:

"That question of gratuitous service by railroads to large shippers who have tracks and sidings of their own for the delivery of goods to main lines has been brought up again by Commissioner Harlan in the hearing on the application for an advance in rates, and has been extended to various other allowances which discriminate against the smaller shippers. After repeating what was said the other day about the operation of these spur tracks for industrial plants free of charge, or making a rebate for their use, at an estimated loss of not less than $15,000,000 a year in the Official Classification Territory, the Commissioner referred to 'other extensive services,' 'rendered by carriers without charge in addition to the rate,' involving further loss of the revenue to which the railroads are entitled. Among these is that of the 'so-called trap or ferry car' service, by means of which carriers collect and deliver traffic for large shippers at their own premises, saving to them the expense of cartage. Similar services by lighterage, drayage and by elevation is mentioned for which no direct charge is made.

"All these free services, in so far as they are for some shippers and not for others, unquestionably involve an unjust discrimination. This is all the worse in that it is done for large shippers and not for small ones. It may be said that the railroads can afford it on account of the large amount of traffic supplied by those for whom it is done, but in a quasi public service like that of railroad transportation, it is the very purpose of the law to prevent giving any such advantage to large shippers over small. So far as work is done without charge which shippers would otherwise have to do at their own expense, it is an obvious discrimination in service rendered, and it is in effect a rebate or a reduction of the rate for transportation. It is an evasion of the law which is no more to be justified than a direct violation.

"This is a lingering abuse quite apart from the rate question, and it should be corrected. It undoubtedly does in some cases detract from the revenues which the railroads ought to derive from their traffic without an advance in rates; but how much it is difficult to estimate. It may be ascertained with reference to particular lines or shipping places by close inquiry, and railroad managers would do well to facilitate the inquiry and furnish all the information they can. It is no advantage to them to perform this gratuitous service if the practice can be abandoned by all lines and for all shippers alike. It is for them to obtain all the revenue to which they are entitled for their service. It is a factor in determining the rates to be charged over their lines, and they should meet the Commission half way in determining how far it affects the need of an advance in rates."

Meeting of the Kansas City Traffic Club.

THE members of the traffic club of Kansas City were addressed on February 18th, by B. H. Meyer, of the Interstate Commerce Commission who is reported as advocating that the Commission be given the power to prescribe minimum rates, but as opposing the idea that that body should be required to approve railway securities. He said in part:

"Not the bond and stock issues of the railways, but their actual value is the proper measure of rates. The government should in some way furnish, for the benefit of investors, all the facts connected with such enterprise, but it should not compel the Interstate Commerce Commission to pass upon bonds and stocks. The facts concerning the bonds and stocks outstanding should be sufficient protection to investors.

"On the other hand, investors are likely to be misled should the Commission be forced to give its approval to stocks and bonds. This approval might be—and I know that it would be—construed as a government guaranty of the issue in question.

"I know of several instances in which the permit to issue stock given by the Wisconsin Public Utilities Commission was used almost as a State guaranty in the sale of stocks, and that without any misrepresentation, so far as I could discover.

"I object also to the plan to make the Commission fix the sales price of stocks. Supposing the price is 120 to-day and 150 to-morrow. The price might be just and legitimate, but what would the man who has to pay 150 say to the commission? I think that to regulate the sales of stocks and bonds in such fashion is approaching the problem from the wrong angle.

"I believe, however, that the public is entitled to a certain protection in its investments. It would be well to furnish it accurate information as to the amount of indebtedness outstanding against any concern which seeks to increase its capital. With such information the investor would know what he was doing, or should know.

"I believe also that no railway should be built and its stocks sold until there is a public necessity for it—until there is some one for it to serve and some prospects for its doing a profitable business. It would be proper for the Commission to have power to pass upon this phase of the matter and to require the Commission's permit before a railway is built or its stock sold.

"The Commission should have power to fix minimum transportation rates. Suppose boats were plying your river in such numbers as to create competition with the railways and the railways lowered their rates to drive the boats off the river. If the government forced the railways to continue to carry merchandise at the low rates and lose money, it would be an undesirable condition which nobody would care to see continued. On the other hand the boats would be gone. If they returned you would have the same condition to face. The Commission should have the power to fix a reasonable mimimum rate below which carriers would not be permitted to transport goods. Then the boats and the railways could go out and compete for business, offering service as an inducement."

Personal

Joseph Wood.

JOSEPH WOOD, who on February first, resigned his position as first vice-president of the Pennsylvania Lines, had been in the railway service fifty years, serving in each of the various departments. For the past five years he has been considering retiring from the active duties of railway management. Recently he suffered a great bereavement in the loss of his wife, who died suddenly, so that he felt it imperative that he give up his weighty responsibilities.

Mr. Wood will continue to serve as a director of the Pennsylvania Railroad Company, so that his associates will still enjoy the benefit of his counsel and ripe experience.

Mr. Wood was born at Haddonfield, N. J., on June 5, 1846. He was graduated as civil engineer from the Pennsylvania Polytechnic College in 1864, and entered the railway service in the autumn of the same year. Mr. Wood's first employment was as rodman on the construction corps building the Connecting Railway at Philadelphia. From 1867 to 1869 he was assistant engineer in the same service. In 1869 he became resident engineer of the Northern Central Railway.

Mr. Wood was appointed resident engineer of the Baltimore and Potomac Railroad, and engineer of the Northern Central Railway in May, 1872. In May, 1878, he was made assistant to the superintendent of motive power of the Pennsylvania Railroad at Altoona, Pa. In November, 1881, he became superintendent of motive power, and on November 1, 1887, he was appointed general superintendent of transportation of the Pennsylvania Company; the Pittsburgh, Cincinnati and St. Louis, and the Chicago, St. Louis and Pittsburgh Railroad companies. He was made general manager of the Lines West of Pittsburgh on March 1, 1890.

Mr. Wood was appointed fourth vice-president of the Lines West on January 15, 1896. On September 21, 1897, he became third vice-president, and on January 1, 1902, second vice-president. He succeeded Mr. James McCrea, on January 14, 1907, as first vice-president of the Lines West of Pittsburgh, and as president of the Vandalia and Grand Rapids and Indiana Railway companies.

James Jewett Turner.

JAMES JEWETT TURNER, who has been appointed first vice-president of the Pennsylvania Lines West, was born April 7, 1853, at Baltimore, Md. After leaving school he entered the service of the Pittsburgh, Cincinnati and St. Louis Railway, at Steubenville, Ohio, as ticket sorter, which position he occupied from February 15 to April 4, 1870. On the latter date he became connected with the Columbus, Chicago and Indiana Central Railway, working for the road at Richmond, Ind., as telegraph operator, train dispatcher and chief clerk to the superintendent.

On May 1, 1880, Mr. Turner was made superintendent of the Indianapolis and Vincennes Railroad, at Indianapolis, Ind., which position he occupied until October 10, 1885, when he became superintendent of the Eastern division of the Chicago, St. Louis and Pittsburgh Railroad, at Richmond, Ind. He held that post until April, 1888, leaving it to take over the superintendency of the Pittsburgh, Cincinnati and St. Louis Railway and its successor, the Pittsburgh, Cincinnati, Chicago and St. Louis Railway, at Pittsburgh, Pa. This position he held until January 15, 1896, when he was appointed vice-president and general manager of the Terre Haute and Indianapolis Railroad, Vandalia Line, with headquarters at St. Louis, Mo., where he remained until his election as fourth vice-president of the Pennsylvania Lines West of Pittsburgh, on June 7, 1901.

Six months later he was elected third vice-president, and on January 9, 1907, second vice-president. On February 1, 1914, Mr. Turner was elected first vice-president of the Pennsylvania Company and president of the Vandalia Railroad. Mr. Turner is an official of a number of the railroad companies affiliated with the Pennsylvania Lines West of Pittsburgh.

Edward Ballinger Taylor.

EDWARD B. TAYLOR, who has been appointed second vice-president of the Pennsylvania Lines West, was born on February 6, 1850, near Riverton, N. J. He was prepar-

JAMES J. TURNER.

EDWARD B. TAYLOR.

DANIEL T. MCCABE.

ed for college at the Westtown Boarding School, entered the sophomore class at Haverford College in 1866, graduating in 1869, and then entered the Polytechnic College of the State of Pennsylvania, where he was graduated with the degree of B. C. E., in 1870, receiving the Master's degree in 1873.

Immediately after finishing his course, he entered the service of the Pennsylvania Railroad, on July 25th, as clerk in the office of the superintendent of the Middle Division at Harrisburg, Pa. He became supervisor of Division No. 5 in September, 1871, and on March 1, 1872, he was appointed assistant engineer of the Middle Division, continuing in that office until January 1, 1875, when he was transferred to a similar position on the Pittsburgh Division.

On July 24, 1876, Mr. Taylor was made superintendent of the Lewistown Division, with headquarters at Lewistown, Pa., and remained there until January 1, 1879, when he was transferred to the superintendency of the West Penn Division. On September 1st he was transferred to the Lines West of Pittsburgh and made superintendent of the Pittsburgh, Cincinnati and St. Louis Railway. On April 1, 1888, he was promoted to the position of general superintendent of the Northwest System, becoming general superintendent of transportation of all lines West of Pittsburgh on March 1, 1890. He was elected a director and also fourth vice-president of the Pennsylvania Company and of the Pittsburgh, Cincinnati, Chicago and St. Louis Railway Company, on December 27, 1901, and third vice-president on January 9, 1907. On February 1, 1914, Mr. Taylor was elected second vice-president of the Pennsylvania Company and first vice-president of the Vandalia Railroad.

Mr. Taylor is also a director and president or vice-president of a large number of corporations forming or affiliated with the Pennsylvania Lines West of Pittsburgh. He is also connected with several financial institutions and is an active member of a number of engineering and scientific societies.

Daniel Trigg McCabe.

DANIEL T. McCABE, who has been appointed third vice-president of Pennsylvania Lines West, was born at Abington, Va., on November 25, 1849. He entered the railway service of the Pennsylvania Lines as clerk in the auditor's office of the Pittsburgh, Cincinnati and St. Louis Railway, in July, 1870.

In November, 1870, Mr. McCabe was promoted to claim clerk in the general freight office. In 1872 he became chief clerk of that office; from April, 1876, to April, 1883, he was division freight agent, in charge of the Second and Third divisions of the Columbus, Chicago and Indiana Railway, operated by the Pittsburgh, Cincinnati and St. Louis Railway, and from April, 1883, to April, 1884, he was general freight agent of the Chicago, St. Louis and Pittsburgh Railroad. Mr. McCabe served from April, 1884, to July, 1886, as general Western freight agent and division freight agent of the Second, Third and Fourth divisions of the same road, and from July, 1886, to October, 1890, he was assistant general freight agent of the Pittsburgh, Cincinnati and St. Louis Railway and Chicago, St. Louis and Pittsburgh Railroad. From October, 1890, to August, 1892, he was assistant general freight agent of The Pittsburgh, Cincinnati, Chicago and St. Louis Railway, and from August, 1892, to April 1, 1897, general freight agent.

On April 1, 1897, Mr. McCabe was made freight traffic manager of the Pennsylvania Lines West of Pittsburgh.

On January 9, 1907, Mr. McCabe was elected fourth vice-president of the Pennsylvania Lines West of Pittsburgh, and on January 14, 1907, he was elected vice-president of the Vandalia Railroad Company, in charge of the traffic department. Effective February 1, 1914, he was elected third vice-president of the Pennsylvania Lines West of Pittsburgh, and vice-president of the Vandalia Railroad Company, in charge of the traffic department.

George L. Peck.

GEORGE L. PECK, who has been appointed fourth vice-president of Pennsylvania Lines West, was born July 10, 1858, at Sandusky, Ohio. His railroad service began in 1873 as messenger boy on the Toledo division of the Pennsylvania Company. Mr. Peck's first promotion was to the position of telegraph operator, which he held from 1874 to 1876. From the latter date to 1881 he was train dispatcher in the service of the Pennsylvania Company. From 1881 to 1882 he held the same position on the Columbus, Hocking Valley and Toledo Railway.

In 1882 Mr. Peck was made trainmaster on the Toledo division of the Pennsylvania Company, and from 1894 to January 15, 1896, he was super-

GEORGE L. PECK.

ALFRED M. SCHOYER.

SAMUEL C. SCOTT.

intendent of the Richmond division of the Pittsburgh, Cincinnati, Chicago and St. Louis Railway. He held the position of superintendent of the Pittsburgh division of the same road from January 15, 1896, to January 1, 1901, when he was made general superintendent of the Southwest System of the Pennsylvania Lines West of Pittsburgh.

On June 7, 1901, Mr. Peck was promoted to the position of general manager of the Pennsylvania Lines West of Pittsburgh, and on January 1, 1913, he was elected fifth vice-president. He became fourth vice-president of the Pennsylvania Company and third vice-president of the Vandalia Railroad on February 1, 1914.

Mr. Peck is a member of the executive committee of the American Railway Association.

Alfred McGill Schoyer.

ALFRED M. SCHOYER, who has been appointed resident vice-president at Chicago of the Pennsylvania Lines West, was born in Allegheny, Pa., November 7, 1859. He is a descendant of two of Pittsburgh's oldest families, the Schoyers and the McGills, who emigrated to Pittsburgh late in the eighteenth century.

Mr. Schoyer was educated in private schools, and entered the railroad service as messenger, in the office of the Pennsylvania Company at Pittsburgh, May 1, 1872. From that date he filled the position of telegraph operator, train dispatcher, chief train dispatcher and division operator until January 1, 1892, when he was appointed superintendent of telegraph of the Pennsylvania Lines West of Pittsburgh. In 1903 his jurisdiction was extended over the Vandalia Railroad.

On November 1, 1889, Mr. Schoyer was appointed superintendent of the Eastern division of the Pennsylvania Company, and on January 1, 1902, he was made general superintendent of the Northwest System. On January 1, 1913, he was appointed general manager of the Vandalia Railroad, and on February 1, 1914, he was elected resident vice-president of the Pennsylvania Lines, with offices at Chicago.

Mr. Schoyer is a member of the Duquesne Club of Pittsburgh, the Union League Club of Chicago, and the St. Louis Club and Noonday West of Pittsburgh. In 1903 his juirisdiction was treasurer of the Chautauqua Institution, of Chautauqua, N. Y.

Samuel Church Scott.

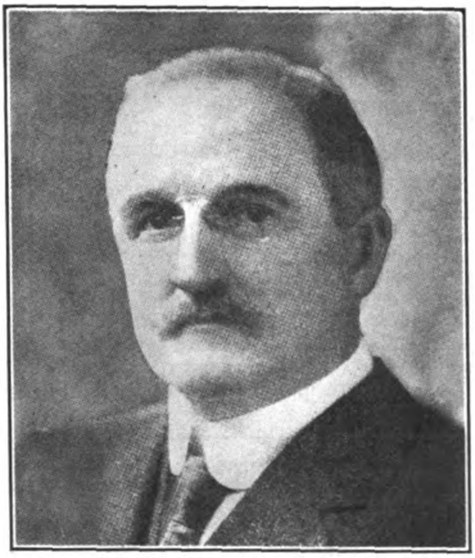
SAMUEL CHURCH SCOTT, who has been appointed vice-president's assistant of the Pennsylvania Lines West, was born on April 4, 1854, at Toledo, Ohio, and after leaving school entered the service of the Pittsburgh and Connellsville Railroad, in 1872. Two years later he became connected with the Pennsylvania Railroad, leaving the service in 1875. In the fall of 1876 he matriculated at the Homœopathic Medical College, Philadelphia, graduating in 1878. After practicing medicine four years, Mr. Scott again entered railroad service in September, 1882, when he became clerk in the office of the manager of the Pittsburgh, Cincinnati and St. Louis Railroad.

On October 18, 1885, he became chief clerk to the general manager of the Pennsylvania Lines West of Pittsburgh; two years later, chief clerk to the fourth vice-president and general manager. On March 1, 1890, Mr. Scott became chief clerk to the second vice-president, and on April 23, 1891, chief clerk to the first vice-president. He served nearly eleven years in that capacity, and on January 1, 1902, was made assistant to the first vice-president of the Pennsylvania Lines West.

On January 1, 1905, Mr. Scott was made assistant to the president of the Vandalia Railroad, and on April 7th, of the same year, assistant to the president of the Grand Rapids and Indiana Railway Company. On September 10, 1906, he was elected vice-president of the Cleveland, Akron and Columbus Railway Company, now the Cleveland, Akron and Cincinnati Railway Company. On February 1, 1914, he was appointed vice-president's assistant.

William R. Scott.

WILLIAM R. SCOTT, who on February 1st, became vice-president of the Pacific System of the Southern Pacific Company with headquarters at San Francisco, Cal., was born in 1860. He was educated in the public schools and entered railway service in 1881, since which time he has been consecutively to July 12, 1884, locomotive fireman, Atchison, Topeka & Santa Fe Railway; July 12, 1884 to July 1, 1891, locomotive engineer; July 1, 1891 to August 15, 1898, traveling engineer, same road; August 15, 1898 to June 1, 1900, trainmaster, Northern Division, Gulf, Colorado & Santa Fe Railway; June 1, 1900 to March 1, 1901, division superintendent, same road at Cleburne, Texas; March 1, 1901 to July, 1903, general superintendent, Fort Worth & Denver City Railway; September to November, 1903, assistant superintendent, Sacramento division, Southern Pacific Company; November, 1903 to June 1, 1905, superintendent, Salt Lake Division, same company; June 1, 1905 to September, 1, 1907, superintendent, Western Division, same company; September 1, 1907, to November 1, 1907, general superintendent; November 1, 1907 to July 15, 1912, assistant general manager; July 15, 1912 to February 1, 1914, general manager.



E. E. Calvin.

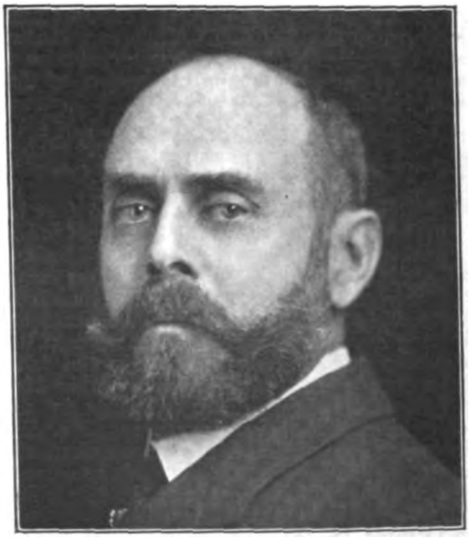
E. E. CALVIN, vice-president of the Southern Pacific Company at San Francisco, Cal., has been appointed vice-president and general manager of the Oregon Short Line Railroad, with office at Salt Lake City, Utah, effective February 1, 1914. He succeeds W. H. Bancroft, whose resignation was announced recently. Mr. Calvin was born October 16, 1858, in Indianapolis, Ind. He began his railroad career in 1873 and for two years was telegraph operator for the Indianapolis, Cincinnati and Lafayette Railway. He then went back to school for a year. From April, 1877, to March, 1882, he was telegraph operator and station agent for the Union Pacific Railroad. From then until June 1, 1887, he held the positions of train dispatcher, conductor and trainmaster. June 1, 1887, he was made division superintendent of the Missouri Pacific Railway. On February 22, 1891, he accepted service with the Oregon Short Line Railroad, as superintendent of the Idaho division, remaining in that capacity until 1895. He then became general superintendent of the International and Great Northern Railway, with headquarters at Tyler, Tex., but in March, 1897, he returned to the Oregon Short Line as general superintendent, with headquarters at Salt Lake City, Utah. From May 15, 1903, until April 1, 1904, he was assistant general manager of the Oregon Short Line. Mr. Calvin went to Portland in 1904 to take charge of the Oregon-Washington Railroad and Navigation Company, as vice-president and general manager of the road. Until July 15, 1912, he was general manager of the Southern Pacific Company with headquarters in San Francisco. He was then made vice-president in general charge of construction and operation, the position he left February 1 to accept the general managership of the Oregon Short Line.

A. B. Newell.

A. B. NEWELL who has been elected president of the Toledo Terminal Railroad Company, entered railway service with the Lake Shore and Michigan Southern Railway in July, 1890. In November, 1891, he was appointed superintendent of the Kalamazoo division of this road. In May, 1892, superintendent of the Jamestown-Franklin division and in February, 1893, superintendent of the Western division. In 1901 he became president and general manager of the White Pass and Yukon road, and in 1906, left the railway service to engage in the railway business. In 1908, he became superintendent of the Mexican Central Railroad and in 1909, president of the Tennessee Central Railroad, which position he held at the time of his election.

Charles S. Churchill.

CHARLES S. CHURCHILL, who on March first, was appointed assistant to the president of the Norfolk and Western Railway Company, began his railway career in 1879 as a supervisor in railway construction working in Connecticut and Pennsylvania, in the latter State assisting in the construction of what is now a portion of the Bessemer and Lake Erie Railroad. In 1881, he became division engineer of construction of the Pittsburgh and Lake Erie Railroad, and in 1884 was appointed principal assistant engineer of the Schuylkill division of the Pennsylvania Railroad. In 1887 he accepted a position as engineer of maintenance of way of the Shenandoah Valley Railroad and in 1888 was appointed to a similar position on the Norfolk and Western. In 1903, he became chief engineer of the Norfolk and Western, which position he held until his recent appointment. Mr. Churchill has also filled terms as vice-president and director of the American Society of Civil Engineers. He is a member of the Institution of Civil Engineers and of the Advisory Committee of the American Association for Testing Materials. Last March he completed a term as president of the American Railway Engineering Association.



CHARLES S. CHURCHILL.

P. M. Ripley.

P. M. RIPLEY, who has recently been appointed assistant to the president of the El Paso and Southwestern System, entered railway service as axeman for the Illinois Central at Chicago in 1902. Since then he has been consecutively employed as chainman, draughtsman and instrumentman for the Chicago and Alton and the Atchison, Topeka and Santa Fe. In 1904, he became clerk in the local freight office of the Atchison, Topeka and Santa Fe at Chicago, and in 1906 filled successively the positions of clerk in the statistician's office, tariff clerk and rate clerk in the general freight office of the same road. In 1908, he became traffic manager for Phelps, Dodge and Company, of New York, and in 1902 accepted the position of assistant general traffic manager of the El Paso and Southwestern Company. In November, 1912, he became chief clerk to the vice-president in charge of all departments, which position he held until his recent appointment.

J. H. White.

J. H. WHITE, who has been appointed assistant to the president of the Chicago, Indianapolis and Louisville Railway, graduated from Harvard University in 1906, and in July of the same year, entered the railway service as rodman in the engineering department of the Grand Trunk Pacific Railway. He served in the engineering, mechanical, transportation and purchasing departments of this road and of the Grand Trunk until September, 1908, when he accepted the position as chief clerk to the assistant to the president of the Wabash Railroad. In June, 1911, he was appointed special inspector reports to the president, and in March, 1913, became general fuel inspector of that road. He held this position until his recent appointment.

E. D. Levy.

E. D. LEVY, who, on March 1, became general manager of the St. Louis and San Francisco Railroad, was born in Paris, Texas, October 16, 1879. He first entered railway service as stenographer in office of manager of the Santa Fe Refrigerator Dispatch, Chicago, Illinois, February 1, 1898, serving as stenographer to the assistant superintendent of motive power and equipment, Michigan Central Railway, Detroit, Michigan; stenographer in the office of the general superintendent of the Chicago, Milwaukee and St. Paul Railway, Chicago, Illinois. Secretary to the industrial commissioner of the Atchison, Topeka and Santa Fe Railway, Chicago, Illinois, and entered the service of Mr. W. C. Nixon, then superintendent of the Chicago division of the Atchison, Topeka and Santa Fe Railway, Chicago, Illinois, on August 8, 1898, as Mr. Nixon's secretary, and has been with Mr. Nixon practically ever since with the exception of two periods when he left his employ for a short time. When first leaving Mr. Nixon, in March, 1899, he was stenographer in the office of the master mechanic of the Atchison, Topeka and Santa Fe Coast Lines at Needles, California. Stenographer in office of the master mechanic of the Ft. W. & D. C. Railway, Fort Worth, Texas. Stenographer in the office of the vice-president and general manager of the Mexican Central Railway, City of Mexico; re-entering Mr Nixon's service when he was general superintendent at Galveston, as Mr. Nixon's secretary, January 26, 1900, and leaving on July 1, 1900, and working as secretary to the superintendent of the Kansas City Southern Railway, Texarkana, Ark., and chief clerk to the trainmaster of the Kansas City Southern Railway, same place; re-entering Mr. Nixon's service as stenographer in his office, December 15, 1900, serving as file clerk and later as his secretary. When Mr. Nixon was promoted to general manager of the G. C. & S. F. Railway, Galveston, Texas, in February, 1902, was made transportation clerk in the office of the general manager. He was promoted to senior clerk, general manager's office, April 30, 1903, and on May 1, 1904, promoted to chief clerk to F. G. Pettibone, general superintendent, G. C. & S. F. Railway, which position he held until August 15, 1906, when he came to the St. Louis and San Francisco Railway as assistant superintendent of car

E. D. LEVY.

service. He was made superintendent of transportation on June 1, 1907, and appointed assistant general manager May 1, 19111.

Thomas Benton Hamilton.

THOMAS BENTON HAMILTON, who has been recently appointed general manager of the Vandalia Railroad, was born in 1865, and graduated from Princeton University in 1888. He entered railway service in 1888 as rodman of the Jeffersonville, Madison and Indianapolis Railway at Louisville, Ky., since which he has been consecutively, January 27, 1890, to January 1, 1896, assistant on engineers corps Pittsburgh division, Pittsburgh, Cincinnati and St. Louis Railway; January 1, 1896, to May 1, 1897, assistant engineer Pittsburgh division, Pittsburgh, Cincinnati, Chicago and St. Louis Railway; May 1, 1897, to April 1, 1898, engineer maintenance of way, Toledo division, Pennsylvania Company; April 1, 1898, to April 1 1900, engineer maintenance of way, Cincinnati division, Pittsburgh, Cincinnati, Chicago and St. Louis Railway; April 1, 1900, to June 1, 1901, engineer maintenance of way, Cleveland and Pittsburgh division, Pennsylvania Company; June 1, 1901, to December 21, 1903, superintendent, Erie and Ashtabula division, same company; December 21, 1903, to January 1, 1912, superintendent Cleveland and Pittsburgh division, same company; January 1, 1912, to date, general superintendent, Central System of the Pennsylvania Lines West of Pittsburgh, which is operated by the Pennsylvania Company.

THOMAS B. HAMILTON.

M. Riddle.

M. RIDDLE, who has been appointed general manager of the Florida East Coast Railway began his railway career with the Norfolk and Western in 1887 in the general engineering department. In 1890 he entered the service of the Atlantic Coast Line Railroad as roadmaster, was made superintendent in 1900 and assistant chief engineer in 1904. He became general superintendent in 1905 which position he held at the time he became general manager.

F. S. Wynn.

F. S. WYNN, who, on February first, was promoted to be secretary of the Southern Railway Company, with office at 30 Church street, New York, vice R. D. Lankford, deceased, was born in Danville, Va. He is thirty-four years of age. He entered the service of the Southern Railway Company in April, 1900, in the law department at Washington. Later he served as secretary and also as chief clerk to the assistant to the president and vice-president. In January, 1909, he was made assistant secretary of the company, and in August, 1910, purchasing agent.

He graduated at Georgetown University school of law in 1906.

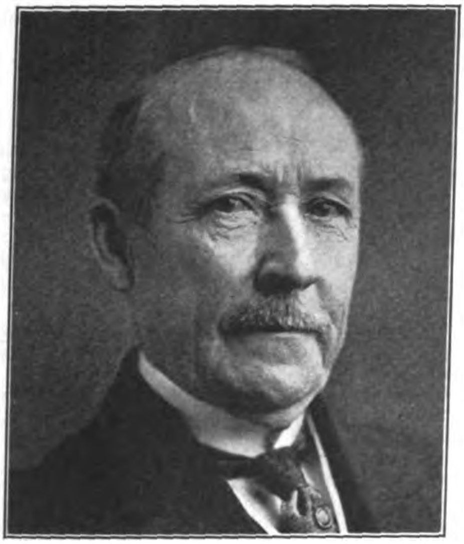
James T. Leary.

JAMES T. LEARY, until recently general auditor of the Baltimore and Ohio, has been appointed comptroller of the company to succeed the late Capt. Geo. W. Booth.

The new comptroller of the Baltimore and Ohio was born September 17, 1858, at Ithaca, N. Y. He is a graduate of Cornell University, of the Class of '80, having taken up a special course of scientific studies.

Mr. Leary first entered railway service with the Pennsylvania Company as a clerk in the mechanical department at Fort Wayne, Ind., in June, 1882. In May, 1883, he was promoted to the chief clerkship in the office of superintendent of motive power of the same company, and in November, 1899, was made chief clerk to the general superintendent motive power, of the Pennsylvania Lines West of Pittsburgh, with headquarters in that city.

He came to the Baltimore and Ohio in June, 1901, as assistant to the general manager, at Baltimore, and was advanced to general auditor in

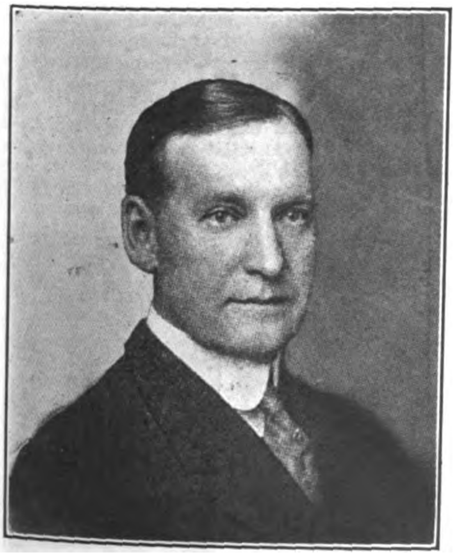


James T. Leary.

April, 1902, having held that position for the last twelve years.

Frank E. Otis.

FRANK E. OTIS, who has been appointed assistant general freight agent of the Chicago, Milwaukee and St. Paul, with headquarters at Minneapolis, Minn., was born February 2, 1869, at Beloit Wis. He graduated from high school at Hudson, Wis., in June, 1886, and began railway work March 1, 1887, with the Minnesota and Northwestern, now a part of the Chicago Great Western. In December, 1890, he became clerk to the commercial agent of the Chicago, Milwaukee and St. Paul at St. Paul, Minn., and in January, 1893, was transferred to Minneapolis, Minn. in a similar capacity. Two years later he was advanced to freight solicitor at Minneapolis and in the spring of 1897 was made chief clerk to the general Northwestern agent at that point. The following year Mr. Otis was made traveling freight agent and in September, 1900, was appointed commercial agent at Duluth, Minn. He was transferred to St. Paul in May, 1902, as commercial agent, where he remained until his recent promotion to the position of assistant general freight agent at Minneapolis, as above noted, having been in continuous service of the St. Paul for twenty-three years.



Frank E. Otis.

James P. Orr.

IN accordance with the pension rules of his company, James P. Orr, assistant freight traffic manager of the Pennsylvania Lines West, was retired on January 1st.

Mr. Orr's record with the Pennsylvania Lines was an enviable one. For eighteen years he held various clerical positions, while for more than thirty years he was an officer of the company.

James P. Orr.

In commenting on Mr. Orr's work as an officer, one high in the councils of the railroad said:

"Up to April 1, 1883, Mr. Orr occupied various positions with the Pennsylvanai Company, being appointed division freight agent on that date. His next promotion was to the position of general freight agent on April 1, 1897, which title he held until July 1, 1908, when he was appointed assistant freight traffic manager.

"During the thirty years as an officer, he has earned for himself, among both railroad and shipping interests, a reputation of which any man might justly be proud. His opinions and views, expressed always upon conservative lines and only after careful analysis and complete consideration of all phases of a question, have been received with the respect due to a man of unwavering honesty of purpose and have been looked upon as guideposts for rate structures that will long outlive his period of service. This is particularly true as to the enormous iron and steel and allied tonnage moving in the large territory under his jurisdiction."

C. I. Leiper.

C. I. LEIPER, who has been appointed superintendent of the Philadelphia, Baltimore and Washington Railroad, with headquarters at Cape Charles, Virginia, was born in Wallingford, Pa., October 28th, 1874. He graduated from Swarthmore College in 1895, after which he took a special course at the University of Pennsylvania.

Mr. Leiper entered the service as rodman in Jersey City in 1899. He went to Altoona as transitman on February 1, 1901, and March 15th was made assistant supervisor on the Maryland division. He was promoted to supervisor on the same division in 1903. Later he served as supervisor on the Pittsburgh division and the present Manhattan division.

Mr. Leiper was made division engineer of the Manhattan division August 15, 1909, and in 1911 he went to the New York division in the same capacity. He was promoted to be principal assistant engineer at Wilmington on June 6, 1913.

J. C. Auten.

J. C. AUTEN, who has been appointed principal assistant engineer, Philadelphia, Baltimore and Washington Railroad, was born August 31, 1870, at Montandon, Pa. He was educated at the Sunbury High School.

Mr. Auten was employed by the railroad in 1893 as rodman in the assistant engineer's office on the Sunbury and Shamokin division. On May 1, 1894, he was made acting assistant supervisor on the Philadelphia and Erie Railroad, and in November of that year he was promoted to supervisor. On October 1, 1898, he was transferred to the Baltimore division of the Northern Central Railway as supervisor, and in 1901 to the Middle division. He was promoted to assistant engineer of the Elmira and Canandaigua division in 1902, and later served in the same capacity on the Western Pennsylvania division, Eastern and Susquehanna division, and the West Jersey and Seashore Railroad. He was promoted to division engineer of the Maryland division on January 15, 1910, and on February 11, 1914, was appointed principal assistant engineer of the Philadelphia, Baltimore and Washington Railroad.

Robert V. Massey.

ROBERT V. MASSEY, who has recently been appointed superintendent of the maintenance division of the Pennsylvania Railroad, was born in Dover, Kent County, Del., September 29, 1871. He prepared for college at the "Hill School," at Pottstown Pa., and was graduated from the Sheffield Scientific School of Yale University, in 1892.

Mr. Massey entered the service of The Pennsylvania Railroad Company in the construction department, September 1, 1892, and remained in that department until August, 1895, whe he was transferred to the maintenance of way department, in the office of the principal assistant engineer at Altoona. He was appointed assistant supervisor at Freeport, Pa., November 1, 1895, and on April 1, 1897, transferred to Baltimore, Md., as assistant supervisor of the Baltimore division, Northern Central Railway. He was transferred to Mifflin, Pa., as assistant supervisor, Middle division, Pennsylvania Railroad, on April 1, 1899, and, on August 1st of the following year was advanced to supervisor of the Schuylkill division. In that capacity he was transferred to the Maryland division, Philadelphia, Baltimore and Washington Railroad, April 15, 1902, and to the Pittsburgh Yard, December 15, 1902.

On April 1, 1907, Mr. Massey was promoted to division engineer of the Schuylkill division. He was transferred to the New York division on January 1, 1909, and on March 7, 1911, he was promoted to superintendent of the New York, Philadelphia and Norfolk Railroad.

Charles Shalter Krick.

CHARLES S. KRICK, who has been appointed superintendent of the Philadelphia Terminal division of the Pennsylvania Railroad, was born at Reading, Pa., March 16, 1866. He graduated at Lafayette College in June, 1887. Mr. Krick entered the service of the Pennsylvania Railroad Company on July 11, 1887, as rodman in the assistant engineer's office, Schuylkill division, and was transferred to Altoona, April 14, 1890. He was appointed assistant supervisor of the Tyrone division on December 14, 1890, assistant supervisor of the Philadelphia

C. I. LEIPER.

J. C. AUTEN.

ROBERT V. MASSEY.

CHARLES S. KRICK.

division on April 1, 1892, and on May 16, 1895, he was made acting supervisor of the Schuylkill division being appointed supervisor on June 1, 1896. He was advanced to supervisor of the Middle division on June 14, 1897, and to the Pittsburgh division in the same capacity on January 1, 1900. On January 1, 1903, he was appointed assistant engineer of the Eastern and Susquehanna divisions, and on the Philadelphia Terminal division on August 20, 1903. On January 1, 1906, he was appointed principal assistant engineer of the Philadelphia, Baltimore and Washington Railroad.

Mr. Krick was promoted to superintendent of the New York Terminal division April 1, 1907. On January 1, 1912, he was appointed superintendent of the Manhattan division.

Mr. Krick's appointment as superintendent of the Philadelphia Terminal division became effective February 11, 1914.

Frederick Grant White.

FREDERICK GRANT WHITE, who has been appointed signal engineer of the Chicago Great Western, with office at Chicago, was born February 6, 1882, at Waterloo, Wis. He studied electrical engineering at the University of Wisconsin, completing a four-year course in 1905. In July of that year he began railway work with the Pennsylvania Lines West of Pittsburgh as signal repairman at Chicago, and in August, 1906, he was transferred to the Eastern division of the Pittsburgh, Ft. Wayne and Chicago at Rochester, Pa., as signal maintainer and repairman. From April, 1907, to May, 1908, he was assistant construction foreman on the same division at Alliance Ohio, and was then draftsman in the signal engineer's office at Pittsburgh, Pa., for one year. He left the Pennsylvania Lines in May, 1909, to go to the Northern Pacific as draftsman and designer in the signal department at St. Paul, Minn., for three months. He then became signal supervisor of the Chicago Great Western at St. Paul, in March, 1910; he was appointed assistant to the special signal engineer, and in November was made assistant signal engineer, resigning in July, 1912. The following three months he was with the Canadian Pacific at Montreal, Que., as valuation signal engineer, leaving that road to become signal inspector of the Great Northern at St. Paul, from which road he now returns to the Chicago Great Western as signal engineer, as above noted.

H. Bortin.

H. BORTIN, has resigned as engineer in charge of valuation of the Union Pacific Railroad and as member of its valuation committee, to accept the position of assistant to Thomas W. Hulme, general secretary of the President's Conference Committee in the valuation of the railroads in the United States, with headquarters at Philadelphia. Mr. Bortin, prior to entering the service of the Union Pacific has worked with the Isthmian Canal Commission in Panama for two and one-half years on municipal engineering, on the hydraulics of the Canal and in connection with the excavation work at Culebra.

E. P. Weatherly.

E. P. WEATHERLY, who has been appointed engineer of maintenance of way of the Kansas City Terminal Railway Company, was born near Salisbury, Mo., in 1877. He received an A. B. degree in 1897 from the University of Missouri, and in 1899 a B. S. degree in civil engineering. Mr. Weatherly entered railway service in the latter year as rodman for the Chicago, Burlington and Quincy Railroad at Hannibal, Mo., and in 1900, he was promoted to the position of resident engineer at Brookfield, Mo., from which position he was transferred again to Hannibal, Mo., in 1901. In 1903, he was promoted to division engineer at St. Joseph, Mo., and in 1909, became engineer of construction at Marion, Ill., in charge of extension to the Ohio River. On January 1, 1911, he left the services of the Burlington to become division engineer of the Kansas City Terminal Railway at Kansas City, Mo., which position he

E. P. WEATHERLY.

held until his recent promotion. Mr. Weatherly is a member of the American Society of Civil Engineers and of the American Railway Engineering Association.

John W. Meredith.

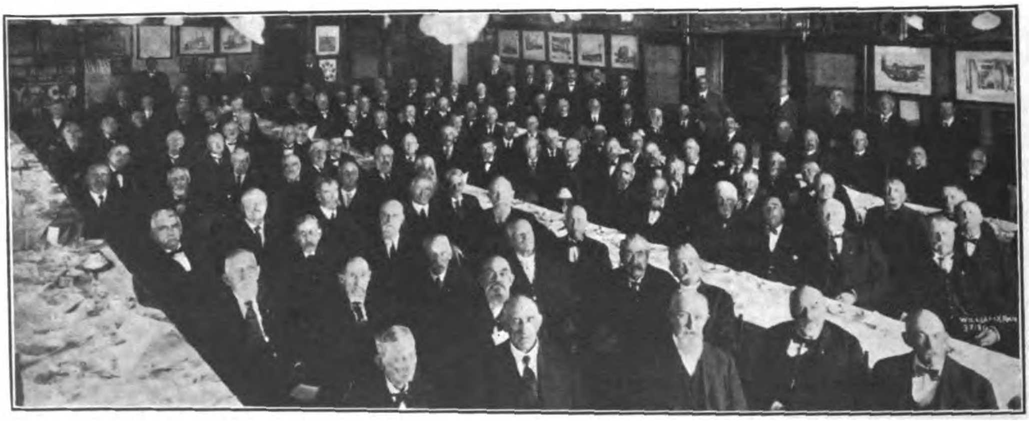
JOHN W. MEREDITH, who has been appointed general superintendent of the Central of New Jersey, with headquarters at New York, was born in March, 1862, at Maiden Creek, Pa., and was educated at the public schools and at Carroll Institute Reading. He began railway work as an extra station agent on the Philadelphia and Reading in 1885, and later in the same year entered the service of the Central of New Jersey, at Winslow Junction, N. J. He was agent at West End during the summer of 1886, becoming extra agent on the New Jersey Southern division of the same road the following winter. From 1887 to 1897, he was train despatcher at East Long Branch on the same division, and then for four years was trainmaster of that division. He was appointed superintendent in 1911, which position he held at the time of his recent appointment as general superintendent of the same road as above noted.

D. C. Rounesville.

D. C. ROUNSEVILLE, who has been appointed engineer of maintenance of the Chicago and Northwestern Lines east of the Missouri River, was born October 29, 1856, at Sheboygan, Wis. He was educated in public and private schools, and began railway work April 1, 1879, as chainman on location for the Milwaukee, Lake Shore and Western, now a part of the Chicago and North Western. The following April he went to the St. Paul and Eastern Grand Trunk as instrument man, and in September of that year returned to the Milwaukee, Lake Shore and Western as assistant engineer, which position he held until March, 1884. He was then for nine years locating and construction engineer, being promoted to division engineer in 1893. Two years later he was appointed assistant engineer of the Chicago and North Western, and in September, 1897, was made division engineer of the Ashland division, where he remained until March, 1906, when he was transferred to the Manitowoc, Green Bay and North Western as resident engineer. In April, 1907, he returned to the Ashland division as division engineer, and in March, 1909, was transferred to the Milwaukee, Sparta and North Western as resident engineer. Three years later he was made resident engineer of the St. Louis, Peoria and North Western also subsidairy to the Chicago and North Western at Pekin, Ill., from which position he is now promoted to engineer of maintenance, as above noted.

Pennsylvania Railroad Veterans.

THE following interesting photograph shows the veteran employes of the Pennsylvania Railroad being entertained at luncheon by the Pennsylvania Railroad Department of the Young Men's Christian Association on December 18, 1913. There were present 150 men whose ages ranged from sixty-five to ninety-three years. All of these men were veteran employes of the Pennsylvania Railroad Company, now retired and on the honor roll of the company. It is doubtful if 150 veterans of as fine a type and so high a character, whose life work had been performed under one employer, could be assembled elsewhere.



PENNSYLVANIA RAILROAD VETERANS AT ANNUAL BANQUET IN Y. M. C. A. QUARTERS, PHILADELPHIA. ONE HUNDRED AND FIFTY OF THESE MEN'S AGES RANGE FROM SIXTY-FIVE TO NINETY-THREE YEARS.

Obituary

E. F. Ackerman, assistant engineer of the Lehigh Valley at New York, died on December 26th at Johns Hopkins University hospital, Baltimore, Md. Mr. Ackerman entered the service of the Lehigh Valley on July 23, 1896, as a draughtsman and through steady promotion rose to be assistant engineer in June, 1902. He had charge of the construction of the Irvington branch, the preliminary service and the construction work of the Lehigh & Lake Erie Railroad, the Greenville & Hudson viaduct, the Hayes Creek, the Buck Mountain branches, the preliminary service, etc., of the Seneca Falls branch, the construction of the grain elevator at Communipaw, the Johnson Avenue yards in Jersey City and the Newark passenger station. For the past few months Mr. Ackerman has been in charge of work in connection with the company's Buffalo terminal improvements.

Joseph Boyd Baker, superintendent of the Philadelphia Terminal division of the Pennsylvania Railroad at West Philadelphia, Pa., died on February 3rd. He was born in August, 1853, and received his education at Lehigh University. He entered the service of the Pennsylvania Railroad in July, 1884, as a rodman at Altoona, Pa. He was made assistant supervisor at Lewistown in March, 1885, and held the same position subsequently on the Middle Division, the Maryland Division and the Pittsburgh Division, becoming supervisor of the Monongahela Division on March 6, 1889. He was transferred the following December as supervisor to the Philadelphia Division and in October, 1895, became assistant engineer of the Middle Division of the Philadelphia & Erie. He was transferred as assistant engineer in March, 1897, to the Pittsburgh Division, and was again transferred in the same capacity in January, 1899, to the Philadelphia Division. In February, 1902, he was appointed superintendent in charge of the Frederick Division; four months later he was made superintendent of the Cambria and Clearfield Division, and since November 1, 1902, he was superintendent of the Philadelphia Terminal Division.

William F. Berry, formerly vice-president of the Boston & Maine in charge of traffic, died on January 8th, at his home in Winchester, Mass. He was born on February 2, 1844, at Biddeford, Maine, and began railway work on May 1, 1864. He was consecutively station agent, freight and ticket clerk on the Eastern Railroad to May, 1866; then, for about six years, he was station agent. From April, 1872, to June, 1874, he was assistant general freight agent, becoming general freight agent on the latter date. On January 1, 1885, he was appointed assistant general freight agent of the Boston & Maine, the Eastern Railroad having become a part of that system. From March, 1889, to May, 1892, he was general freight and passenger agent of the Boston & Maine System, including all leased lines and branches; also general freight agent of the St. Johnsbury & Lake Champlain, and from February 1, 1892, also chairman of the executive committee of the Rome, Watertown & Ogdensburg Fast Freight Line. From May, 1892, to December, 1895, he was general traffic manager of the Boston & Maine. He was then made second vice-president, with authority over the traffic department. He was retired on June 1, 1913, after a service of almost fifty years with the Boston & Maine system.

Asa P. Blakslee, president and general manager of the Mauch Chunk Switchback Railway, died recently at his home in Mauch Chunk, Pa. Mr. Blakslee was born on November 13, 1854, at Mauch Chunk and began railway work in 1869, as telegraph messenger and ticket checker on the Lehigh Valley. From 1871 to 1873 he was waybill entry clerk, and later was made waybill examiner of the same road. He was the general freight and passenger agent of the Montrose Railway until it was absorbed by the Lehigh Valley. From February, 1878, to June, 1884, he was car accountant of the Lehigh Valley, and then became general car agent. He was in the real estate department of the same road from April, 1892, to January, 1899, and since March, 1899, had been successively superintendent, and president and general manager of the Mauch Chunk Switchback.

William Henry Boardman, for many years president of the "Railroad Gazette" (now the "Railway Age Gazette") and for eight years its editor, died at his home in Ridgefield, Conn., February 16th. He was born in Dixon, Ill., on August 3, 1846. His father owned and published the "Dixon Telegraph." It was in this office that Mr. Boardman first learned the many details of printing and publishing which stood him in good stead later. He was graduated from the University of Michigan in 1869. During the years that he was at the University he was employed during vacation times in the survey of the Great Lakes then being made by the War Department. After working for a time on his father's newspaper, Mr. Boardman was employed by the "Railroad Gazette," then published in Chicago. From that time and until early in 1911, when he became ill, Mr. Boardman gave his entire time to the affairs of what is now the Simmons-Boardman Publishing Co. At the time of the great Chicago fire, in 1871, he put the remaining assets of the "Railroad Gazette" in his bag and started for New York, where the work of publishing the paper was resumed. In 1878 he established a home in Franklin, now Nutley, N. J., and lived there for 22 years. He was active in politics, an officer in the town government, president of the school board, and an officer of several of the local social and sporting clubs. Later he moved to New York City and made his country home at Ridgefield, Conn. He was fond of outdoor sports. He was a member of the Century Club, the St. Andrew's Golf Club and the Camp Fire Club. On November 5, 1874, Mr. Boardman was married to Miss Henrietta Frances Hall, of Rutland, Vt., who survives him, as do also three sons, Francis, Dixon and Bradford, and two daughters, Mrs. Richard S. Chisholm and Miss Clara T. Boardman.

William A. Boehm, formerly traveling freight agent of the Minneapolis, St. Paul & Sault Ste. Marie Ry., at Cincinnati, Ohio, died at his home in that city, January 1st, aged 26 years.

George W. Booth, comptroller of the Baltimore & Ohio R. R., died suddenly at his home in Baltimore, Md., January 6th, aged 69 years.

Daniel Byrnes, attorney for the Minneapolis, St. Paul & Sault Ste. Marie Ry., at Chicago, died in that city January 25th, aged 50 years.

John W. Callahan, general manager of the Chicago Tunnel Company, died on February 13th at his home in Chicago, aged 51 years. Mr. Callahan formerly was trainmaster of the Belt Railway of Chicago, and subsequently was general manager of the Indiana Harbor Railroad.

George L. Carman, of Chicago, formerly superintendent of the Western Railway Weighing Association, died at Los Angeles, Cal., on February 11th. Mr. Carman was born September 7, 1838, in New York City. He entered railway service in March, 1855, and was consecutively train boy, Cleveland & Toledo; clerk in local freight office of the Mississippi & Missouri at Iowa City, Iowa; cashier in the local freight office of the Chicago, Rock Island & Pacific at Davenport, Iowa, until August, 1871, when he went to the Rock Island & Peoria and was successively general agent and general freight and ticket agent to February, 1875. From 1876 to 1879, he was division freight agent of the Rockford, Rock Island & St. Louis division of the Chicago, Burlington & Quincy. He was then for eight years commissioner for the Chicago, Burlington & Quincy and Wabash, St. Louis & Pacific pools, and of the Nortnwestern, Central Iowa and Davenport, Rock Island & Moline traffic associations. Subsequently, until 1904, he was superintendent of the Western Railway Weighing Association.

Walter M. Carroll, general storekeeper of the Chicago & North Western Ry., died at Chicago, February 11th, after an illness extending over several months. He was born at Hemlock Lake, N. Y., December 7, 1870. Mr. Carroll had been in the service of the Northwestern for 25 years. For a number of years he occupied the position as chief clerk to the vice-president and president, and later succeeded to the position of assistant storekeeper and general storekeeper.

Herbert DeWayne Carter, assistant freight traffic manager of the New York Central Lines East of Buffalo, N. Y., with office at New York City, died suddenly at Brooklyn, N. Y., on January 18th. He was born on October 16, 1860, at Watertown, N. Y., and was educated in the common schools of his native town. In 1873, he was a messenger of the Dominion Telegraph Company and from 1874 to 1875 was telegraph operator of the Montreal Telegraph Company at Watertown. He began railway work in 1875 as telegraph operator on the Rome, Watertown and Ogdensburg, now part of the New York Central and Hudson River; the next year he was made clerk in the general freight office of the same road, being appointed chief clerk in 1881. From July, 1888, to June, 1890, he was a clerk in the division freight office of the Philadelphia & Erie and the Northern Central, now part of the Pennsylvania Railroad, at Williamsport, and then after serving one year in the general freight office of the Philadelphia & Reading he was made assistant general freight and passenger agent of the Adirondack & St. Lawrence. From May, 1893, when the A. & S. L. was consolidated with the New York Central & Hudson River, until April, 1902, he was division freight agent and general agent of the passenger department of the New York Central & Hudson River at Herkimer, N. Y., and at Malone, and then to July, 1904, he was assistant general freight agent of the same road and the West Shore at New York, becoming general freight agent of the West Shore in July, 1904. He remained in that position until October, 1906, when he was made general freight agent of the New York Central & Hudson River, and in May, 1907, was promoted to assistant freight traffic manager of the New York Central Lines East of Buffalo.

H. D. CARTER.

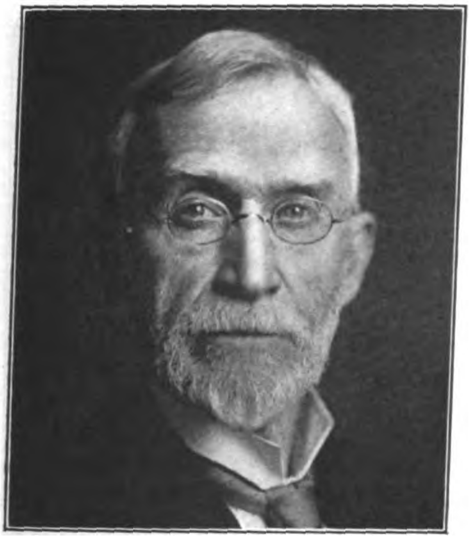
Edward W. Chadwick, superintendent of the Carolina Railroad, died at his home in Kinston, N. C., January 20th, at the age of 43.

W. A. Fowkes, traveling agent of the Pacific Fruit Express, with headquarters at Chicago, died suddenly at his home in that city, on January 15th, aged 44 years.

W. J. Gilmartin, superintendent of the Chihuahua Division of the Mexico Northwestern Railway, at Pearson, Mex., formerly assistant superintendent of the Buffalo & Susquehanna R. R., at Du Bois, Pa., is mentioned as one of those who met death in the Cumbre tunnel in Mexico.

Henry W. Griffith, assistant secretary of the Norfolk & Western, with headquarters at Philadelphia, Pa., died suddenly on January 15th, in New York City.

Edwin R. Holden, former coal sales agent and until 1899 a vice-president of the Delaware, Lackawanna & Western R. R., died February 13th at his home in New York, in his 78th year.



John P. Hess.

JOHN P. HESS, junior assistant superintendent of the relief department of the Baltimore and Ohio Railroad died in Baltimore, February 20th. He was connected with that department of the railroad for the last 32 years. Mr. Hess was born at Uvilla, Jefferson County, W. Va., July 7, 1849, and entered railway service with the Baltimore and Ohio, September 7, 1882, as clerk in the relief department. On September 17, 1888, he was advanced to acting chief clerk of the relief feature, and to chief clerk of the relief department April 1, 1889, having been promoted to junior assistant superintendent of the same department, May 1, 1909.

Being for so many years identified with the savings feature of the railroad, Mr. Hess's name became proverbial for lending a helping hand to many of the trainmen, engineers, shop employes and other railway men in Baltimore and Ohio employ and assisted them in acquiring their own homes. He knew personally most of those who operate the company's trains on its eastern lines and brought the savings feature to its highest standard of development, increasing its membership and popularity.

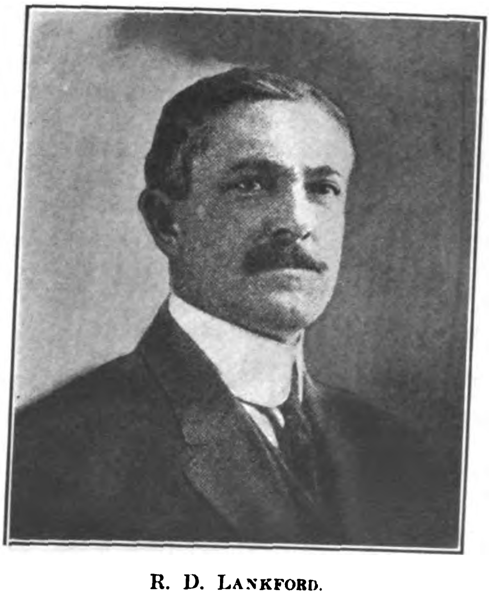
Cyrus V. Jaquith, retired counsel of the P. C. C. & St. L. R. R. died February 14th, at Atlantic City, N. J., at the age of 65 years. He was a well known railroad man, being for the past twenty years chief clerk in the legal department of the Big Four Railroad.

John H. Jones, formerly general coal freight agent of the Philadelphia & Reading Railway, died at his home in Germantown, Pa., February 4th, at the age of 76 years.

Newell S. Kimball, formerly for thirty years district master mechanic of the C. M. & St. P. Ry., at Green Bay, Wis., died in Chicago, at the age of 82 years.

W. B. Linsley, formerly superintendent of the Peninsular Division of the Chicago & North Western Ry., died at his home in Escanaba, Mich., January 10th. Mr. Linsley first went to Escanaba when the Chicago & North Western was extended to that point in 1868. He later became general manager of the road west of the Missouri River and then general superintendent of the entire system, but because of ill health about fifteen years ago returned to Escanaba to resume his earlier position.

Richard D. Lankford, vice-president and secretary of the Southern Railway, also of various subsidiary companies, with headquarters at New York, died on January 15th at his home in Brooklyn, N. Y. His death was due to the accidental turning on of illuminating gas in his bath room. While Mr. Lankford's duties were connected rather with the treasury department and the secretaryship than with the constructive work of rehabilitating the physical property and operation of the Southern Railway, his loyal devotion to the South, to the Southern Railway and to his company's interests made him deeply trusted and respected by his president and board of directors. He was one of those fine type of men who are never too busy to be courteous and who yet accomplish their own work and are always ready to help an associate or subordinate with their work. He was a man whom it was a privilege to have as a friend and one with whom it was a pleasure to do business. Mr. Lankford was born on February 28, 1867, in Somerset County, Maryland, and was educated at Washington High School, Princess Anne, Md. He began railway work on September 1, 1887, as clerk and acting auditor on the Maryland Central at Baltimore, Md., and from June, 1889, to February, 1892, was auditor and treasurer of the Roanoke & Southern, now a part of the Norfolk & Western. From March to December, 1892, he was in the accounting department of the Norfolk & Western. He went to the Southern Railway on June 1, 1894, as cashier, and had been in the employ of that road continuously ever since,



R. D. LANKFORD.

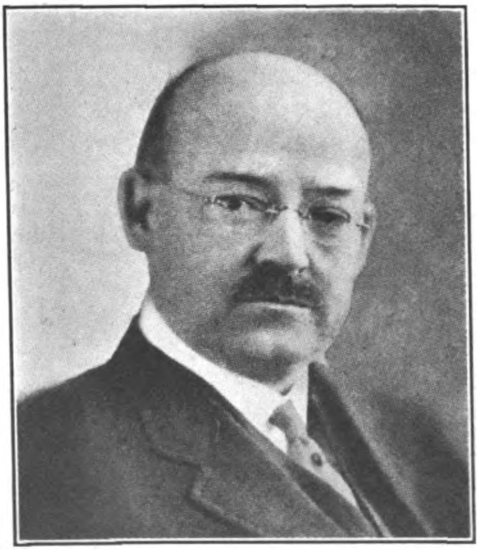
serving consecutively as assistant secretary, secretary and vice-president. He also held office in various subsidiary companies.

Denis Francis Maroney, aged 54, well-known railroad man and economist, died February 2nd, at his home in Arden, Washington County, Pa. He had served as general superintendent of the Pittsburgh Division of the Baltimore & Ohio R. R., president of the Pittsburgh, Shawmut & Northern R. R., president of the Mahoning & Brookville R. R. and president of the Uniontown & Wheeling Short Line. He was an extensive writer on financial and economic subjects.

J. B. Marshel, commercial agent of the C. M. & St. P. Ry., at Dallas, Texas, died suddenly in that city, February 8th, at the age of 70 years.

Albert W. Martin, formerly superintendent of the Boston Division of the New York, New Haven & Hartford, with headquarters at Boston, Mass., died on January 12th, in that city, at the age of 62. Mr. Martin had held various positions on the New Haven, including that of chief clerk to general manager at Boston, assistant general manager for the lines each of New Haven and as superintendent of the Boston Division, from which position he was pensioned about a year and a half ago. He had also held the position of manager of the Boston Terminal Company.

Harry Jerome Neff, general freight and passenger agent of the St. Louis, Brownsville & Mexico, with headquarters at Kingsville, Texas, died at Houston, Texas, January 9th, at the age of 35 years. Mr. Neff began railway work in September, 1897, with the Chicago, Burlington & Quincy in the local freight office at Aurora, Ill. Six years later he went to the St. Louis Southwestern and was successively rate clerk, traveling freight agent and local agent until April, 1908. He became connected with the St. Louis, Brownsville & Mexico in June, 1909, as commercial agent and in September, 1912, was appointed general freight and passenger agent.



CHARLES C. RILEY.

F. S. Savage.

"COLONEL" FRANK S. SAVAGE, advertising agent of the Atchison, Topeka and Santa Fe, died in Topeka on December 20th, in the Santa Fe Hospital. Mr. Savage was born in New York City in 1866. He went to Chicago twenty-three years ago to commence railroad service with the Chicago & Northwestern, resigning a few months later to enter the service of the Santa Fe in the office of the general advertising agent in Chicago.

After seven years of efficient work in Chicago, he was made advertising agent in Topeka, with jurisdiction over Kansas, reporting to General Passenger Agent Connell in Topeka and to General Advertising Agent Simpson in Chicago. At the time of his appointment most of the road's newspaper advertising bills were paid for in transportation, and in the issuing of these passes, Mr. Savage became acquainted with hundreds of newspapermen and he became one of the best known railroadmen in Kansas.

"Colonel" Savage—so named by newspapermen many years ago—was a man of likable traits, an agreeable companion and a sterling friend. His death is felt as a real loss by the many who knew him both in the service and in social life. He is survived by his widow and son Roger.

Sir Frank Ree, general manager of the London & Northwestern Railway of England, died in London on Tuesday of this week. He had been in the service of the company forty years, and general manager since 1909.

Charles C. Riley, general superintendent of transportation of the Baltimore & Ohio R. R., with headquarters at Baltimore, Md., died in Washington, D. C., January 6th, having been suddenly stricken with a hemorrhage of the brain. Mr. Riley was born October 1, 1864, and was educated at Butler University and Central College of Physicians and Surgeons at Indianapolis, Ind., 1880 to 1883. He entered railway service

July 1, 1883, as a clerk in the freight office of the Cincinnati, Indianapolis, St. Louis & Chicago Railway at Indianapolis. From April 17, 1897, to December 7, 1900, he was superintendent of car service and superintendent of transportation of the Baltimore & Ohio Southwestern R. R.; October 21, 1901, to July 6, 1903, car service agent of the Chicago Great Western R. R., and July, 1903, to September, 1904, superintendent of car service of the Erie Railroad. Mr. Riley was then superintendent of transportation of the Erie until November, 1911. He then became assistant to general manager of the Baltimore & Ohio R. R. and since May, 1912, has been general superintendent of transportation of the Baltimore & Ohio R. R., Baltimore & Ohio Southwestern R. R. and the Cincinnati, Hamilton & Dayton Railway.

L. C. Russell, traveling passenger agent of the Grand Trunk, with headquarters at Chicago, died in that city, February 5th.

B. A. Scofield, superintendent of terminals of the Mexico Northwestern Railway, at Cindad Juarez, Mexico, was one of those on board the ill-fated passenger train which was wrecked last week by Mexican bandits.

Neil W. Snow, former division superintendent and assistant to the general superintendent of the Michigan Central R. R., died suddenly in Detroit, January 10th, aged 39 years. Mr. Snow retired from railroad work about four years ago.

August C. Stonegrave, Canadian freight agent of the Central Vermont Ry., at Montreal, Que., died in St. Albans, Vt., February 7th, at the age of 71 years.

Clovis A. Talmadge, conductor of the Southern Railway at Macon, died February 12th, at his home in Macon, at the age of 46 years.

William Hickok Taylor, vice-president of the St. Louis Southwestern since 1907, also a director and a member of the executive committee of that road, and a director of several industrial corporations, died on February 7th, at his home in New York at the age of 56. Mr. Taylor was born in Brooklyn, N. Y., and graduated from Columbia College in 1880. He was a member of the University, Union League, Metropolitan and St. Anthony Clubs of New York, also of the Jekyll Island and Rumson Country Clubs.

June A. Wentz, formerly for many years general agent of the Chicago, Rock Island & Pacific at Chicago, died at his home in that city on January 11th, aged 72 years. Mr. Wentz was born at Binghamton, N. Y., and had been in railway service since 1858. His connection with the Rock Island began in 1880 as agent at Kansas City, Mo.

Samuel Woodward, former president and afterwards receiver of the Cincinnati & Eastern Railway, now a part of the Norfolk & Western Railway, and superintendent of the Ohio & Mississippi Railroad, now a part of the Baltimore & Ohio Southwestern R. R., died February 12th, at Morrow, Ohio, aged 74 years.

Memorial to the Late President Finley.

As a fitting memorial to the late President Finley and in recognition of his interest in agricultural education in the South, President Fairfax Harrison, of the Southern Railway, has addressed a letter to the heads of each of the nine State agricultural colleges in the South suggesting that the agricultural scholarships which President Finley inaugurated in the early part of 1912 be designated: "Southern Railway Scholarship: William Wilson Finley Foundation."

In inaugurating these scholarships, the late President Finley was following his policy of lending every practical aid in the agricultural development of the territory served by the Southern Railway and affiliated companies. Each young man accepting a scholarship must agree to engage in agricultural work, to teach agriculture, or to work on an experiment farm for at least three years in territory touched by one of the lines making the offer. The details as to the conditions under which the scholarships are awarded are in the hands of the college heads.

February Meeting of New York Railroad Club. —At the regular monthly meeting of the New York Railroad Club, held on the 20th ult., Dr. William Churchill, director of the optical laboratory of the Corning Glass Works, read a paper on "Signal Glass." Dr. Churchill discussed at considerable length the question of colors in signal glass. He pointed out that the introduction of green for the proceed indication and yellow for caution, has been followed by great improvement in colored lens, while the adoption of standards by the Railway Signal Association in 1908, has led to the general use of uniform colors. Quite recently the "transmission" quality of green glass has been improved thirty-five per cent. without sacrificing any distinctness of color. Dr. Churchill also reported a great improvement in the quality of glasses for lantern globes which has resulted in reducing by sixty per cent during the past ten years, the breakage of such globes by exposure to snow and rain. This same glass is also used for battery jars and chimneys.

The discussion of Dr. Churchill's paper was participated in by a number of those present in which it was pointed out by Mr. Rudd, signal engineer of the Pennsylvania, that officers of his road had been slow to adopt green for the night proceed color, because the yellow glasses thus far furnished have not been looked upon as entirely satisfactory. He thought, however, that the new yellow glass exhibited by Dr. Churchill would probably prove satisfactory. C. H. Morrison, signal engineer of the New York, New Haven and Hartford agreed with Mr. Rudd as to the hopeful prospect of finding green signals available for daylight service. The discussion was closed by Dr. Churchill who observed that extensive experiments would be needed to decide upon the most suitable size of lens and intensity of colors to meet the varied conditions which would be encountered in using lights to give indications in sunlight, on cloudy days and under all conditions. It was suggested that probably a ten-inch lens would be needed.

Charles A. Prouty on Railway Valuation

EDITOR'S NOTE.—This is the first official statement of the Director of the recently established Division of Valuation of the Interstate Commerce Commission, and was delivered at the Second Annual Meeting of the Chamber of Commerce of the United States, held in Washington, D. C., February 11 to 13, inclusive. It gives understanding of the task involved, the time required, the estimated expense and the motives that prompted the legislation.

I HAVE been asked to address you upon the valuation which the Interstate Commerce Commission is about making of the property of common carriers subject to its jurisdiction. That work has not sufficiently progressed so that its details could be either intelligently or profitably discussed, but there are certain general phases of the matter which will interest, and should be understood by, the members of your organization. Considered in that broad aspect, the subject naturally divides itself into three heads:

First. The thing to be done.

Second. The time and expense required.

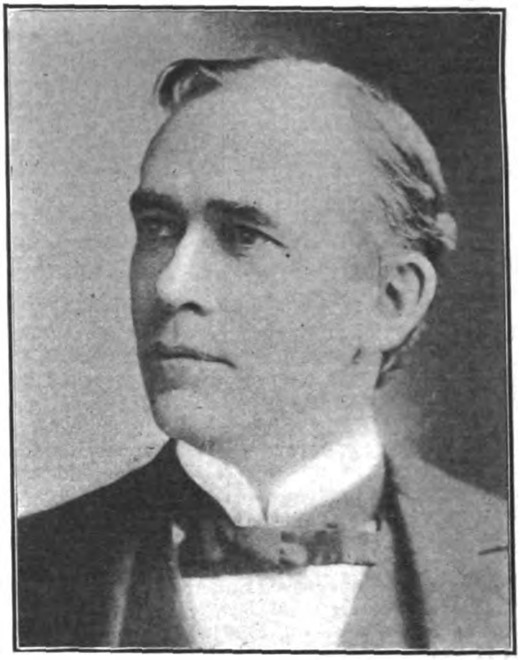
Third. The benefit to be derived.

THE THING TO BE DONE.

The Commission proceeds under a special Act of Congress of March 1, 1913. That Act, which was evidently drawn after much consideration and with great care, defines in detail the duty of the Commission and should be carefully read by everyone interested in the work. This act embraces the property of all common carriers subject to the jurisdiction of the Commission, but I shall speak to-night of railways alone.

By the terms of the Act the Commission is required to ascertain and report the cost of reproducing new the railroad and other property of every railway company in the United States, and the cost of reproduction less depreciation. Evidently, before it can be determined what it would cost to build a particular railroad as it to-day exists, we must know exactly where and what that railroad is. This means that as a preliminary to the work of valuation every railroad must furnish the Commission with maps and plans which will identify its property. Investigation shows that some few railroads in the United States have to-day such maps and plans; many railroads have maps and plans which contain a part of the information required but not the whole; while many others possess nothing of this sort worth naming. So far as these plans already exist, even though not in the most desirable form, they will be used; in so far as present maps can be added to and extended this may be done, but where no maps exist new ones must be prepared. When this work is completed, there will be found in the office of the Commission at Washington an accurate map and inventory of the property of every railroad engaged in interstate business as of June 30, 1914, together with other maps and plans showing all subsequent additions to the property. This of itself is a work of great magnitude which must be done by the carriers as a part of the general undertaking. You as business men will agree that while some expense will be entailed upon our railroads it will be to them well worth the cost.

When the Commission has been furnished with this complete inventory by a railroad it must proceed to verify it; that is, it must ascertain whether the facts stated in the inventory are true. It must determine the number of yards of earthwork, the number of yards of rock, the culverts, the tunnels, the bridges, together with the character and cost of construction. It has been decided that this information cannot properly be obtained without sending a surveying party over every mile of the railroad. Sometimes the progress of this party can be comparatively rapid; at other times it will be slow; at all times the work must proceed with sufficent care and detail to make certain that the figures obtained are correct. If this valuation is to serve its purpose it must be so made that it will not be open to just criticism. The general public must feel that the work has been properly and thoroughly done, and that the result is reliable. This would not be if any fact which could be accurately ascertained were guessed at.



HONORABLE CHARLES A. PROUTY,
Director of Physical Valuation.

It will be necessary to note in the course of these surveys and to determine in various other ways the amount of depreciation so that when the work is completed the records of the Commission will show the extent and character of the property of each of our railroads, the cost of rebuilding that railroad as it exists, and the amount of depreciation in the several articles which go into the railroad as well as in the railroad as a whole.

This is mainly an engineering task. The time and expense will be considerable; indeed, herein arises the major part of the outlay, but no serious difficulties are involved, nor should the result when ascertained be in serious doubt. It should be possible for the people of this country to know upon the completion of this work what it would cost to rebuild its railroads new and to what extent those properties have depreciated as compared to new.

This work is often referred to as a "physical valuation" of railways, and most people probably understand that this cost of reproduction, with or without depreciation, determines the value of the railway so that, having ascertained and reported these facts, the duty of the Commission has been discharged. But this is by no means true. Up to the present time the holding of the Supreme Court of the United States is that cost of reproduction new, or cost of reproduction less depreciation, are only factors entering into the final question of value. Many other things have been enumerated by that court as bearing upon the value of the property. The valuation act itself requires the Commission to ascertain and report the cost of construction, the amount of money which has been invested in the property, and the sources from which that money has been derived; to give, in short, a complete corporate and financial history of these properties; to take note of the earnings of the property, and having all these facts before it to determine from a just consideration what is the value of the property itself. I am not saying that it may not finally come to pass that the cost of reproduction will be the controlling factor; many people so insist. Others urge with equal earnestness that the true test of value, so far as it can be ascertained, is the money invested in the property. I express no opinion upon any of these propositions. I simply call your attention to the fact that the Commission is required not merely to ascertain the cost of reproduction, but to state the value of the property, and that in attempting to do so many delicate and difficult questions may be encountered. Let me instance one or two of these as illustrative.

The first railroad which the Commission is proceeding to survey in what is known as the Pacific District is the San Pedro, Los Angeles and Salt Lake, extending from San Pedro, California, to Salt Lake City, Utah, some eight hundred miles. Most of this road has been built in comparatively recent times, and the circumstances and cost of construction are fairly well known.

The course of the road is for the most part through an arid desert. A certain section of it, when built, was located where no man thought it could ever be disturbed by floods, yet shortly after it was opened for operation the floods came and carried out this portion. It was at once reconstructed upon a new location supposed to be beyond all possible danger from a recurrence of the previous disaster, nevertheless the waters again came and washed away this same section; whereupon it was rebuilt upon a third location, beyond all possible reach of future trouble from this source.

Considering the nature of the road and the people who were interested in its construction, it seems probable that due caution was exercised in the original location; that is, that a reasonably prudent man building this railroad as those men did, to be operated by them as a railroad, would have located it as it was located. It is undoubtedly true that the second location was made with great care, and was believed to be beyond possible danger. It has cost a large sum more to rebuild this road than it would have originally cost to construct it where it is to-day. Now, in determining the value of this property what if any allowance is to be made for this experimental outlay? If the Government itself had constructed this railroad it probably would have had the same experience and would have expended the same amount of money which the owners actually did.

This illustration puts the question in a very striking form, but the same idea enters more or less into the valuation of most of the railroads of this country. There has of necessity been a certain amount of experiment before hitting on the right and proper thing. Does this development expense constitute an element of value which may be recognized to-day, or must the owners of these public utilities stand the loss of their mistakes in the same way that the owner of a private enterprise would? Vast sums of money are involved in the answer to that very simple question.

Take another illustration of a different character. Some years ago in a case pending before the Commission the Northern Pacific Railway Company had occasion to prove the value of its property, and it did so by showing the cost of reproduction. For this purpose it gave the units which entered into that railroad as it then stood. Among other things it showed the amount of land upon which its right of way was located, and what it would cost to acquire that land for railroad purposes at that time, claiming that this cost of reproduction was the value of its property.

The Northern Pacific runs through the city of Spokane. When the road was built that city was of small account but it has come to be of much account, and in the process of development it has grown up on both sides of this railroad. The Northern Pacific claimed, and it may very well have been true, that the cost of acquiring its right of way through the heart of the city of Spokane at the time of the hearing would be at least five million dollars. The original cost to the railroad was nothing, the right of way having been entirely donated either by the Government or by private benefaction. Now to whom belongs this five million dollars? Has the Northern Pacific the right to tax the public for a return upon that amount? Whether it has is a thing of great consequence, for nearly one fourth of the entire value of the Northern Pacific Railway, as shown in that proceeding, was the value of its right of way, much of which was due, as in the city of Spokane, to increase in value over its original cost. This question of the unearned increment presents in the valuation of our railways a difficult problem.

Illustrations like those two might be indefinitely multiplied, but these are sufficient to exhibit the thought I wish to emphasize: namely, that this valuation of our railways is not a mere engineering problem, involving the cost of reproduction or the amount of depreciation alone. Indeed, it is not properly an engineering problem at all but rather a social and economic problem; a legal problem; in its final analysis a political problem. It is for the Commission first of all to ascertain all these facts and from them to deduce what in its opinion is the fair value of these properties. That conclusion may undoubtedly, in some respects and to some extent, be modified by the courts. In the final analysis it will be for the people to say what measure shall be meted out to these railways. While courts and commissions may influence and even temporarily determine questions of this kind, the will of the masses finally prevails, and it is therefore of first importance that the body of the people should have accurate information.

Looking to the work of the Commission alone, and answering the first division of my subject, the thing to be done is this: To marshal every fact obtainable with respect to the present condition and the past history of our railways, and from a just consideration of all these facts to determine the fair value of the properties to-day.

The Time and Expense.

The Valuation Act became a law on March 1, 1913, and the Commission was required by its terms to begin the work within sixty days and to prosecute it with all due diligence. The Commission entered upon this task within the limit specified but up to the present time no substantial progress has been made in the body of the work. While the Commission was permitted by Executive order to employ ten engineers who will have general superintendence of the engineering work, our employes, both engineers and accountants, must be obtained through the Civil Service Commission. Since the Government had never done any work of this character, that Commission had no rolls from which competent persons could be employed, and although the preparing of such registers was at once begun and has been prosecuted with all possible diligence, it is only within the last few weeks that they have been actually available.

For the purpose of making the surveys to which allusion has been made the country has been divided into five districts, by States, each containing approximately fifty thousand miles of railroad. Each of these districts will have an organization of its own which will conduct the surveys within those particular limits. Subsequently these surveys will be worked out, partly in the district and partly at the head office in Washington. Surveys began in all the districts except one about February 1, and will begin in that district about February 15.

It has seemed to the Commission the part of wisdom to proceed with caution until sure of its ground. In this view a railroad has been selected in each district upon which these surveys will proceed with deliberation and in such manner as to afford a kind of instruction school to all employes. This preliminary work will occupy three or four months, which means that we shall not be in position to rapidly develop our organization until about July 1. Beginning then, or slightly before, our force can be rapidly increased.

While it is somewhat hazardous to make an estimate of the time required without more experience than we have had, it is my opinion that the field surveys ought to be concluded in from four to six years from July 1st next. It is hoped that the accounting and other work will keep pace with our field surveys. The putting together of these facts, that is, the actual valuation will necessarily lag somewhat behind the obtaining of the facts themselves. The Commission will in the near future have all the data with respect to some railroads, but whether a valuation will be at once announced in such cases must depend upon the method which the Commission selects for determining the various questions which will arise and to which reference has been made.

Any estimate of the expense must be even more unreliable than that of the time. Railroads have been valued both by public authority and by themselves, and the cost of these valuations has run all the way from two dollars to seventy-five dollars per mile. I have already said to you that this work, in order to meet its purpose, must be thoroughly done, and this will require a larger outlay upon the part of the Federal Government than has usually been made by the States. Moreover the work required by this Act is much more comprehensive than has ever been undertaken by any State. Knowing what must be done, the methods which must be followed, the rate of accomplishment which has been attainable in other places, I should say, basing my estimate upon the experience of State commissions, that fifteen dollars per mile would be sufficient to cover the engineering part of the work and ten dollars per mile the accounting and other features. This would aggregate for the entire 250,000 miles between six and seven million dollars.

If the experience of railroads be consulted an entirely different conclusion is reached. The cost, as reported to us, of valuations conducted by the carriers themselves runs from forty to eighty dollars per mile. It is true that in this work by the railways certain things are included which will not be done by the Commission, but to offset this most carriers have ascertained simply the cost of reproduction, with no reference to depreciation, and with but little accounting work. If our information is correct and if the Government cannot do this work cheaper than the railroads themselves, it will cost at least fifty dollars a mile to complete the work. I told the Appropriation Committee of the House last July that from what I knew about the subject then I should not advise Congress to enter upon this undertaking unless it was ready to expend at least twelve millions, and another six months' reflection has not changed that opinion.

While, however, this is a large sum, and much more than Congress contemplated when the Act itself was passed, it is the merest trifle compared to the enormous values involved. The capitalization of our railroads at the present time aggregates nearly twenty billions of dollars. It has been recently estimated that these securities at their present market value are worth from fourteen to fifteen billions. The cost of this work, therefore, cannot exceed from one tenth to one twentieth of one per cent of the value ascertained, a sum utterly insignificant in proportion to the magnitude of the thing dealt with.

Look at this from another standpoint. One purpose—to some minds the principal purpose—of this valuation is to determine the amount upon which the public should be required to pay a return to the owners of these public utilities. Assume that this valuation varies the amount upon which such return should be paid by only five per cent. Five per cent of twenty billions is one billion, and a return of six per cent upon one billion is sixty millions annually. The difference to either the public or the railroad may therefore well be, for every year, five times the entire cost of the valuation itself. Certainly there is nothing in the expense which should deter the people from demanding the prosecution and completion of this undertaking in a thorough and competent fashion.

THE BENEFIT.

What, finally, is the purpose of and the benefit to be derived from all this outlay of money and of energy? There are many advantages, some of which I shall refer to without thereby intending to minimize the others. And first let me call your attention to the incidental benefit to the investing public.

Many persons seem to hold the opinion that the Government in dealing with monopolies like the railroad owes nothing to the investing public. Caveat emptor—let the buyer take care of himself—such has never been my own thought. The investor is a necessary part of the well-balanced state, and is often in need of protection from public authority. It is the duty of the Government within reasonable limits to see to it that the would-be investor is not hoodwinked in the making of his investment and that the value of his investment, when once made, is not improperly destroyed.

In railway investment the public has a more immediate interest. Just in proportion as railway securities commend themselves to the investing public it is possible for the railway to obtain the money with which to make necessary improvements to its property. Whatever benefits the credit of our railways; whatever gives to railway securities the investment quality with bank stocks and municipal bonds; whatever, in a word, takes from railroad stocks the speculative and uncertain element, indirectly reduces the cost of furnishing railway service and thereby inures to the benefit of the general public.

Now when any investor can know from reliable sources the exact character of his investment; how much it would cost to reproduce the property; in what state of efficiency that property is being maintained; above all, what is the value of that property for use as a railroad, there has been injected into railroad securities an element of certainty and of permanency which does not now exist. It seems to me therefore that this work of valuation will be of incidental benefit to the railway investor and so to the general public. While this has not been generally, perhaps not at all remarked upon as an advantage, it will turn out to be a substantial one.

To the general apprehension the object of this valuation is to determine what rates our railways should be allowed to charge for their services to the public.

While the property invested in our railroads and other public utilities is private property, the Government has, in consideration of the nature of the service rendered, the right to impose upon this property the terms and conditions under which it shall be used. It may, in the case of a railroad, determine the character of its equipment, the schedules upon which its trains shall run, and in general may control the operation of the property in so far as the public has an interest therein. It may fix the rates to be charged by that railroad for the transportation of persons and of property and for any other service which it renders to the public. To this power of the Government over such private property there is this important qualification: Under the Constitution of the United States as interpreted by the Supreme Court of the United States such property must be allowed a fair return upon the fair value of the investment.

What is a fair rate of return depends, probably, to some extent upon the character of the property and its location. The relative functions of the legislative and judicial branches in the fixing of that rate are not yet clearly defined. All just men concede that it should be substantially the same as the return obtainable from private investment having the same incidents. Manifestly it is not a difficult thing to determine the rate of return to which this property is entitled. There still remains, however, the value upon which this rate is to be computed, and until that value is known it is impossible to determine what total income the property is entitled to earn and, therefore, to fix the charge which may be justly made against the public.

The rates of public utilities are at the present day usually fixed by commissions, both state and federal. It is perhaps the natural inference that when the value of the property has been determined and the rate of return fixed the work of the commission in establishing the charge of the public utility is comparatively easy. It is only necessary to multiply the value by the rate and to allow a charge which will yield that income.

And this, with some important qualifications, is true as to certain kinds of public utilities. Take, for instance, a water plant or a gas plant. This serves a single community. As a rule it meets no competition in that service. The amount of its business is known or can be forecast with reasonable accuracy. Even matters of depreciation and such like have come to be pretty accurately understood. It is possible, therefore, to fix with some confidence the rates of such a utility when the value of the investment is known.

With the railroad, however, this is entirely different for the reason that it seldom happens that a single railroad can be considered by itself. The greater part of the business of the railways of the United States is subject to competitive conditions of one sort and another which are largely controlling so that the rates of one are necessarily bound up with those of another. A moment's thought will show the extent to which this is true.

Nearly every station at which considerable quantities of traffic originate or are delivered is served by more than one railroad. It is possible, for example, under present switching absorption tariffs in force at the city of Chicago to reach any point within the switching limits of that city at the same rate by any line which reaches the city. The same is in substance true of the city of New York and the great industrial district of which New York is the center. It is also true that while two given points may each be served by but two railways a great variety of routes between those points can be found by choosing different intermediate carriers. For example, lumber from almost any point of production in the South can reach Chicago by a variety of routes through the various Ohio River gateways. Now while it may occasionally happen that the rate by one route is different from that of another, broadly speaking the rate by competing rail lines is the same. Whatever charge is made by one line between New York and Chicago must be made by all; whatever charge is imposed for hauling lumber to Chicago by one route must be the same by all competing routes.

Nor is direct competition of this kind the only competitive force of controlling influence. An examination of conditions in almost any agricultural State like Iowa, for example, will show that the farm upon which the corn or the wheat is grown lies midway between two lines of railroad so that the product of the same can be sent to market by two, and often by three, different carriers. Manifestly the rate made by each of these carriers for the transportation of this farm produce must be substantially the same. If the farm of Mr. A is five miles from the Northwestern and the same distance from the Rock Island, the rate of transportation under which his wheat and corn and live stock can reach Chicago must be the same bv both lines, and the financial necessities of either line are not of the slightest significance. This kind of competition, which is sometimes denominated by railroad men "cross-country competition," powerfully influences and often absolutely controls the rates upon certain commodities which furnish large amounts of traffic.

Still further it often happens that where the service is purely local and can only be rendered by one railroad still the rate which must be applied is dictated by competitive conditions. A coal mine may be served by a single carrier, but that carrier cannot therefore impose whatever rate it sees fit upon the product of that mine, for, unless the charge to the point of consummation is as favorable as that from some competing mine by some other carrier, the mine itself cannot do business and the railway loses the traffic. This sort of competition is of universal application and of tremendous influence.

Without further pursuing this subject, which of itself is a broad one, it will be seen that the railroads of this country are so bound up together that their rates are largely interdependent. It is impossible to shake a single railroad free from every other and fix its charges upon the basis of a fair return upon its fair value as you would in case of a gas or water plant. The rate established for one, of necessity influences and frequently absolutely determines the rate of all, a fact which must never be forgotten in discussing this subject.

Now it is evident that if the Commission should select that road most advantageously situated, that road whose business is the largest and upon which the conditions of operation are the most favorable, and should so adjust its rates as to yield a return of six per cent upon its value, every other railroad standing in competition with it would receive less than a six per cent return and some railroads might receive nothing whatever. The schedules under which one carrier would earn a fair return upon its investment might not even pay the operating expenses of its competitor. Upon the other hand, if that road laboring under the greatest disadvantage were to be selected and such rates established as would permit it to make a return of six per cent upon its investment, its competitors would one and all be receiving an undue return upon their investment.

A certain amount of traffic is strictly noncompetitive. What proportion this may bear to the whole I have no idea; the per cent would be small. Theoretically it might be possible for railroads to take up the slack, so to speak, between what would be a fair rate for one and that for another by an adjustment of rates upon this local business. In the Minnesota Rate Case and cognate cases, recently decided by the Supreme Court, it was held that while the principal railroad systems involved had not established confiscation and must therefore submit to the rates prescribed, certain roads of minor importance had made out their case. These lines, in so far as they could, were allowed to charge higher local rates than the others.

The effect of this would be to establish extremely high local charges upon certain lines and extremely low local charges upon others. Upon main lines and upon lines of dense traffic, rates would be low; upon branch lines and those with less traffic, charges would be high. The general effect would be to concentrate business into certain localities, whereas it has always seemed to me that the aim should be to so adjust transportation charges as to secure a general diffusion of values and of business. If this Government operated its railways rates would be generally the same upon all lines in given sections.

While, however, I wish to make it perfectly plain that the problem of establishing railway rates will not be solved by this valuation, I desire to say with even greater emphasis that that problem will be enormously simplified. It can be known with certainty whether the general level of rates is or is not too high, and in establishing the charges to be observed by a single carrier, even in fixing the rate upon a single commodity, it will be of much benefit to know the value of the property involved. Every railroad commissioner will join with me in saying that here is the only solid foundation upon which he can stand; that the determination of these values is indispensable to the just and intelligent administration of his work.

While this valuation will be of incidental benefit to the investor, while it is essential to the work of the rate-making tribunal, it seems to me that its greatest immediate value is political. The state of the public mind towards our railways is such that this information is absolutely necessary.

Some years ago the Commission had occasion to examine the reasonableness of rates to points upon the Pecos Valley Line of the Santa Fe System. The railroad under consideration runs from Amarillo, Texas, into and through what was then the Territory of New Mexico. That part of the line in Texas had been constructed under a Texas charter, and therefore in conformity with the Texas stock-and-bond law under which the capitalization could not exceed the investment in the property. The railroad in New Mexico had been built under a charter from that territory without any limitation upon the amount of securities which could be issued. The cost of the road was substantially the same in Texas and New Mexico—perhaps slightly greater in New Mexico. The capitalization of the Texas company was $8,000 per mile; that of the New Mexico company $42,000 per mile.

This is a somewhat striking instance of what has happened at certain times in certain parts of this country in the building and capitalizing of our railroads. From what is known of such operations there has come to be a deep-seated conviction in the minds of many people that our railroads as a whole are enormously over-capitalized and that the public is paying interest and dividends upon securities which represent no actual value.

Upon the other hand, it appeared in the Eastern Rate Advance Case, decided in 1910, that the Pennsylvania Railroad had in the ten years preceding that investigation put into its properties east of Pittsburgh more than two hundred million dollars from earnings, which, therefore, was not represented in the capital account of that company. It is well known that many other railroads have improved their property out of earnings without any corresponding increase in their capital accounts. This leads many to the conviction that while individual railroads may be overcapitalized our railroads as a whole are worth more than their stocks and bonds.

Consider the developments of the investigation into the affairs of the St. Louis and San Francisco System, conducted by the Interstate Commerce Commission. Consider conditions in New England to-day, where the fate both of the Boston and Maine and the New Haven systems is trembling in the balance. None of these questions can be answered; none of these situations can be justly dealt with until we know the actual value of these properties. This is the question which arises before the student of this railway problem at every angle. This is the question which must be answered before this problem can be intelligently discussed. For this reason, above all, it is important that this work should be pressed to a completion in the most expeditious and the most trustworthy manner possible.

The Burden of Unnecessary Legislation

SUMMARY OF ADDRESS OF IVY L. LEE, EXECUTIVE ASSISTANT, PENNSYLVANIA RAILROAD COMPANY, BEFORE TRAFFIC CLUB OF NEW YORK AT WALDORF-ASTORIA HOTEL, NEW YORK, JANUARY 27, 1914.

THE general public is but little aware of the enormous amount of legislation which has placed peremptory burdens on railroad operation.

In 1913, there were 42 State legislatures in session. In them, 1,395 bills were introduced affecting railway operation, and 230 such bills were passed. In 1912, only 48 such laws had been passed out of 292 introduced in 19 legislatures.

From August 1, 1906, to January 1, 1914, the Pennsylvania Railroad Company incurred expenses of approximately $12,000,000 on account of new laws, Federal and State, governing railroad operations. Some of this legislation did good, and I am not here to complain of it, but much of this legislation has entirely failed to achieve its declared purpose.

1. The Federal law restricting the hours of telegraph operators to nine hours resulted in an actual increase in the number of men found asleep on duty. Men with heavy continuous duties had not previously worked more than eight hours any day. The twelve-hour men had light work, but they knew when the day's work was over that they must return to duty twelve hours later. Consequently they took care of themselves. The greater leisure under the nine-hour law has encouraged misuse of time with its consequent results.

The law was designed to secure additional safety. It has not added appreciably to safety, but it costs the Pennsylvania Railroad Company about $200,000 a year,—the annual interest at 5 per cent on $10,000,000 of capital.

2. The semi-monthly pay bill in several States has encouraged extravagance and made it necessary for railroad companies to exercise unusual vigilance to prevent men going on duty under the influence of liquor. Wiser heads in our large railroad centers deplore the bill. This measure adds nothing to efficiency, and costs our company $250,000 a year,—the annual interest on $5,000,000 of capital.

3. Some twenty States have enacted laws, and there is pending at Washington a bill to cover the nation,—compelling the use of electric headlights of high candle power. Everyone who has driven an automobile at night knows that when he approaches a car coming in the opposite direction, he is temporarily blinded by the light. So it is with engineers running trains on double or four-track railroads. These measures are not in the interest of safety; they increase the danger in many cases. English railroads, for example, use no headlights at all.

4. Our own company is subject to laws which compel us to utilize about forty regular passenger cars for the benefit of crews on trains carrying baggage, express or mail only. The crew would be perfectly comfortable in one of the other cars. These cars cost about $10,000 each. Thus $400,000 of equipment is put to this wasteful use.

5. Extra Crew Laws, to which we are subject in many States, compel the employment of a large number of unnecessary men. These men do not contribute to the safety or the comfort of the public. Extra crew laws are costing us $550,000 a year in Pennsylvania; $180,000 a year in New Jersey, and $120,000 a year in New York; $850,000 in these three States, or the annual interest on $17,000,000 of capital.

The few laws mentioned alone thus impose an annual burden upon our own company equal to the annual interest on $32,000,000 of capital. If we had spent that amount of capital to provide needed facilities for the public, additional safety appliances, and removal of grade crossings, and did not earn any return upon it, we would be even better off than we are to-day, pouring out these sums without corresponding benefits either to ourselves or the public we serve.

Safety is essential at all costs. But in an imperfect world, all perfection is not instantly attainable. Safety cannot be insured by resolution or mechanical device. It is primarily a resultant of care and discipline.

Railroad officers are interested in safety above all else. Any accident on a railroad places its management on the defensive. Laws to compel railroad managers to make their railroad safe are ineffective unless the money with which to do it is obtainable. If that money is obtainable, no one is more delighted in assuring safety than the railroad officer himself.

It is not necessary to pass laws to compel bankers to keep their money in fireproof safes. If the banker can afford it, he buys an armor-plate vault; if not, he gets the best thing he can. His very business life depends on his guarding safely the money of his customers.

So with a railroad, safeguarding the lives and property of patrons is the very essence of operation. It's the human nature of it.

But everything can't be done at once. It would cost $600,000,000 to replace every wooden passenger car in this country with an all-steel coach. It would cost the Pennsylvania Railroad $600,000,000 to remove all the grade crossings on its own system alone.

The most important thing must come first. A mandatory law compelling certain expenditures may be desirable in itself, but as preventing provision for other pressing needs, becomes really a public injury.

It is therefore of supreme consequence that railroad managers, sincerely striving to do the best they can, have every stimulus and aid in meeting the many conflicting demands made upon them and not be compelled to waste the limited funds at their disposal upon unnecessary and useless expenditures.

The Responsibility of the Common Carriers Under Tariff Legislation

From an Address Delivered by E. D. Hotchkiss, General Freight Agent of the Chesapeake and Ohio Railway at the December Meeting of the Richmond Railway Club.

THE Interstate Act has been on our statute books since February 4th, 1887, but was not until after the passage of that Amendment in June, 1906, commonly called the Hepburn Act and the subsequent amendments of 1910, that it was vitalized and became the regulating force in transportation matters it is to-day. It may, therefore, be said that the present day tariff dates from 1906.

The carrier is now required to print, post and file with the Interstate Commerce Commission tariffs which will not only show all its rates of transportation between different points on its own route and points on the route of any other carrier when a joint rate and route have been established, but it must also publish all such accessorial charges as storage, demurrage, icing, stockfeeding, etc. It must also publish all privileges and facilities granted and allowed, such as terminal switching, transit, inspection, elevation, etc. It must go further and publish any rule or regulation that may effect the value of the service rendered the shipper or consignee. There is no form of service which the carrier either with or without compensation may hold out to the shipper or consignee save that published, posted and filed in its tariffs. Having thus initiated the schedules, the carriers must abide, under severe penalties, by them. Here rests the responsibility of the local freight agent.

The extent of this responsibility is emphasized when I point out that even the Interstate Commerce Commission itself is entirely without jurisdiction or power to modify, affect or alter the published tariff of the carrier save in the manner fixed by the Act itself. One of the former Commissioners speaking on this subject has gone so far as to say in effect that on the carrier having initiated its tariff, posted and filed it as provided by law, it has all the force and effect of an Act of Congress itself.

The law charges every person with a knowledge of rates. This is a practical absurdity, but it is nevertheless the foundation upon which the superstructure of the Interstate Act is built. Tariffs must, therefore, be posted for the convenient inspection of the public.

The Act as amended by the Hepburn bill requires that "Such schedules shall be plainly printed in large type and copies for the use of the public shall be kept posted in two public and conspicuous places in every station where freight is received for transportation in such forms that they shall be accessible to the public and can be conveniently inspected."

This provision is not materially different from that of the Original Act, but by the Hepburn Act, the Commission was also given discriminating powers to modify this requirement by special or general order.

Practical experience had, long prior to the passage of the Hepburn Act, demonstrated the posting (out of the custody of the agent) two copies of a tariff in a freight station was a useless burden upon the carrier. It was impossible to prevent their almost immediate destruction or mutilation, while on the other hand there was no compensating advantage to the public by having the tariffs out of the custody of the agent. It had become almost an universal practice among carriers to place the tariffs in the custody of the agent, and to post a notice in two conspicuous places in the stations to the effect that the tariffs were on file with the agent and subject to inspection on application.

In the exercise of the power given them in the Hepburn Act, the Commission promulgated a general order, which in its essentials is the same in plan as that initiated by the carrier.

By it the carrier is required to place in the custody of its agent all rate schedules applying at or from that station and to post a public notice of the fact. The carrier is required to supply such agents with suitable facilities for keeping the schedules in ready reference order. The agent is required to give any information contained in the tariffs; afford opportunity to examine any tariff without requiring or requesting the inquirer to assign any reason for such desire and to lend assistance to all seekers of information.

The carrier shall also require its traveling auditors to check each station tariff file at least once each six months unless special traveling tariff inspectors are employed. The requirement of this order is a substantial concession and saving to the carrier.

The Commission have announced in connection with it that it depends on the honor and good faith of every official to whom the duty of carrying out this order rests and to resolve every doubt in favor of the spirit of the law.

Here we have the joint responsibility of the local agent, division superintendent, traffic officers in charge of tariffs and the auditing department.

But we must not only post tariffs that the public shall have opportunity to meet the requirements of the law charging them with a knowledge of rates, the tariff must be intelligible and free from ambiguities.

This, I am sorry to say, has not always been true.

An amusing incident occurred not so long ago illustrating the point.

A certain general freight agent was called before one of the Commissioners; handed a tariff bearing his signature and requested to quote the rate on a given article between two points on his own line. After a long and embarrassing delay and much mental anxiety he finally found a rate, but lo! the joy of finding was at once dissipated by a note that made the application of the rate dependent upon certain contingencies and rates to be found in another tariff. After viewing the other tariff his perplexity was only increased. He consulted an atlas, then a shippers' guide. By this time he was so utterly lost in the maze of doubt that he had to "give it up."

My friends, how can the shipper who is charged with a knowledge of rates or the agent who is charged with applying them lawfully be expected to meet this obligation when the source from which he is to obtain that information is so wrapped up in doubt, as to cause the expert to "give it up."

I am glad to say that great advance and improvement in this direction has been made. By a set of rules promulgated by the Commission after consultation with and advice of the railroad company's tariff authorities, uniformity in the arrangement of tariff matter has been reached. This, together with the removal of ambiguities from tariffs, has done much to simplify and make the meaning clear, but we have not by any means reached perfection. Much is yet to be, and will be accomplished in the light of experience and in this connection, a movement is now on foot—the initiative being correspondence between the chief executive of one of the Western lines and the chairman of the Interstate Commerce Commission—looking to conference between the chief traffic officers and the Commission to the end that further improvements in tariff construction, if practicable, be accomplished. Theoretically the language of the tariff should be as carefully chosen against doubtful meaning as that employed in a will. It took many generations of the brightest minds to reach the present degree of perfection in the latter, yet now we sometimes hear of wills being "broken" because of doubt of the language of the testator.

The cost of compilation and printing of tariffs is properly a subject for serious concern to the carrier. This expense, already great, is increasing through the requirement for frequent reprinting of tariffs under those mandatory rules of the Commission which require reissue after the volume of supplementary matter, both as to number of supplements and extent of matter has reached certain limits. Larger stocks of tariffs are required to meet the demands of the industrial traffic managers, tariff bureaus of chambers of commerce, boards of trade, etc. This increased cost calls for the ingenuity and skill of the traffic officer in bringing the number of tariffs within the smallest limit.

A great economy in this direction rests in competing routes uniting in common tariffs, between common points, thus cutting out that immense expense of duplication by individual issues. I have long advocated common tariffs and have adopted them on the line I represent whenever the necessary concurrence of the other interested lines is secured. The main opposition to this plan has been the jealousies of the old established routes and trade names. I think the value of these factors is overestimated and entirely incommensurate with the great difference in the cost of producing tariffs under the two systems.

The telephone and telegraph have brought the manufacturer, jobber and consumer in close touch and small stocks and quick sales is the order of the day.

The vital consideration in transportation to-day is service. The route that offers this does not have to fall back on its pedigree of a long established trade name to secure its share of competitive business. It has been estimated that the cost of the recent reprinting of tariffs in Official Classification territory in the efforts of the carriers to secure a small advance in their rates will aggregate over two million dollars. I think I am within the bounds of conservatism when I estimate that this amount might have been reduced 25 per cent by the use of common tariffs.

The local agent can aid materially in effecting needed economies by carefully preserving and filing tariffs immediately on receipt. Cases have arisen when the cost of reprinting of a tariff is necessary to supply shortages in agents' public files, due entirely to failure of agent to preserve the original copy.

Time will not permit a further discussion of this subject. I have endeavored to limit the discussion to those features of tariffs which bring them within the province of other departments, but I cannot close without some reference to the importance of their strict observance by those charged with executing them. There are those of us who may think that the requirements of the law in this respect is too inelastic, unreasonable and unnecessary, but, good or bad, right or wrong, the law in this respect is too binding and the responsibilities and liabilities of the carrier too great to be jeopardized by any unauthorized and ill-considered act by employes charged with the duty of enforcing tariffs, however well meant.

Canceling the Privilege of Industrial Lines.—Executive officers of the Eastern railroads at a meeting held in Chicago on February 18th, unanimously voted to cancel switching and other allowances to all Chicago industrial roads on and after April 1st. This action conforms with the suggestion of the Interstate Commerce Commission and to the inference made by that body that applications for rate increases are inconsistent, while extensive favors are being granted by railroads in the form of allowances to important shippers. It is also reported that the officers of the Western roads who met with the Eastern executives, agreed to take similar action although no date has yet been set. As soon as the tariffs can be printed and filed, all rates and concessions granted by carriers in Official Classification territory to industrial railroads will be cancelled.

Regulating New Security Issues

EDITOR'S NOTE.—The following article, published in the New York *Times Annalist* of February 9th, indicates how the power over new security issues has been exercised by the New York State Commission, during the past few years to the satisfaction, in the main, both of investors and corporations. This interesting survey of the work of the New York Commission would appear to have more than an indirect bearing upon the National question and will therefore, prove of interest to our readers.

WHILE everybody has been debating about the wisdom of having the Interstate Commerce Commission supervise the issuance of securities by the railroads of the United States, the Public Service Commission of New York has been regulating the output of stocks and bonds by the steam railroads and other utility corporations in the State to an aggregate of capitalization exceeding that passed upon by all the other State commissions combined, and big enough to serve as a specimen of regulation for the National Commission. However anybody else may feel about it, the New York Commission believes that it has already got under way a system of examination of the finances of New York corporations that is good for the public, the corporations themselves, and the particular individuals who invest money in the stocks and bonds issued by the corporations. It has just made public a report on this feature of its general work of regulation, in which it says:

"While the Commission, as it has frequently stated in its opinions, does not in making authorizations of securities in any way guarantee that the securities so authorized are a good or safe investment, yet its object is to render the company's financial statements and make its own conclusions constitute such basis that the investor will not be misled. It is believed that no other single agency will in the end result in better service or lower rates than an effective regulation of the financing of public service corporations. Only with correct accounts so that the investors may depend upon the accuracy of the financial statements furnished can public utilities finance themselves upon advantageous terms in competition with other avenues of investment."

The gist of the Commission's reasons for saying that it has made things so much better for everybody is that by requiring all the companies to have uniform bookkeeping methods, and to give conclusive evidence about the need of new securities, and what kind of financing they do, public utility financing has been standardized. Old slip-shod ways of doing things have been uncovered, and the companies have had to be more careful how they borrow money, how they spend it, and how they account for it. This has compelled managers to be more business-like. A financial statement from a public service corporation is rarely perfect even now, but the situation is very much improved.

"The primary cause of this is that prior to the promulgation by the Commission of its uniform systems of accounts little attention had been paid by many corporations to the proper reflection in their accounts and financial statements of their actual financial condition. Another contributing cause is that the inauguration of accounting systems by many of the corporations in conformity with the accounting orders of the Commission necessitated a decided change in their methods, and their employes can be only gradually trained and accustomed to them."

What it means to the proper handling of corporations, as well as to the interests of their security holders, to have some outside authority come in and overhaul the accounts is shown thus:

"Some of the corporations appeared to be in an unsatisfactory financial condition, and were very desirous of promptly securing from the Commission authority to pay off such current liabilities with an issue of bonds or stock, which securities after having been approved by the Commission would be more salable and place the credit of the issuing corporation in a better light before the investing public than would be the case if they continued to carry a large unfunded debt. Many of these current obligations represented money that had been borrowed ostensibly for capital purposes, but in reality were incurred in order to pay operating expenses, taxes, interest, or dividends. In other cases, by far the larger proportion had been incurred for capital purposes, but the books of the corporations had been kept in such a manner that it was not possible to prove this without a most elaborate investigation."

The experience of the Commission in security regulation has proved some rather unexpected things:

"Applications for permission to consolidate or merge, and form corporations controlled by holding companies, are constantly before the Commission. In this connection the Commission has had less difficulty in securing adequate service from corporations which are controlled or operated by interests of sufficient magnitude to warrant the employment of high-grade men as executives. Such interests also have a keen eye to the securing of additional business and development of the territory, which in many cases has caused them to adjust voluntarily their rates in order to secure it."

There are certain things in the financing of the holding companies that the Commission has been wary about, however:

"Their capitalization requires careful scrutiny, as it has long been the custom in the business world when bringing about changes and economies to issue sufficient securities to capitalize the future for a long period in advance. In cases of miscalculations where this is done, it results in receivership, unreasonable rates, and, what is most important, poor service."

It would seem to be that a possible outcome of the movement for regulation of security output by corporations will be enforced financial efficiency on the part of their officers, who will not be free to make any but good terms when they borrow money:

"Another problem that is receiving a great deal of attention from the Commission is the price at which securities which become liabilities of the issuing corporation shall be permitted to be sold. The Commission is required in every order to certify that the amount of securities to be issued is reasonably required for the purpose. This makes it necessary that the Commission shall ascertain that bonds and other obligations which are to be sold at a discount are authorized to be disposed of at a price which is not less than their reasonable market value at the time of authorization, inasmuch as the lower the price at which the securities are sold the larger the debt incurred for the purpose, with a resulting increased burden on the corporation."

Not even will short-sighted financing be possible:

"Orders made by the Commission usually contain a prohibition against pledging and hypothecating the securities authorized for loans without the specific approval of the Commission. Such pledging should not be on too disproportionate a basis, as otherwise, in the event of a sale under such hypothecation, the securities of the corporation might be issued without the corporation having received an adequate return. The money stringency and the falling off in the market for securities of all classes of corporations has been markedly noticeable to the Commission in the largely increased number of applications for authority to pledge securities as collateral for temporary financing. This practice on the part of public utilities of the State can of course be justified only upon the expectation that the conditions which appear to necessitate it will be temporary. In the event of these temporary loans falling due, and there again being no opportunity to sell securities on a reasonable basis with which to pay the same, it would necessitate a further pledging on probably a more disadvantageous basis."

It used to be thought that the regulation of the Commission was to be hostile to the interests of the companies and their security holders, and beneficial only to the general public in the way of reduced rates and improved service. For a long time far-sighted investment bankers have seen that in America, as in Europe, wise regulation would come to mean an assurance of investors. In New York, the Public Service Commission is trying to prove that faith well founded.

A State Railway Rushing Wilfully to Ruin*

By Francis A. Bonner,

Associate Director Bureau of Railway News and Statistics.

NOT far from directly beneath our feet on the nether side of Earth works a Government railway system exceeding slightly in length the Pere Marquette but falling short in width. It cost some $25,000 per mile to build, which is pretty cheap. On the other hand it is entirely narrow gauge; its steep grades run up hill and down dale like a trolley line; its tiny sleepers carry 45 to 60-pound rail and of ballast it boasts little. The maximum speed limit on some important portions is fifteen miles per hour. It is known as the Government Railways of Western Australia.

Ability or inability of one government of English stock to manage successfully a system of this size argues nothing, of course, for or against ability of another nation of kindred stock to operate successfully one of 90 times the mileage and 300 times the traffic, such as our own. Yet certain defects often are said to be inherent in public operations of this character. One is subservience to the labor vote as a matter of policy through advances in wages; the other subservience to the shipping and traveling vote as a matter of policy through undue cutting of rates. The trouble is probably at least as apt to be found where employes of the railways number 2,000,000 as where only 7,000 down in Western Australia; as likely where 90,000,000 people travel and ship $3,000,000,000 worth yearly as where 300,000 ship and travel $10,000,000 worth.

Experience in Public Ownership.

Few know the defects more to their sorrow than the Western Australian Railways. There, in that tiny system, rises the usual spectacle of a Government Railway Commissioner charged with operation for the people, recognizing and owning publicly to these selfsame evils of State ownership, pointing the danger and fighting in vain to induce his own Government to apply a remedy and check its headlong course toward financial ruin of its carriers. When two such policies come together—placation of the labor vote by greater payment of wages, placation of a larger vote by reducing rates and thus the wherewithal to make the payments—financial stability is likely to suffer from the impact. In Western Australia earnings for the fiscal year to June 30, 1913, for the first time in history exceeded £2,000,000 ($9,740,000). Again in gross of $746,000, however, was offset by a rise in expenses of $791,000 over the year before. Interest paid on debt rose on the average from 3.46 to 3.52 per cent. Surplus fell in two years from $1,090,000 to $122,000; the net return on capital was 5.32 to 3.56 per cent. The margin between that 3.52 per cent interest paid on debt and this 3.56 per cent net with which to pay it measured on June 30, 1913, the Western Australian Railway's distance from bankruptcy.

Government Errs on Side of Liberality.

Such a condition occasions little surprise after consideration of what this Government system has done to curry favor of its voting passengers. Requests for increased facilities have arisen so frequently and are pressed so strongly, the Department has erred so consistently on the side of liberality that the Commissioner of Railways cries loudly now for a halt. Passenger train mileage and reduced fares must be curtailed severely if ruin is to be avoided. So great has been the surplus of generosity, in fact, that nothing save a deficit is left for passenger traffic. Apportioning mixed train mileage and adding passenger train mileage the earnings from fares represented for the last year $1.05 per train mile. The cost of working was $1.29 per train mile. In working cost alone there was thus a loss of 24 cents per train mile exclusive of 43 cents chargeable for interest! Despite an increase of population of nearly 50 per cent in ten years and increased weight, capacity and standards of equipment the receipt per passenger train mile in 1912-13 was less than in 1902-03.

---

*Reprinted, by permission, from the Rand, McNally Bankers' Monthly.

Much of the loss, it is true, arises from a steady decline in length of journeys with consequent loss in the average receipt per journey. But it rests also upon the effect of excursion fares now applying to a larger number of journeys on a greater number of days and over greater areas, while in company with repeated rate concessions in deference to demands of the public for increased facilities, passenger train mileage has risen consistently, much of this addition being empty. "When these conditions are realized," says the Commissioner, "it may well be seen that the Department must rather look for openings to reduce passenger train mileage than to increase it, and for openings to increase fares rather than the reverse."

Unremunerative Freight Rates.

Unremunerative rates for freight service have arisen largely from a policy of "fostering infant industries" which the present management denounces as now useless to the industries and ruinous to the railway. Agricultrue and coal mines have been the chief beneficiaries. Since 1907 fertilizer has been carried at one-half cent per ton mile, a rate pronounced unparalleled in Australia (though by no means in the United States) for the purpose of encouraging the growing of wheat and development of new agricultural areas. The commodity, it was urged, would be carried in cars otherwise run empty to the country to return laden with wheat; the rate was necessary in order to induce more general use of fertilizers, increase the yield per acre and thus add to the railway revenue. This traffic has failed, however, to move as expected and the older farming districts now are pronounced well able to pay in full for the cost of service. Advances to the "miscellaneous" rate is demanded by the management, which would raise the charge to 2.4 cents per ton per mile.

Some Rates that Are Excessively Low.

Coal has been enjoying a rate of 30 cents per ton for the first five miles plus one cent per ton mile thereafter. Denouncement of such a rate as excessively low is interesting when we contrast the rate of .47 cent per ton mile on bituminous coal which is the average on United States railways. Yet for coal also an advance to the miscellaneous rate is demanded on the ground that this industry too is amply able now to stand upon its own feet.

As part of its policy, to make matters worse, the Government has steadily to ask competitive bids for its fuel and is paying excessively for the coal it buys from the very mines so subsidized by unprofitable rates. Had bids been asked, the Commissioner of Railways asserts, the Government roads might have saved 75 cents per ton on the 166,877 tons purchased, a tidy sum of above $125,000.

"As a matter of policy," says the Commissioner, "the various governments which from time to time since inception of the industry have dealt with the question have decided the price and distribution of orders and have abstained from submitting the contracts to competition.

"The difference of at least three shillings per ton between the price paid and the commercial value of the coal is in my opinion a bonus to the industry of some £266,700 per annum which should certainly not be made a charge on the Government Railways."

Governmental Roads Show Heavy Loss .

Solely because of these profitable rates on fertilizer and coal and excessive payments for fuel the Government railways last year lost some $371,000 which must come out of the taxpayer's pocket if the system is not to deteriorate. But to make matters still worse wage concessions cut ever larger slices from these depleted earnings. Nor has benefit ensued. "Improvement in conditions of employment," says the Commissioner, "has not put an end to the demands made upon the Department." In two years wages and salaries on these little railways have risen $1,110,000. Salaried employes have gained an average of some $35, wages staff some $73 annually per man; gains which suggest significantly, to say the least, the comparative numerical strength and organization of the workers affected. Why such expansion has been allowed to consume the meager substance of the railways is best told by the Commissioner himself:

"The year under review has been one of continual pressure from the staff generally for increased remuneration and emoluments and it is with regret I have to refer again to the evil of political influence in this connection.

Are Powerless to More Than Protest.

"If such matters are taken in hand by members of Parliament or of the Government, acquiescence is thereby given to the action of those who have approached them and the Railway Administration is powerless to do more than protest.

"Unless the practice referred to is put down with a strong hand in whose power it lies to put it down that portion of the Government Railways Act which was and is intended to remove the railways from political influence will become a dead letter. In any case it is a question of time alone when concessions so made to unreasonable demands from departmental employes are bound to result in revulsion of public opinion."

Response Is Inefficiency.

How has efficiency responded to these easy-won concessions?

"It is with regret," says the railway chief, "that I have observed no general increase of energy or effort corresponding with such a large increase of expenditure."

And why should he expect to? Where neither the quality nor quantity of service nor any resultant of supply and demand in the labor market but merely the strength of numbers behind an appeal activates excessive concessions of the kind at the hands of a subservient master, what relation exists between wages and efficiency? Where it is not the justice of labor's plea but solely the force of combined voices which encompasses the desired end, where economic law is discarded and an idea fostered that the Government is moved not by reason but by fear at the brandishing of organized labor's weapon of the strike, what relation remains in labor's mind betwixt zeal and compensation?

What Is Taking Place in France.

How uniform is the outcome! C. Colson, Councillor of State of France, writing of wage expansion on a State railway on the opposite side of the globe, the nationalized Western Railway of France, says:

"Now if by means of these sacrifices which have to be paid by the tax payers of the whole of France the administration of the State Railway has secured the devoted services and the gratitude of its employes, one might perhaps maintain that it had not paid too much for such a manifest advantage to itself and to its customers. But if there is one point about which there is a general agreement among all those who are in direct contact with the employes of the nationalized railway it is that these employes have never been less zealous or more fertile in complaints and recriminations."

Protest Made by John T. Short.

Surely the plight of Western Australia's State railways, with earnings about to fall beneath interest charges as a result of reductions in rates and increased expenditures for wages and material thus forced upon the Government as a matter of policy, is serious. One man, John T. Short, keen minded Commissioner of Railways, has fought in vain against the inevitable result, his solid advice to his Government as to the financial effects of its policy overruled repeatedly by political expediency. But the time for reckoning has arrived.

"I put the question now," says he, "as I claim to have done at all times in the past by reports to the Government and by my statutory reports to Parliament.

"Continuous pressure is exerted in opposite directions. Our customers are constant in urging upon the Department increased expense in the shape of train mileage and facilities and on the other hand demands for lower freights and reduced fares are equally constant. Labor organizations press for improved conditions of employment, shorter hours and other concessions. Rates of interest on capital are rising.

"As to where improvement is to be looked for it is difficult under existing conditions to say. By reduction of the passenger service or by improved conditions for the supply of coal, reduction of expenditures is impossible; and by reasonable increase of freights and fares, as effected in other parts of the Commonwealth under similar circumstances, improvement in the earning power is certainly practicable.

"Both alternatives are unpopular; but the results of our working for 1912-13 (crystalized in the fact that it cost £74 to earn £100) appear to me to necessitate their urgent consideration if railway earnings are to continue in the future to cover railway working expenditure and interest charges, and to provide a surplus for the treasury in addition as in the past years."

Aiding the Farmer

Mr. George D. Ogden, general freight agent of the Pennsylvania Railroad, delivered an interesting address before one of the recent sessions of the Farmers' Week at the New Jersey Experiment Station at New Brunswick on "How the Pennsylvania Railroad Helps the Farmer." He pointed out that by the stimulation of example as well as by helpful suggestions his company has undertaken to show how to cheapen the cost of production, raise the standard of the produce and increase the yield per acre.

He presented the following interesting table showing the low cost for transporting food sufficient for one meal for the average family of five persons:

Commodity.	Cost.	Freight.
Apples (5)	7.50c	⅛c
Beef (2 lbs.)	35.00c	1 c
Berries, fresh (2 qts.)	10.00c	1½c
Cabbage (1 head, 5 lbs.)	5.00c	¼c
Chicken (5 lbs.)	90.00c	1¼c
Milk (1 qt.)	9.00c	½c
Onions (10)	2.70c	¾c
Oysters (1 qt.)	22.00c	1-3c
Peaches, fresh (2 qts.)	10.00c	1 c
Potatoes (6)	3.75c	½c
Tomatoes, canned (1 can)	5.80c	1-3c
Tomatoes, fresh (2 qts.)	4.00c	½c
Turnips (6)	3.00c	2-3c

George D. Ogden.

Mr. Ogden pointed out the various plans the Pennsylvania Railroad has adopted to co-operate with farmers, and made a number of suggestions which he said would minimize the importance of obstacles, as follows:

"A shipper calls upon the agent at shipping point and orders a car to load for a market many miles distant.

"The vehicle of transportation is furnished; and here it might be well to remark that the cost of the car as compared with the cost of a farm wagon is in the ratio of SEVEN to ONE, or, to put it another way, seven wagons could be furnished for what it costs to supply a single freight car. The car aforementioned is loaded, shipping instructions furnished, and within a reasonable time the arranged service of the railroad company provides an engine and crew to move the car from the loading point to the first division or junction point, there to connect with another train, and so on by operating divisions or connecting railroads, until its final destination is reached.

"Several hundred employes are engaged in the work of so manipulating the trains, running on the freight tracks over a portion of the road, and again on the passenger tracks and back again to the freight tracks, in order to meet the requirements of an expedited service with the primary object in view of reaching destination at a fixed hour.

"Assuming the car reaches destination with reasonable promptness, in the case of perishable, the agent immediately calls the consignee on 'phone and notifies him of arrival, which is confirmed in writing, and if the contents of the car is of satisfactory grade, and the market in a receptive mood, the lading will be unloaded without delay. This seems reasonably easy of accomplishment, and it would be, if upon arrival at destination the consignee would promptly accept the shipment.

PERISHABLE FREIGHT DIFFICULTIES.

"It pays to grade at shipping point. This would seem to rob the carrier of tonnage, but, frankly, it would be very much better for all concerned if the rule were strictly observed, and, indeed, insisted upon at the shipping point. Perishable is rushed over the road at high rate of speed, and upon arrival at market found to have been loaded in an unsatisfactory condition, off grade, and carelessly packed, resulting in refusal by the consignee, compelling the delivering line to sell the property account of whom it may concern.

"It is most surprising that so little sensitiveness is shown to a factor which plays such an important part in appealing to buyers and affecting prices. I speak of careful selection in picking, the choice of containers, intelligent packing and proper stowing in cars. These four elements, if unobserved, counteract the naturally expected addition to prices and profits to be derived from the patient toil that is spent upon increasing the yield, improving the nature of the commodity, and the selection of markets, with many other details that go into the guardianship of the grower's interest. You must be surprised to learn the amount of freight charges alone that is involved in fruits and vegetables rejected by consignees. With the Southern railroads and the carriers touching the Eastern seaports, this amount approximates $75,000.

CAUSE OF CONGESTION AT TERMINALS.

"In large cities foodstuffs are generally received and delivered at a designated terminal. Deterioration and decay of perishable, rendering it unmarketable, very largely contributes to congestion, which has the effect at certain seasons of so crowding the railroad facilities that shipments which might be in prime condition and arrive when the yards are blocked with other perishable, are delayed in reaching the consignee, and in this respect the carrier is helpless in protecting its patrons against loss.

"Permit me here to refer to a burden upon railroads which the shipper cannot remedy in any marked degree, and we do not propose to ask or suggest the impossible. The height of the season for certain perishable commodities, such as strawberries, watermelons, cantaloupes, and potatoes in the larger producing territories, is for a comparatively brief period, thus compelling the railroads to undertake to provide maximum facilities and equipment to take care of the rush.

"No other branch of commercial activity would consider it prudent so to do. Of course, an overcrowded market is objectionable, with its consequent low values, but, as aforesaid, it is uncontrollable, at least under the present system of distribution. Does this not emphasize the importance of grading and proper packing at shipping points?

HELPING THE FARMER.

"The United States office of markets was established last May. The promulgation of market grades and standards, it is understood, will be one of the first matters taken up by that office.

"It is also proposed to look after transportation matters, particularly to see that suitable equipment is furnished, especially in the matter of refrigerator equipment.

"On November 30, 1913, a grand total of 4,780 refrigerator cars were available and owned by the Pennsylvania Railroad. It is now contemplated to add to this equipment not less than 1,000 refrigerator cars next year, unless some unforeseen situation should arise that would render impracticable providing the necessary money to pay for them.

EDUCATIONAL TRAINS AND EXHIBIT CARS.

"The first educational train was run in 1908, with an itinerary covering three days and a total of 22 stops.

"Lectures were delivered at each point of about forty-five minutes' duration, by representatives of the Agricultural Colleges or Experimental Stations.

"These educational trains have been run over almost every line in our system, comprising 5,311 miles east of Pittsburgh, and covering practically every aspect of the farm problem. The States traversed by these traveling colleges were New Jersey, Delaware, Maryland, Virginia and Pennsylvania.

EXPERIMENTAL FARM.

"In 1905 the Long Island Railroad Company, which, while operated independently, is a Pennsylvania Railroad line, purchased seventeen acres of land at Wading River, on Long Island, and an experimental farm was started.

"This farm was so successful that in 1906 a second one was purchased at Medford, on Long Island, consisting of seventy acres.

"In connection with this experimental farm work on the Long Island Railroad, a monthly paper is published by those in charge of the farm, entitled the *Long Island Agronomist*.

"It has been developed that quite a large number of settlers have been attracted to the line of the Long Island Railroad through the demonstration on the part of this company as to the possibilities of truck raising on small plots of a few acres each.

"Another effort in this direction was the purchase of an experimental or demonstration farm at Bacon, Del., on a portion of our road devoted almost entirely to agricultural pursuit.

"This is a fifty-acre tract and was intended to demonstrate what can be produced under what might be termed unfavorable farming conditions, and for the purpose a piece of land known to be rather unattractive from a farming viewpoint, having lain idle for a number of years without fertilization or cultivation, yet from this farm we have been able to produce almost every known variety of fruit and vegetable product, and, notwithstanding the farm was practically undeveloped in May, 1910, in the New York Land Show of 1912 an exhibit of agricultural products grown along lines of the Pennsylvania Railroad, a large number of which were from our own farm, took the first prize for the best railroad exhibit in the United States and Canada.

"The exhibit in the New York Land Show referred to, with many additions of worthy specimens received since that time, is now en route over the lines of the Pennsylvania Railroad East of Pittsburgh, Erie and Buffalo, in what is known as our Agricultural Exhibit Car. This car contains the most magnificent collection of fruits, grains and vegetables yet displayed by any railroad.

"Accompanying the agricultrual car is another car known as the Dairy Exhibit, devoted to the improvement in dairy methods, with resultant increase in the production of milk both as to quantity and quality.

"The aim of these cars, which are systematically covering the entire Pennsylvania System by making two-day stops, is to encourage the farming community to the development of the greatest possible activity in the production of food products.

"This effort of the Pennsylvania Railroad in agricultural development, extending and broadening its point of view from the farmers' train with its limited effort both as to the time at each stop, as well as the shorter period on the road, up to the exhibit cars which traverse the line thoroughly and give the farmer ample time for discussion and thought, is the latest word in coöperative effort on the part of the railroad and the farming community."

Transportation of Food Stuffs

ADDRESS BY FRANK ANDREWS, OF THE DEPARTMENT OF AGRICULTURE, AT THE MEETING OF THE PHILADELPHIA PRODUCE EXCHANGE, PHILADELPHIA, PA., JANUARY 20, 1914.

SEVERAL years ago a railroad station agent in Florida purchased some potatoes as a business venture and sold them in the North. The transaction was profitable enough to encourage him to plant potatoes the following year. Again he was reasonably successful; and the third year he planted still more, but found to his dismay that many of his neighbors also had planted. He wrote to his commission merchant telling him a tale of woe. Seven hundred acres were planted to potatoes near his station. What was he to do about it? The commission merchant wrote back not to worry; to harvest the crop and ship it. The merchant was one who sold Florida potatoes to many markets, some as far north as Montreal and some as far west as Seattle. This is but one of thousands of illustrations of the wide distribution of what we may call "produce," that is, vegetables, fruit, butter, eggs, and poultry. Each region of large production for a given crop has open to it hundreds of large markets. There are some 200 markets in the United States, any one of which will purchase at one time a carload of such highly perishable produce as strawberries or peaches, and of course there are still more markets where potatoes can be sold by the carload.

Eggs produced in Kansas are sold in cities as far east as Boston, New York and Philadelphia; as far south as New Orleans, Houston and Galveston, and as far west as San Francisco and other cities on the Pacific Coast. Poultry from Tennessee and from Texas also finds its way throughout a large part of the United States. The peaches of Georgia reach not only the Eastern markets, but are shipped westward even as far as the Missouri River where they compete with the product of Arkansas. For each producing region there is a large number of markets to which lines of distribution radiate; so each large market is connected with many producing regions. Kansas City, for instance, receives its lettuce not only from nearby market gardens, but also from Colorado, from New York, from Florida, Texas, Louisiana and California. In New York, and probably Philadelphia also, cantaloupes from the Imperial Valley of California have been sold on the same day with those from Georgia and Florida; and, later in the season, the cantaloupes from Maryland and from New Jersey have been in the same market with those from Colorada. Produce is brought from foreign countries also. Within the past year Philadelphia has imported eggs from Roumania, and they may soon be brought here from China. Some of the butter sold in this city recently came all the way from Omsk, in Asiatic Russia.

Among the interesting things to read on the subject of transportation of food stuffs are the marks on packages of produce at commission merchants. A walk along South Front street or Dock street, or parts of Chestnut will afford much of interest. A barrel of apples from Albion, New York, may have for its neighbor a barrel from Winchester, Va., boxes from the Yakima Valley of Washington, or Hood River, Oregon; near them possibly crates of onions from San Antonio, Texas, boxes of oranges from Redlands, California; and so on down the list. What may be seen on Dock street of this city is a duplicate of what may be seen in many produce districts of other cities. The markets all tell the same story, as to the wide range of the sources of food supply, and, on the other hand, the wide range of markets from which shippers may choose.

Among the classes of problems concerning the transportation of food stuffs, two classes may be mentioned. One class of problems has for its object the lowering of cost of transportation. Grain is a commodity which requires low costs, or it is not commercially possible to carry it. The success of the efforts to reduce freight rates on grain is illustrated by the fact that the average cost of carrying wheat from Oregon and Washington to England, a voyage of some 18,000 miles, is about 16 or 17 cents per bushel; and it is by no means unusual that the freight rate on wheat from Duluth to Buffalo, some 1,100 miles, is one cent per bushel.

A second class of problems affecting the transportation of food stuffs has for its object the improvement of the service. The commodities which this class of problems affect include the different kinds of "produce," especially those that are valuable enough to pay for good freight service. One of the elements of this high class service is refrigeration. Other elements are speed, rgularity, and what may be termed "flexibility" of service.

The importance of speed in transporting perishable products is evident. The longer they are on the way the more they are apt to deteriorate. Fast freight trains are made up usually of a small number of cars. Twenty-five cars is not an uncommon number for a train of peaches, while 40 is not an uncommon number for ordinary freight, except in hilly country. The average speed of some high-class freight trains amounts to about 400 miles in 24 hours. This includes stops at terminals, for the purpose of icing, changing crews, etc.

Regularity of service also is important for perishable freight. It is necessary for certain classes of produce to reach market by a certain hour. If the produce is late it may be necessary to hold it until the following day, or if a Sunday or holiday intervenes, it may be held over two days and with considerable loss. It may be said that while regularity is not perfect and while trains are occasionally late, their regularity is established to such an extent that business transactions are based upon it.

By flexibility of service is here meant the facility for changing the route of a car while it is on the way. This is also called diversion in transit. For instance, a car of oranges shipped from Redlands, California, and consigned to New York may have been on the road for a day or two when the destination is ordered to be changed and the car sent to Galveston, or possibly to St. Louis, or Duluth, or somewhere else. The purpose of this diversion is to avoid selling in a glutted market. The shipper from his news of supply and price judges which market is the most desirable and orders the car sent accordingly. In order to find where a car is he may inquire of a railroad agent. The progress of cars in fast freight service is reported as they pass certain stations along the route; and these telegraphic reports inform the shippers where the cars are.

Among the results of his highly organized system of transportation, two may be mentioned: The season in which some products are on the market has been greatly extended. Refrigeration, as well as fast freight service, has aided this extension of seasons. In many cities cantaloupes are sold for five months in the year; strawberries may be bought from December until late the following summer; while lettuce, string beans, and similar products are in the market twelve months of the year. Another result of this widely extended system is that the consumer suffers less than formerly when a crop fails in a given locality. The strawberry crop of a certain region may fail, but the general supply, although reduced, will not be cut off.

Superheating Developments in England

(From Our London Correspondent.)

THERE is continued development in England in the use of superheating in locomotion. The three principal styles of superheated steam used, the Schmidt, Swindon and the Robinson, are pretty well known by this time. One thing that British locomotive engineers are keeping their eyes fixed upon is that one result of the use of superheated steam is the possibility of using larger cylinders with the same boilers. Advantage may be taken of this fact, if it is unnecessary to increase the tractive effort, to employ a large cylinder and reduce the boiler pressure; and a still greater advantage, which up to the present has perhaps hardly been fully developed, is the opportunity of building locomotives which shall be more powerful at high speeds without increasing the weight more than is entailed by the superheater itself. This additional weight is usually about two tons.

The oil used in superheater engines is usually a pure mineral oil, or a blend containing up to five per cent of fixed oil. It should be free from suspended matter and perfectly neutral. At ordinary temperatures the viscosity is generally so high that the oil will scarcely flow, and though it thins rapidly on heating the time of efflux of 55 c.c. from Redwood's viscometer should not be less than 160 seconds at 212 degrees F. The flashing point should not be lower than 500 degrees F. (closed test) . It is desirable that the oil should have a certain degree of volatility so that any that may become deposited on the walls of the cylinders or in the valves may be vaporized and pass away with the exahust steam, instead of carbonizing. On the other hand, it must not be too volatile, else it would evaporate without lubricating. Thus the range of the grade of oil is a comparatively narrow one, and experience shows that even oils which give good results leave a carbon deposit, though if examination and cleaning are done at intervals of 20,000 to 25,000 miles no trouble is likely to occur with a suitable oil.

The usual custom is to employ mechanical lubricators. On the Midland Railway an eight-feed pump is used, four connections delivering to the piston valves, two to the piston rod, packings, and two to the tail-rod bushes, the last being covered with a dummy gland. From 1½ to 1¾ pounds of oil is used per 100 miles run. The pumps are preferably double acting, so that the supply of oil might be continuous, as any long interval between the feeds might cause trouble.

On the Midland Railway sufficient experience has not yet been obtained to enable any actual figures of costs of maintenance to be given, but everything tends to show that they would not in any case exceed those of saturated steam engines, in spite of the fact that the engines to which superheating has been applied have been worked much harder than when they used saturated steam. The boilers of superheater engines show considerably less wear than is usually the case with locomotives engaged on similar work and using saturated steam; hence they would run longer without "shopping" and are out of service a proportionately shorter time. No doubt the extra equipment required on a superheater locomotive tends to increase the costs of maintenance, but the author believes the increase is more than compensated for by the saving in boiler repairs.

Practically the only extra attention required by superheater locomotives in service is that involved in keeping clean the large tubes which contain the elements. It has been found that the tubes can be kept quite clean by using steam between 100 pounds and 80 pounds per square inch taken from the boiler as the pressure is falling. The frequency of the cleaning depends on the quality of the coal used and the manner in which the engine is worked, but under ordinary conditions satisfactory results are obtained if the tubes are cleaned after about every 300 miles of running.

In making tests on the Midland Railway the comparisons of coal economy are based on the consumption per ton mile. The coal is weighed on and off the tender and the water measured. The weight of the train is taken on the actual weight of the coaches, plus 10 per cent for passengers and luggage, and to the weight of the engine loaded is added the weight of the tender with two thirds of the maximum load of coal and water. The usual heat of the steam on the Midland superheater engines is 600 degrees to 630 degrees F., or 230 degrees to 260 degrees superheat. Occasionally temperatures of 700 degrees F. are reached without trouble being experienced though it is doubtful whether existing conditions will permit them to be used continuously. In one case where a bank having a gradient of one in 50 and a length of eight miles was encountered the temperature of the steam regularly rose to 700 degrees, but fell considerably on the run down the other side.

In one series of tests, consisting of six double trips between London and Leeds (198 miles) for each engine, the two engines were of the 990 class (4-4-0), one having been rebuilt with a superheater. The latter engine showed a saving of 23 per cent of coal and 22 per cent of water over the former on the ton-mile basis. After it had run 62,000 miles without "shopping" it was found that the coal consumption had increased only 1.5 per cent and the water consumption 2.8 per cent per ton mile. In similar tests carried out with the same engine and a three-cylinder compound, the consumption of coal was 15 per cent and of water 17.5 per cent less per ton mile than with the compound.

Two engines have been rebuilt exactly alike, except that one has been fitted with a superheater, while the other uses saturated steam, and tests have been made with them between London and Derby (128 miles). The superheater engine shows a saving of 30 per cent in coal and 34 per cent in water over the other. Probably the reason why these figures indicate a larger comparative saving over those previously quoted is that while the superheater engine is running well within its capacity the other has to be worked hard to run the trip.

Recently it was decided to superheat the steam supplied to the high pressure cylinder of one of the Midland's three-cylinder compound engines. Some doubt is felt as to the effect of the continued high temperature in the cylinder, but after three months' running no disadvantages have revealed themselves, and the engine has run perfectly satisfactorily. Tests against a sister engine using saturated steam show a saving of 25.9 per cent in coal and 22.3 per cent in water. The average coal consumption on five double trips between London and Leeds was 0.0679 pounds for the superheater engine and 0.0916 pounds for the other, the corresponding figures for the water being 0.619 pounds and 0,797 pounds.

Two 0-6-0 engines employed for coal traffic have been equipped with superheaters, and tests were made on six double trips between Toton and Brent, 126¾ miles apart. In every case the loaded train from Toton to Brent consisted of 45 wagons and a van, while the return train was made up of 80 empty wagons and a van. The loaded trains were weighed vehicle by vehicle on a weighing machine, their average gross weight being 700.7 tons in the case of the superheater locomotive and 712.1 tons in the case of the other. The average weight of the return empty trains was slightly over 573 tons in both cases. With superheated steam there was a saving with the loaded trains of 14.3 per cent in coal and 20.4 per cent in water, and with the empty trains of 18 per cent in coal and 24.8 per cent in water. For the loaded trains the average coal and water consumption was 0.0785 pound and 0.727 pound per ton mile with saturated steam and 0.0673 pound and 0.579 pound with superheated steam, while for the empty train the corresponding figures were 0.1234 pound and 0.978 pound with saturated steam and 0.1012 pound and 0.735 pound with superheated steam. This marked difference was partly due to the empty trains being worked at a somewhat higher booked speed, but the undoubtedly higher resistance per ton of a light long train over a heavy short one is accountable for a very considerable portion of the variation.

BOOK REVIEWS.

American Red Cross Abridged Text-Book on First Aid.—Railroad Edition, published by P. Blakiston Son Company, Philadelphia.

This interesting publication of 150 pages, is by Major Charles Lynch, of the Medical Corps of the United States Army, and is prepared and endorsed by the American Red Cross Society. It is profusely illustrated, graphically portraying the steps to be taken in rendering first aid to the injured, and the various injuries generally sustained in industrial occupations are classified and dealt with in well defined groups in separate chapters. The last chapter deals exclusively with railroad and shop first aid, and besides briefly reviewing the inception and growth of the safety movement on the railroads of the United States, contains a large number of "don'ts" so arranged as to apply to the various departments of this service. As a whole, the book constitutes a valuable addition to the greater safety movement.

Financial

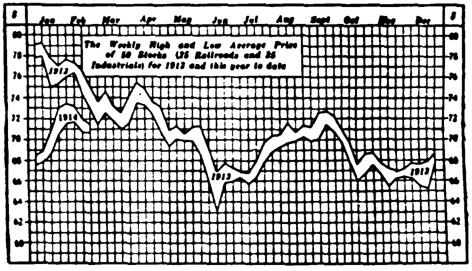
An Improved Outlook.

THE first two months of the calendar year have witnessed some improvement in the outlook both from a business and financial point of view. While it is too soon as yet to draw any definite conclusions from these improvements, they are, nevertheless, of such a character as will prove encouraging.

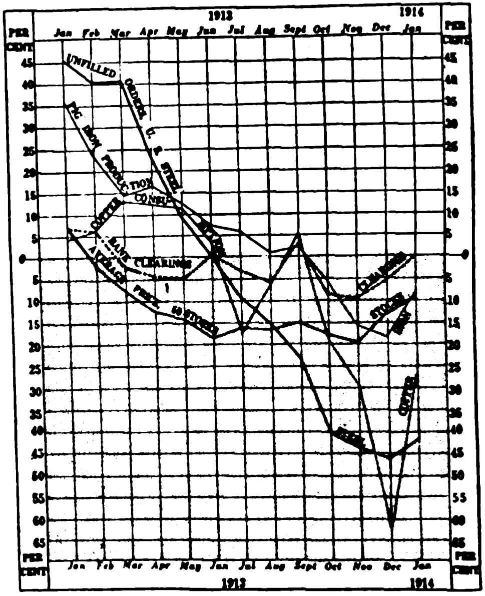
The following diagram which appeared in the New York *Times Annalist* of February 23d, graphically portrays the upward movement which has recently occurred in bank clearings, the average prices of representative stocks, copper consumption, pig iron production and the unfilled orders of the United States Steel Corporation. All of these important indices appear to have united in emphasizinig the fact that more recent developments have had a stimulating effect both upon business and financial markets.

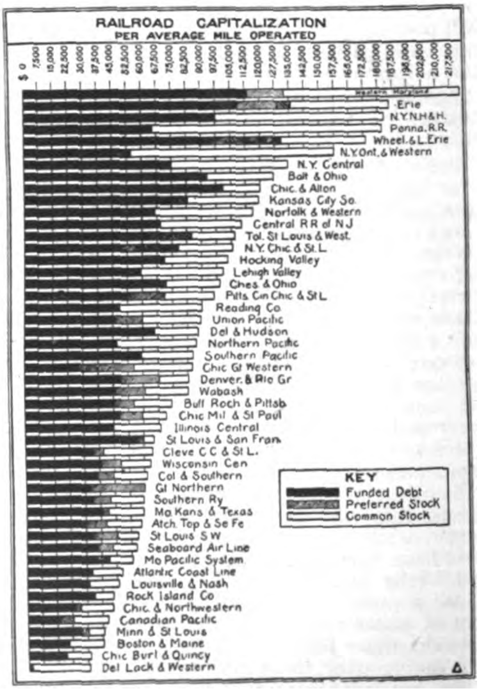
Two reasons stand out prominently as largely influential in the partial restoration of confidence as evidenced by the upward trend referred to. First, the apparently friendly attitude of President Wilson towards all business activities of a legitimate character and his publicly expressed desire to interfere just as little as possible in such activities, and second, the growing conviction on the part of financial and business interests that the carriers have practically won their case before the Interstate Commerce Commission for an increase of five per cent in their freight rates. In fact, the belief has been steadily growing and at the present time is nation-wide in its effect, that no single development will have such a marked effect upon the return of business confidence and its resultant prosperity, than the granting by regulative authorities of the petition of the Eastern roads to increase their freight rates. The *Annalist* of the same date also contains an interesting diagram, reproduced herewith, showing the course of the security market as represented by combined averages of twenty-five railroad and twenty-five industrial stocks for the year 1913 and for the first month and a half of 1914. As indicated by these figures, the current year has witnessed a distinct upward trend with the exception of the recent period affected by the decision of the Interstate Commerce Commission to again postpone until September the tariffs which have been filed in the advance rate cases. The force of this influence, however, has been largely dissipated by the subsequent statement of the Commission to the effect that this suspension was largely a matter of form and that it was the desire of the Commission to complete this case and to render a decision at the earliest possible date. It is now generally believed that a decision will be reached in the course of the next two or three months. Whether the railways will receive the horizontal increase of five per cent asked for or whether the Commission will attempt to make its own readjustments, is a matter at the present time of pure

The Course of the Market

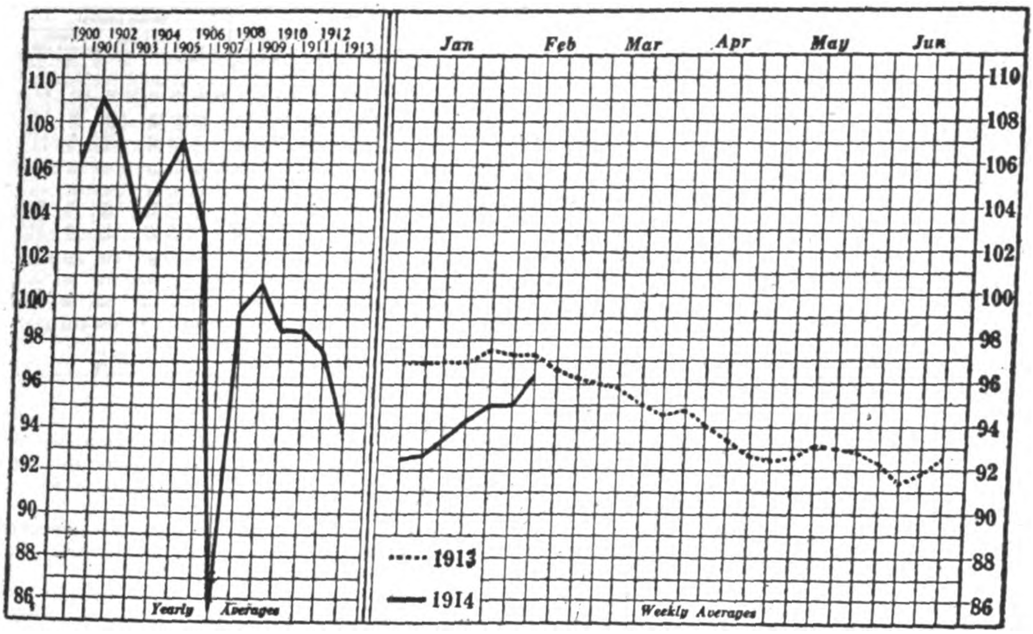


The Upturn





Curve of the Basic Price of Bonds



speculation. One thing is certain, however, that unless the railroads are permitted to appreciably increase their net incomes, the detrimental effect of such a restrictive policy will be felt by every industry in the country.

The Mexican situation still remains a disturbing factor and recent developments have offered little or no indication as to what attitude this country must ultimately assume. President Wilson is still playing a waiting policy with the evident hope that conditions will so improve as to relieve the United States of the responsibility of armed intervention.

A favorable development in the bond situation during February rested in the fact that a large portion of the new financing was done with long termed bonds rather than with short term notes as has been so general of recent years. While the Southern Railway and the Erie each issued an amount of three-year notes, this was evidently due to the inability of these companies to prepare in time the large blanket mortgages with which they intended to do most of their financing in the future. The Rock Island is also reported to be contemplating a short term issue, but owing to the local problems involved, this does not necessarily indicate the general trend of the market.

Recent orders for railroad freight cars present an indication of business revival that is interesting and important. The inquiries and contracts which have appeared in the last few days indicate a distinct revival in this branch of the railway supply industry which adds to the promises of 1914. In addition, the United States Steel Corporation report of unfilled orders on January 31st, show a total of 4,613,680 tons. This is an increase of 331,000 tons during the month of January and is a strong evidence of a reviving activity in the steel trade. While this increase is undoubtedly largely due to the fact that during a considerable portion of the month, the mills of the Steel Company were at a low rate of production, nevertheless the evidence of increasing demand is beyond contradiction.

Railway Revenues and Expenses for December and the Calendar Year.

THE Bureau of Railway Economics has issued its summary of revenues and expenses of steam roads in the United States for the month of December and for the calendar year 1913. Returns for December reduced to a per mile of line basis, and compared with the net returns for December, 1912, show a decrease in total operating revenues per mile of 5.2 per cent and an increase in operating expenses per mile of 0.1 per cent. Net operating revenue per mile was less by $61.00 or 16.9 per cent than for December, 1912, while that for December, 1912, was 10.4 per cent greater than for December, 1911.

For the calendar year 1913, total operating revenues per mile increased 3.7 per cent, and operating expenses per mile 7.3 per cent. Net operating revenue per mile decreased $183.00 or 4.4 per cent, while that for the calendar year 1912, was greater than for the calendar year 1911 by 5.1 per cent. Operating income per mile decreased $239.00 or 6.6 per cent.

The railways whose returns are included in this summary operate 224,990 miles of line, or about ninety per cent of the steam railway mileage in the United States. The operating revenues for the month of December, 1913, amounted to $247,398,764. This includes revenues from freight and passenger traffic, from carrying mail and express, and from miscellaneous sources connected with rail operation. Compared with December, 1912, the total operating revenues show a decrease of $11,576,925. The total operating revenues per mile of line averaged $1,100 in December, 1913, and $1,160 in December, 1912, a

* Less than one dollar. d Decrease. def Deficit.

decrease of $60 or 5.2 per cent. Freight revenue per mile decreased 7.3 per cent, while passenger revenue per mile decreased 0.8 per cent.

Operating expenses, which include all the costs of maintaining track and equipment, operating trains, securing traffic, and of administration, amounted to $180,086,863. This was $1,522,631 more than for December, 1912. These operating expenses per mile of line averaged $800 in December, 1913 and $799 in December, 1912, an increase of $1 per mile, or 0.1 per cent.

Net operating revenue, that is, total operating revenues less operating expenses, amounted to $67,311,901. This was $13,099,556 less than for December, 1912. Net operating revenue per mile of line averaged $299 in December, 1913, and $360 in December, 1912, a decrease of $61 per mile, or 16.9 per cent.

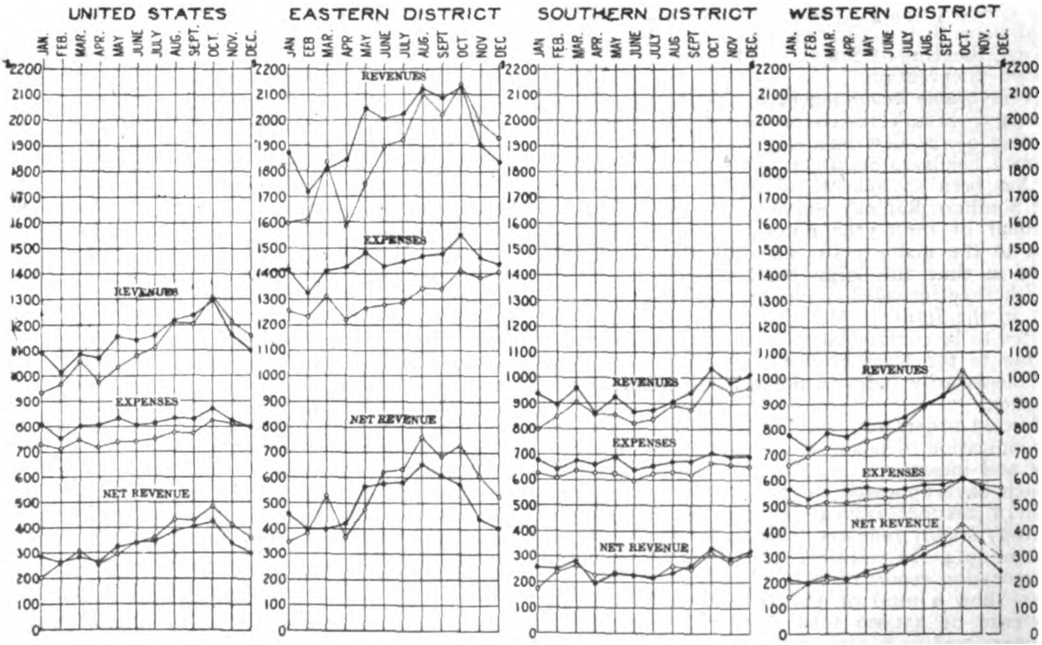
Taxes for the month of December amounted to $11,320,885 or $50 per mile, an increase of 7.2 per cent over December, 1912.

Operating income, which is net revenue from rail and outside operations, less taxes, averaged $248 per mile of line, and in December, 1912, $314, thus decreasing $66, or 21.1 per cent. Operating income from each mile of line for each day in December averaged $7.99 and for December, 1912, $10.12. Operating income is that pro-

MONTHLY REVENUES AND EXPENSES PER MILE OF LINE

ROADS HAVING ANNUAL OPERATING REVENUES OF $1,000,000 OR OVER

CALENDAR YEAR
1912 •
1913 •



The points on the vertical lines are of significance only in showing the condition for the particular month. The lines connecting the points assist in tracing the change from month to month but do not indicate the trend during the month, nor are they cumulative for the period.

portion of their receipts which remains available to the railways for rentals, interest on bonds, appropriations for betterments, improvements, new construction and for dividends.

The operating ratio for December, that is, the per cent of total operating revenues absorbed in operating expenses, was 72.8 per cent, which is comparable with 70.8 per cent in November, 1913, and 69.0 per cent in December, 1912.

Compilation of December returns makes possible a summary of earnings and expenses for railways having total operating revenues of $1,000,000 and over for the calendar year 1913. These lines operate about ninety per cent of the steam railway mileage of the United States.

Total operating revenues for 1913 amounted to $3,075,112,243. This is equivalent to an increase over the previous year of $485, or 3.7 per cent, per mile of line. Freight revenue per mile increased 3.4 per cent and passenger revenue per mile 4.2 per cent. Operating expenses amounted to $2,189,563,930, which was an increase of $668 per mile, or 7.3 per cent, over the calendar year 1912. Net operating revenue amounted to $885,548,313 representing a decrease of $183 per mile, or 4.4 per cent as compared with 1912. Operating income per mile of line decreased $239, or 6.6 per cent.

The railways of the Eastern District show a decrease in net operating revenue per mile of 9.1 per cent, railways of the Southern District an increase of 4.3 per cent, and the railways of the Western District a decrease of 2.5 per cent. All three districts show increases in total operating revenues per mile and in operating expenses per mile but in the Eastern and Western districts these increased operating expenses more than balanced the increases in revenues. Taxes per mile increased 7.7 per cent in the East, 7.8 per cent in the South, and 8.9 per cent in the West. Operating income per mile decreased 12.6 per cent in the Eastern District, increased 4.0 per cent in the Southern District and decreased 4.0 per cent in the Western District.

Operation

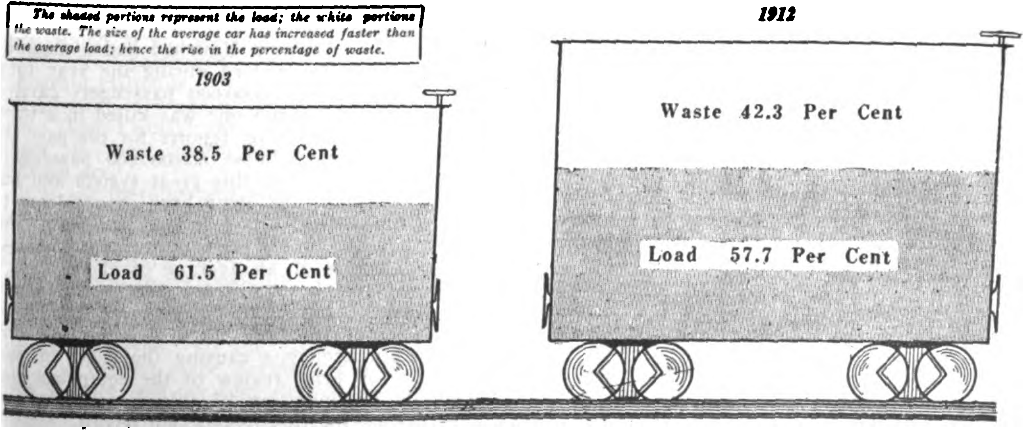
Comparison Between the Capacity and Load of Freight Cars.

RAILROAD officials have for a number of years recognized the fact that the load has not kept apace with the growth in the capacity of freight cars. Various means have been attempted in order to overcome this disadvantage but no success of a general character has, as yet, been obtained. It is a recognized fact that in perhaps no other single way could the railways inject so much economy into the operation of their lines than by the more general procurement of fuller carloads, but the various inducements which have so far been offered, have failed to accomplish the desired results.

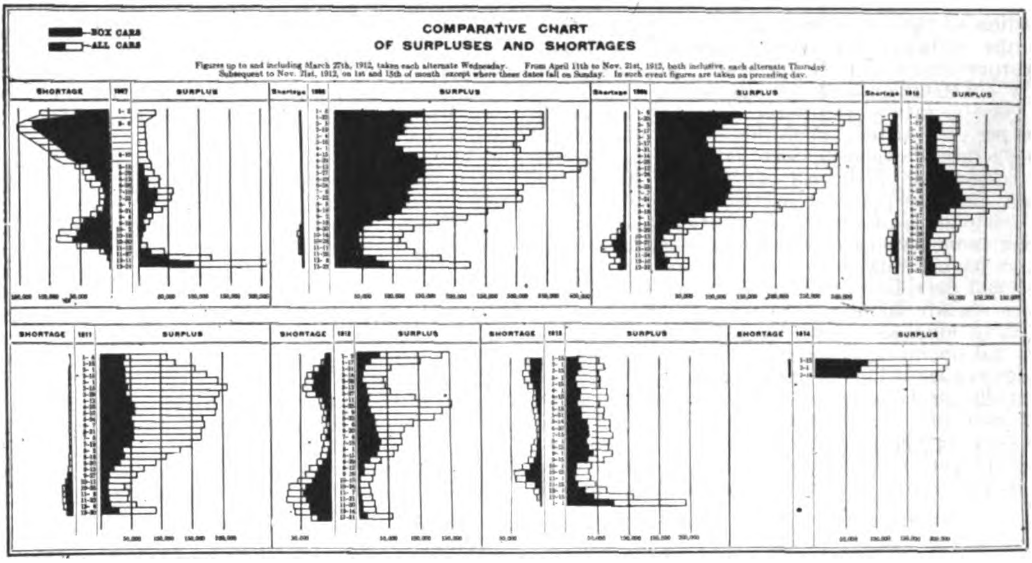
This question is interestingly discussed in the New York "Times Annalist" of February 16th, from which the accompanying diagrams were procured. These show that while the waste in 1903 was but 38.5 per cent of the full capacity of each carload carried, it had risen in 1912 to 42.3 per cent in spite of the fact that the average load per freight car was many tons heavier in the former than in the latter year. Furthermore, it is pointed out that as much as forty per cent of the total tonnage moved by rail in Eastern territory consists of coal and that in coal traffic loaded equipment runs one hundred per cent full. From this it is estimated that the average amount of wasted freight car capacity in the loaded movement of cars engaged in other than coal traffic must be instead of 42.3 per cent, in the neighborhood of 67 per cent. When in addition to this, it is appreciated that in thousands of instances, railroads are constantly hauling each day empty freight cars long distances, it is readily perceived what an enormous amount of space in freight cars is constantly going to waste for which as yet, no adequate or effective provision has been made for its utilization. To quote from the article in question:

"Though the percentage of waste in equipment has been increasing, as shown by such facts as that the capacity of equipment has increased faster than the carload and that the tractive power of locomotives has increased faster than the train load, yet the quantity of serv-

The Average Eastern Freight Car and Its Average Load



The shaded portions represent the load; the white portions the waste. The size of the average car has increased faster than the average load; hence the rise in the percentage of waste.



ice performed by the railroads has increased very much faster than the population. Let the measure of that service be expressed in ton miles.

"From 1903 to 1912 the population of the Eastern railroad territory increased seventeen per cent.

"In the same time the ton miles of transportation produced by the forty-nine railroads increased 53 per cent.

"That is to say, in 1903 each unit of population statistically consumed 2.582 ton miles of transportation, and in 1912, 3.383 ton miles, an increase of 31 per cent.

"There are sundry qualifications. The aggregate of ton miles contains the movement of freight for export. An increase in the average distance each ton of freight was hauled would increase the aggregate of ton miles of transportation produced. But the export traffic in relation to the whole is very small, and the haul lengthens, if at all, very slowly, so that the conclusion is irresistible that the per capita consumption of transportation has increased faster than anything else.

"That leads one to consider service.

"The statistical evidence of increasing waste, especially in the rising ratio of vacancy in equipment, is only in some measure a reflection upon railroad efficiency. For the rest it is a consequence of an increased demand on the part of the public for service, stimulated and encouraged, unfortunately, by the railroad traffic managers, who say that service is the only thing in which they can still compete. The competition in rates is a thing of the past. The competition in service has led to such absurd waste as that represented by two or three tons of 'dead freight,' like brooms and chemicals and castings, moving in a 40-ton car at a high rate of speed on schedules as rigidly maintained as those in passenger train service; or by a car that goes every day to a certain town, whether it carries 200 pounds or three tons, because that town demands the service. When the car is opened the freight is found to be largely of an imperishable sort, which might as well have waited for a carload. The unnecessary waste in service has more than offset the improvement in car loading which has been made possible by the integration of certain industries into very large units. The railroads evidently have lost control of service. Having once given it they cannot withhold it, no matter how wasteful it becomes. The shippers insist. They do but dimly see that in the end they have to pay for it—probably in the form of higher rates. There is only so much freight to be moved and so much revenue to be gained by all the railroads for moving it. To move it in larger loads and at lower speeds would greatly reduce their costs and thereby increase their profits."

The Car Situation.

THE American Railway Association has issued its statement of car surpluses and shortages as to February 14, 1914. This shows the total surplus of cars on that date to be 199,385 as compared with 211,960 on February 1, 1914, and 52,700 on February 15, 1913. The total shortages on the 14th of last month amounted to 2,333 cars, compared with 2,282 on February 1st, and 30,517 on February 15, 1913. The following diagram graphically portrays the surpluses and shortages by semi-monthly periods for the past seven years.

Safety on the Pennsylvania.

THE Pennsylvania Railroad had a magnificent safety record during the year 1913, as out of 111,000,000 passengers carried during that period not one was killed in a train accident. Furthermore, reports for the past six years show that almost 600,000,000 passengers have been carried by this great system and but sixteen of them lost their lives in accidents to trains, nine being killed in one accident. Put in another way, in six years out of approximately 5,000,000 trains or an average of about 2,280 a day, only five have suffered wrecks which cost the death of any of the passengers carried on them. Three of these years were entirely free from train accidents causing the death of passengers. A brief review of the equipment and methods of operation of this system discloses the reasons for this remarkable record.

The Pennsylvania at the present time is for the most part, a multiple track system running through the most congested districts in the United States. The roadbed is of the highest standard, the main line being laid entirely with stone ballast. During the past year the company paid $2,095 per mile to maintain 12,766 miles of track. The rail of main lines is of 100 pounds section and no lighter rail is bought. The Pennsylvania Railroad believes that from the safety standpoint nothing that it has done has been of more far reaching importance than the investigations it has made in the development of rail sections and specifications. While a rail is being rolled, it is carefully inspected by a representative of the Company and one rail out of every heat rolled, is tested for the interior fabric of the steel. The company keeps a complete history of every rail purchased and is thus able to classify failures and more readily guard against repetition. Much progress was made last year in increasing the number of cross ties per 33-ft. rail for the purpose of giving the track more strength and making it safer. On main lines twenty ties per rail are now being installed with eighteen as the standard on the branch lines.

All bridges are inspected monthly by division bridge inspectors and the division engineer together with the master carpenter are under orders to inspect them semi-annually.

In addition to the above inspection, there is a further inspection made by three men of practical and theoretical experience, whose duty it is to make detailed inspections of all bridges on the Pennsylvania Railroad. These men have had experience in both bridge designing and construction.

In connection with the employment of block signals, it is of interest to note that since January 1, 1913, all passenger traffic on main lines and branches, or in other words, one hundred per cent of the Pennsylvania's passenger traffic, has been handled under absolute or automatic block signal system. Forty per cent of all freight and passenger mileage is handled under automatic signals.

During the last ten years, 430 grade crossings have been eliminated at a cost of $27,742,433; during 1913 there were 55 grade crossings in process of removal. It is the policy of the Company to undertake no new work on which there will be grade crossings. The Pennsylvania Railroad has on its lines 1,613 all-steel passenger cars, which includes about fifty per cent of the entire steel passenger carrying equipment on the steam railroads of the country. In addition, 378 all-steel cars are in the course of construction. The Pennsylvania Railroad is operated under the most approved rules known to the railroad art.

It is the thoroughness with which these rules are carried out, however, which supplies the criterion by which operation should be judged. The divisional system of operation is used in an effort to localize responsibility. Division superintendents scrutinize carefully the action of all men under them and efficiency tests are frequently employed. Of the 4,478,135 such tests and observations made during the year ending June 30, 1913, 99.8 per cent showed perfect compliance with all rules.

Greater Safety Developments.

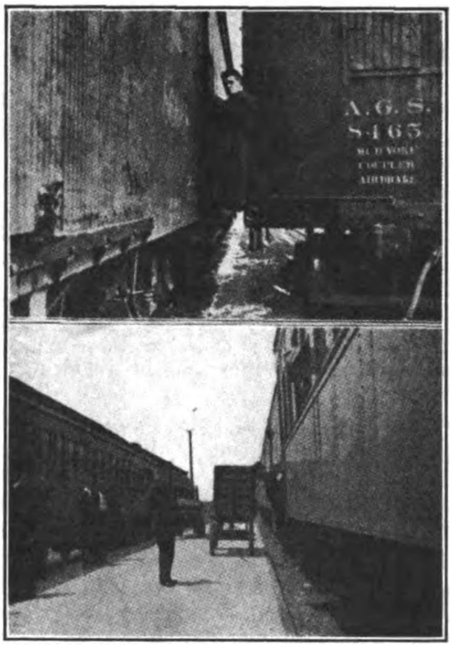
THE latest monthly safety bulletin of the San Pedro, Los Angeles and Salt Lake Railway Company, shows that a fifty per cent reduction in employes' personal injuries was effected in January. The record for the past three months was as follows:

Personal injuries to employes in November 75, in December 68 and in January 34. The 34 injuries in January, however, were only about half of what might be termed of a serious character, although attention is called to the fact that the seriousness of the injury is no good guide to the importance of the accident. The bulletin enumerates the various causes of these accidents, thus indicating how they may be avoided in the future.

IN an article appearing in the February issue of the Santa Fe Magazine, calling attention to the fact that the neglect of the safety habit does not pay, a number of forcible illustrations are presented showing the actual conditions under which various accidents have occurred, as, for example, one which shows a man carrying a pail of drinking water for a gang of workmen, attempting to board a rapidly moving switch engine. He miscalculated in some way and was killed. In other words, his laziness cost him his life.

Another illustration which shows a bumping post and drawhead, but which in itself does not disclose its death dealing qualities, calls attention to the fact that an employe instead of walking three feet out of his way or around the bumping post, took a chance and went between the post and the drawhead car and was killed. Had he had the safety habit, this would not have occurred, but he did not, and the cars being moved at that instant he was crushed to death.

THE Chicago and North Western Railway has instituted an innovation in greater safety work by the frequent publication of what it terms its safety bulletins in which attention is called by text and illustration, to the manner in which accidents occur from month to month on the lines of its system. Two pictures are produced herewith from its safety bulletin No. 4, published January 10th, which give an indication of the character of the service rendered. In the first, a switchman is shown riding on the steps of a car. He had noticed that the car to his right was close, but had measured the distance with his eye and thought he could clear it, the result was, he was knocked off and killed. A second illustration shows a baggage truck too close to a moving train. The conductor of this train was standing on the steps of one of the coaches looking down to see if anything was wrong with the tracks, when he was struck on the head by a trunk projecting from this truck and knocked off the car. Other illustrations of a similar character included in this bulletin have had their practical application and indicate in a most interesting and striking manner, how the lack of enforcement of the company's rules often leads to serious injuries or death.



The above illustrations show how two accidents occurred recently on the Chicago and North Western Railway. In one instance, a man misjudged the distance between cars, and in the other, a conductor was struck in the head by a baggage truck placed too near backing train.

A. T. HARDIN, vice-president of the New York Central Lines, paid a tribute to railroad employes in general, when, in addressing a safety first meeting of that road in New York City, on December 1st, he said:

"We have among us thousands of men whose type illustrates what we mean by 'Safe men.' The best of them sometimes make a mistake, because it is human to err, but it is the high average efficiency which counts. The Empire State Express has run to date about six million miles, or around the world two hundred and fifty times. During that period I cannot find where an engineman or a conductor or any of their crews have been guilty of sufficient neglect of duty to have jeopardized the safety of the passengers who have entrusted themselves to their care. The names of these men, and many others in the service who belong to a similar honor roll, are so well known to you that they need not be mentioned here. We all know what they stand for; namely, service, and duty well done, which means Safety. We venture the belief that hundreds of men who have served under these men were taught their lessons and are giving a good account of themselves.

"Now, these honor roll men, and others like them, are not mere accidents. They have learned their professions from the careful men who preceded them, and in turn must make the next generation of railroad men by the same process. The extent to which this is done, and the extent to which we continue it, is the measure of the degree of Safety which we shall attain."

IN the interests of greater safety, the general manager of the Pennsylvania Railroad has called particular attention to the danger of track laborers wearing protection for their ears which effect their sense of hearing. It appears that three track laborers of this road were struck and killed by an extra freight train on December 26th, on one of the divisions at a cross-over, while they were engaged in cleaning snow from the switches, and all of these men wore caps with mufflers to protect their ears. In view of this fact, the general manager has considered it necessary to issue the following notice:

"The wearing of ear mufflers by trackmen renders their hearing less acute while being worn, and while it is not desirable to prohibit the practice of wearing mufflers, foremen should be warned to pay particular attention to the men who wear them, in regard to warning the men of approaching trains. All foremen should be advised of this at once, in anticipation of the severe weather during the next two or three months."

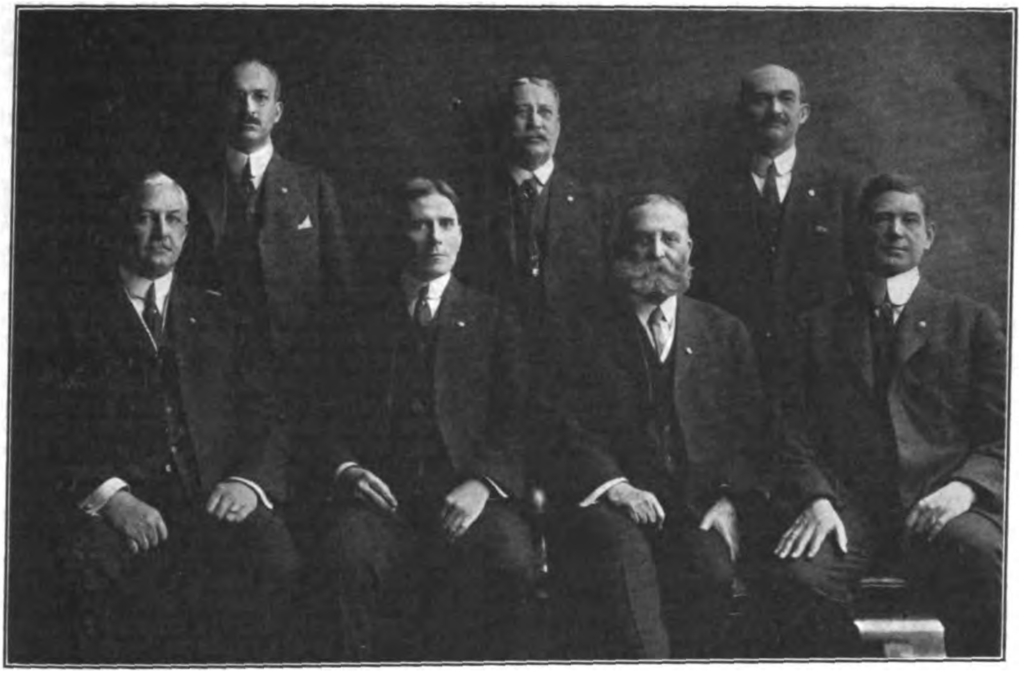
General Safety Committee of the Baltimore and Ohio.

IN our January issue attention was called to a new departure made by the Baltimore and Ohio in appointing a general safety committee who would, in the future, devote their entire time to studying the question of safety operation. This committee which is shown in the following photograph, consists of J. G. Pangborn, chairman, E. R. Scoville, for several years a division superintendent, representing the transportation department; John Hair, formerly superintendent of locomotive power, representing the mechanical branch of the service; W. McC. Bond, formerly division engineer, representing the maintenance of way department; J. T. Campbell, of several years' experience as an agent, representing the stations and traffic department; Dr. E. T. Parlett, representing the relief department of matters of sanitation, and B. C. Craig, who for the past nine years has been an inspector of railway safety appliances in the employ of the Government. There will also be an advisory committee acting in conjunction with the general safety committee.

This new departure on the part of the Baltimore and Ohio will undoubtedly be watched with interest by other carriers and it is not unlikely that the near future will see committees of a similar character organized whose duty it will be to give their exclusive attention to the matter of greater safety.

In connection with the manner in which the scope of the safety work has been broadened through the reorganization of the general safety committee, it is of interest to note the company's plans for an extensive campaign of sanitation through which it is hoped to protect the health of employes by providing wholesome working conditions, while at the same time, safeguarding life and limb. Dr. Parlett to whose charge this particular work is entrusted, is making an inspection of the restaurants of the railroad, where the traveling public and employes are served meals, and the rest-houses and other quarters at division and terminal points where employes spend their time.

The sanitary conditions of passenger trains



General Safety Committee, Baltimore and Ohio System.

Standing, left to right: Dr. E. T. Parlett, sanitation; E. R. Scoville, transportation; J. T. Campbell, traffic and station service.

Seated, left to right: John Hair, mechanical; W. McC. Bond, maintenance of way; J. G. Panghorn, chairman; B. C. Craig, safety appliances and inspection.

comes within the province of the General Safety Committee likewise, so that every effort is being made to protect the health of the traveling public. The proper ventilation of trains will receive careful attention and State laws applying to the cleanliness of trains will be enforced.

For several years the Baltimore and Ohio has maintained rigid regulations to insure the healthy condition of employes of the dining car department who handle the food served on trains. All cooks, waiters and other employes are examined by a company physician when employed and must submit to periodical examinations to show that their health has not become impaired. Such examinations are now being made by the General Safety Committee of the employes of restaurants and rest-houses. These employes are being examined by physicians and must hold certificates of health to show that they are free from contagious or communicable disease. Women employes are examined by female physicians in the employ of the company.

An educational campaign is being conducted by the General Safety Committee to impress upon the employes and their representatives on the local committees the importance of cleanliness, methods of combating the spread of contagious and infectious disease as well as matters pertaining to social hygiene.

Frisco Establishes Women's Safety League.

THE Women's Safety League recently organized by the St. Louis and San Francisco Railway, is rapidly becoming recognized as one of the most helpful and efficient branches of the safety system of that road.

The management of this League has been entrusted to Mrs. E. G. Newlands, of Augusta, Kansas, wife of a Frisco employe, and while still in the experimental stage, there is every indication that the movement will prove eminently successful. The object of the League is of course to promulgate the safety movement, bringing into play the subtle but far-reaching influences which women can exert on those whose well being is their vital concern.

The League was launched with a charter membership of one thousand, subdivided into ten divisions of ninety each and four terminal chapters of twenty-five each, representing the ten operating divisions and four terminal divisions of the Frisco. Members of the League wear badge pins, and have pledged themselves to improve every opportunity to exert their influence for Safety First, the promotion of the spirit of brotherhood among the Frisco employes, of loyalty to the company, and above all else, of duty to humanity.

North Western Wins Special Recognition for Safety Work.

ON account of a very comprehensive exhibit at the First Annual Exposition of Safety and Sanitation held in New York from December 11th to 20th, under the auspices of the American Museum of Safety, the Chicago and North Western Line has been awarded a diploma and grand prize by the Committee of Award.

The company's exhibit was located at the main entrance of the new Grand Central Palace in which the exposition was held and had for its center, a large map reproduced in the January issue of the Railway World, showing the safety organization, over which was placed a large illuminated sign showing the safety emblem in colors. The exhibit also included a series of photographs mounted on a multiplex stand, showing the right and wrong methods of doing work; four special machine models, the safety banner which has been awarded the company, also a display of literature issued by the Central Safety Committee at different times.

Southern Railway Organizes Bureau of Prevention.

THE general manager of the Southern Railway has added to his department a Bureau of Prevention, the function of which will be to study in detail the causes of accidents for the purpose of disclosing, if possible, similar conditions should they exist. The Bureau will also make an effort to devise means for temporary prevention under such conditions and to develop plans of correction for obviating the re-occurrence of any such accidents.

Safety First on the Grand Trunk Railway.

THE first meeting of the General Safety Committee of the Grand Trunk Railway, was held at Montreal on January 12th. The report of the division terminal and shop committees, showed that during December 480 employes were cautioned by members of safety committees against unsafe practices and that 500 unsafe conditions were corrected. During the last four months of 1913, with the safety movement in effect as compared with the same month of 1912, before the movement was started, there were sixteen fewer employes killed, a decrease of 50 per cent, and one hundred and fifty fewer employes injured, a decrease of 11.5 per cent. These favorable results were procured in spite of a heavier volume of traffic.

Annual Report of Police Department of Baltimore and Ohio System.

CRIMES committed against railroads are increasing, according to the annual report of the police department of the Baltimore and Ohio System, which shows that 13,129 arrests were made during 1913, as compared with 10,417 arrests during 1912. There were 8,449 convictions in 1913, while in 1912 the number of convictions was 6,515. This increase in crime added materially to the expense of the railroad for doing business during the year.

The report of G. A. Ogline, superintendent ofg police, covers all classes of criminal offenses, from petty larceny and disorderly conduct to train wrecking, highway robbery and murder. The most frequent offenders were those who "violated railroad laws," for which 8,303 arrests of tramps and others unlawfully using the railroad property were made. Arrests for intoxication and disorder numbered 2,526, with 1,567 arrests for larceny, 176 for burglary and 3 for murder. For receiving goods stolen from the railroad there were 67 arrests.

Commenting upon the large number of arrests of trespassers—tramps and other vagrants and loiterers about the railroad—Superintendent Ogline says: "It is evident that the number of persons unlawfully riding over the railroads and trespassing upon the property in other ways is on the increase, but the officials have been badly handicapped in coping with this evil on account of the lack of co-operation on the part of authorities The courts will handle a few offenders, but it is continually impressed upon the railroads' police departments that the arrests to trespassers must be held to the minimum because the cities, towns and counties are unwilling to bear the expense of harboring this class of offenders in jails and other institutions of detention. In sections of Pennsylvania, West Virginia and Ohio, however, where sentences to work on county roads and at other hard labor have been imposed, trespassing is not so general as in other territory where the road operates."

The police officials of the Baltimore and Ohio are hopeful that the Maryland Legislature will act favorably upon the recommendatiion of Governor Goldsborough, that stringent laws be enacted against trespassing upon railroad property. A report was made to Governor Goldsborough recently by the legal department of the Baltimore and Ohio, in which the difficulties experienced in operating the railroad, due to molestation by tramps and other vicious characters who steal shipments, wreck trains and commit other crimes were pointed out; and this presentation of the subject was made the basis of the Governor's message to the Legislature.

Mechanical

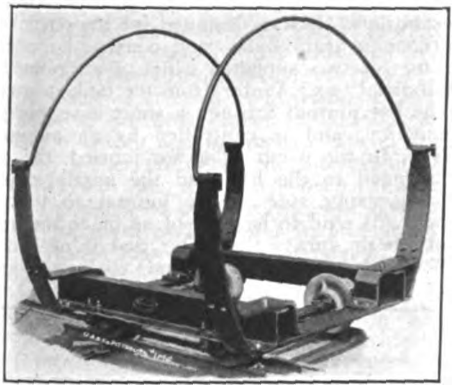
A New Car Deflector and Ventilator.

DOCTOR ROBERT S. HENRY, of Chattanooga, Tenn., has been granted a patent on a car deflector and ventilator which was invented jointly by him and S. B. Shipley of the same city. The deflector is an improvement on the dust and cinder guards used in the windows of passenger cars. It is so designed as to be removable and can be set in position at the end of the window and reversed from one side to the other. The object of the invention is to provide a simple and more efficient dust and cinder guard than those now in use. It is so constructed as to operate both as a guard and as a ventilator by causing an outward suction of air from within the car through the window to which it is applied. It consists of certain novel features of construction and a combination of parts so arranged that when the device is in position and the train is moving the current of air produced by the rush of the train comes in contact with the outer face of the guard and the cinders are carried by the current and deflected downward. The device is especially desirable for windows of smoking cars for the reason that it readily draws out the smoke from inside the car. Arrangements are being made to manufacture a number of the guards in Chattanooga after which they will be installed on passenger trains with a view to demonstrating their efficiency. The invention has been examined by practical railroad men who pronounce it one of the best devices of its kind, owing to its peculiar construction and the scientific principles upon which it works.

A Movement for the Preservation of Railroad Ties.

BECAUSE of the scarcity of suitable railroad ties railroads are either installing creosoting plants or are purchasing creosoted ties from the different private companies.

This wide demand for creosoting material has been the means of directing considerable attention to the developing of machinery for this work and the equipment has improved wonderfully within the past few years.



General Appearance of Car Used in the Process of Creosoting Railway Ties.

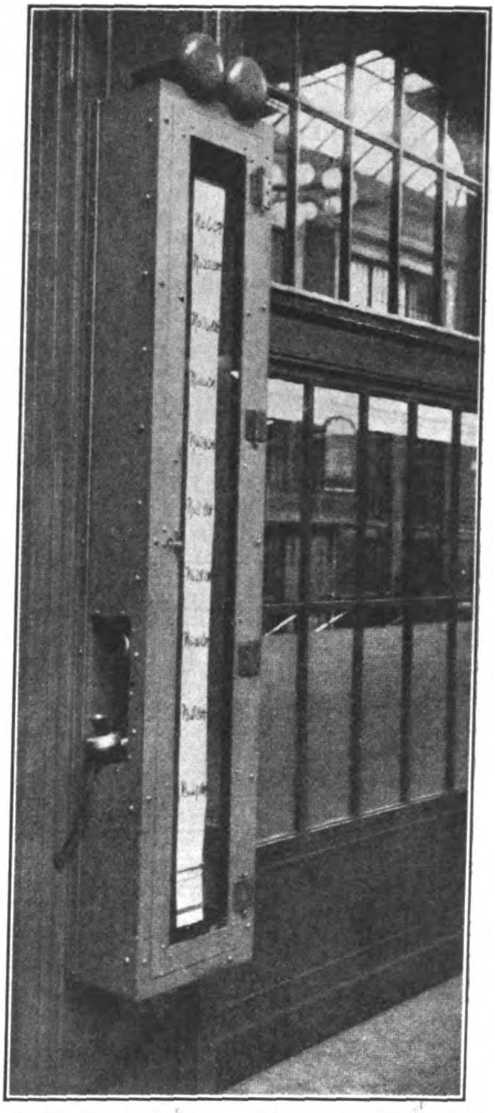
The accompanying cut shows one of the latest type of cars used for creosoting railroad ties and it will be noted that special attention has been paid to utilizing all the space possible and the end sills are dropped so that several ties can be loaded in between the side sills. The belts or bars which hold the ties on the car are provided with pivoted pins at the end, which when turned, parallel with the bars allow them to be pulled out with no difficulty and when turned perpendicular, their normal position prevents them from coming out. It has been found that because of rapid corrosion in the cars, caused by some of the solution used in creosoting, heavy bar sections are better than angles or channels. They resist corrosion, better than structural shapes and in this case the cradles are made of heavy bar to guard against any weakness in them as this would cause difficulty in operation of the equipment.

The cars shown on cut are for the creosoting plant of Charlotte Harbor & Northern Railway Co., and were furnished by the Orenstein-Arthur Koppel Company, of Koppel, Pa.

Telautographs in the Northwestern's New Chicago Station.

AMONG the many devices which have been installed in the new passenger terminal in the Chicago Northwestern Railway at Chicago for the convenience of the traveling public and the expeditious movement of trains in and out of the station is the telautograph, an electrical apparatus that is as novel as it is useful.

The telautograph, unless you were on the lookout for it, would probably escape your notice, notwithstanding the fact that there are twenty-one of them in use in the Terminal.



Telautograph Employed in the Chicago and North Western's New Station at Chicago.

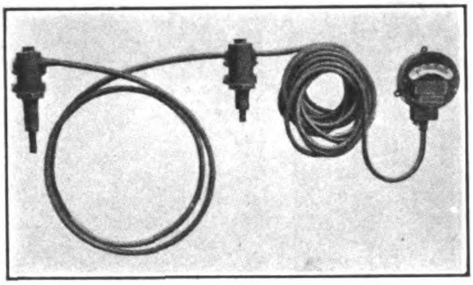
It is an automatic writing machine, that reproduces handwriting by electricity. At the Terminal they are used to advise employes as to arrival and departure of trains, and to distribute train reports from the dispatcher's office.

For example: The dispatcher's office will receive report that train No. 22 is on time. By writing this information on the device in his office, the twenty-one telautographs located at various points in the Passenger Terminal, immediately give out the same information. The mechanical arm, almost human in its operation, writes across a sheet of paper that train No. 22 is on time. Other messages transmitted in the same manner are that train so and so will arrive on track No. 11, or that train No. 512 has eleven cars.

The illustration shows the location of one of these devices in the Terminal, and also a reproduction of some of the messages which have been transmitted.

Employing the Pyrometer for Superheater Locomotives.

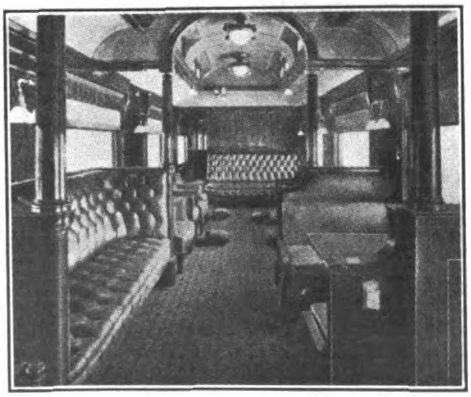
THE Locomotive Superheater Company, of New York, has developed a pyrometer for use on superheater locomotives which is said to satisfactorily indicate to the engineer at all times the temperature of the steam in the steam chest. The instrument is of the electrical type and consists of thermo couples, constructed and arranged in accordance with the Bristol system. The cold end is located in the boiler in the saturated steam and the hot end in the steam chest, directly in the flow of the superheated steam. Electrical connections are established to the indicator of the milli-voltmeter type, located on the gage bracket in the cab. The accompanying illustration gives an idea of the arrangement of the parts of the pyrometer apparatus.



PYROMETER AND ACCESSORIES CONSTRUCTED FOR USE ON SUPERHEATER LOCOMOTIVES.

Lounging Car on the Northwestern Limited.

THE accompanying attractive photograph shows the interior of a lounging car with its two spacious parlors, which is one train between Chicago and St. Paul, Minn. The car is perfectly ventilated and is equipped with of the distinctive features of the Northwestern's easy chairs and lounges richly upholstered in Spanish leather. It can readily be imagined that it makes for sociability and good fellowship, having many of the conveniences of a modern club. Close at hand is a conference room, sanitary bubbling fountain, writing desk, current periodicals and a well stocked buffet.

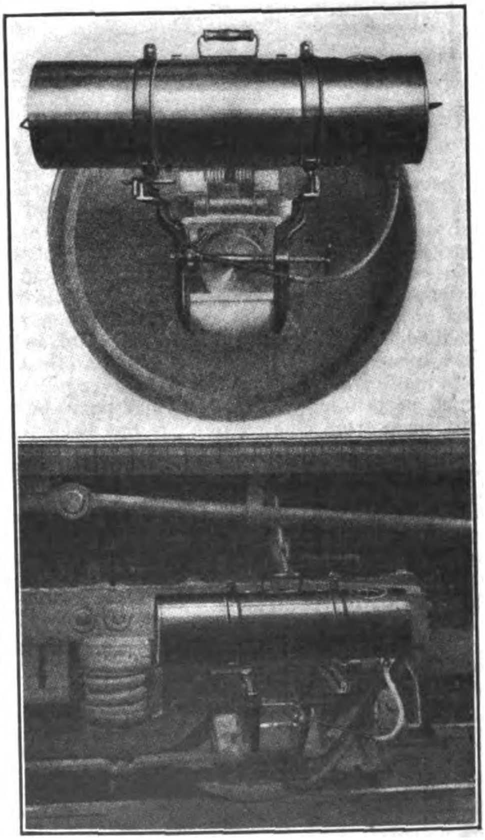


INTERIOR OF NORTH WESTERN'S LOUNGING CAR ON TRAIN RUNNING BETWEEN CHICAGO AND ST. PAUL.

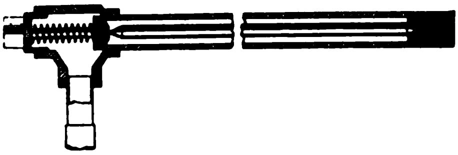
A Journal Cooler.

THE Transportation Utilities Company, of New York, has recently put upon the market a journal cooler which is claimed to be a distinct improvement on present methods of cooling journal boxes.

It is designated as the B.-J. cooler and its general appearance is indicated by the following illustrations. It was designed for the purpose of overcoming train delay and consists of a tank resting on two supports which are cammed to the journal box. Water from the tank is carried to the hot journal through a short hose and pipe connection, and is controlled by an automatic valve. In the event of a hot journal, the tank is cammed to the box and the nozzle inserted on the rising side of the journal so that the water will tend to be carried up on to the brass. This nozzle sprays the water that is needed the full length of the hot journal, cooling it grad-



TWO PHOTOGRAPHS OF JOURNAL COOLER, SHOWING MANNER IN WHICH IT IS ATTACHED TO JOURNAL BOX.



Thermostatic Valve Which Controls the Flow of the Water

ually. The thermostatic element indicated in the accompanying illustration, expands in the direction of its length, forcing back the feed valve and allowing free flow of the cooling agent to the spray pipe, thus bringing about a gradual uniform cooling of the journal and brass. The cooling of the journal causes a gradual automatic contraction of the thermostatic element by which the flow is reduced until a normal temperature is reached, at which time the flow is practically stopped. The cooler can be attached during a regular stop of two minutes.

Electrical

A Comparison Between the Gross Earnings and Operating Expenses of Steam and Interurban Electric Lines.

A BOOK by Louis Fischer, expert in electric railway economics just published by the McGraw-Hill Company, of New York, contains some interesting comparisons of recent tendencies in the gross earnings and operating expenses of steam and interurban railroads. In brief, Mr. Fisher finds that the interurban electric railways in late years have been confronted with the problem of their expenses of operation showing increases even greater in proportion to gross revenues than those complained of by the steam railroads of the country.

"The average gross revenue per mile of line on 243,229 miles of steam railroads in 1911," says Mr. Fischer, "according to the statistics of the Interstate Commerce Commission was $11,589, of which $2,708 was derived from passenger traffic. Similar statistics for electric interurban railways are not so fully available, but from the records of typical cases, which may be said to be representative of all roads qualifying as electric interurban railways under the definition hereinbefore given, the average gross revenue per mile of line is $5,130.

"While these figures are interesting from the view point of disclosing the relative earning power of steam railroads and electric interurban railways, they are of little importance on account of the different conditions prevailing in the two fields.

"The electric interurban railways, deriving substantially all of their revenues from passenger traffic sources, are limited to sections of dense population where large passenger traffic exists. Steam roads, deriving a large percentage of their revenue from freight sources, are not limited to such restricted areas, and have been located more especially for the primary purpose of developing freight traffic. Therefore, that the earnings of the electric interurban railways should be considerably higher than the passenger revenue of steam roads and considerably less than the gross revenue of steam roads is but a logical result."

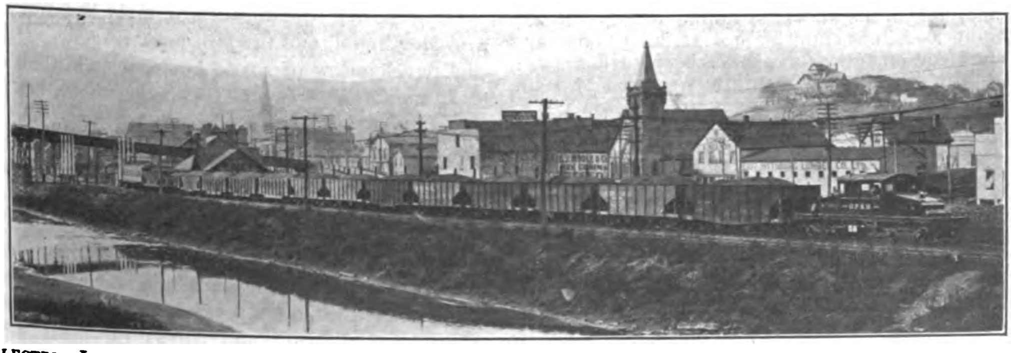
But Mr. Fischer finds that by taking the figures for both classes of roads over a period of ten years a highly significant difference in trends is seen.

"From this it is obvious," he says, "that the growth of revenue per mile of line on electric interurban railways is not keeping pace with that of steam railroads. It appears also that the operating expense per mile of line on the steam railroads has not increased as rapidly as the revenue on these lines. * * * The growth of operating expense on electric interurban railways has substantially kept pace with the growth of revenue per mile of line, with the result that the increase of net revenue per mile of line on electric railways has been very little. It was less in 1911 than in 1910.

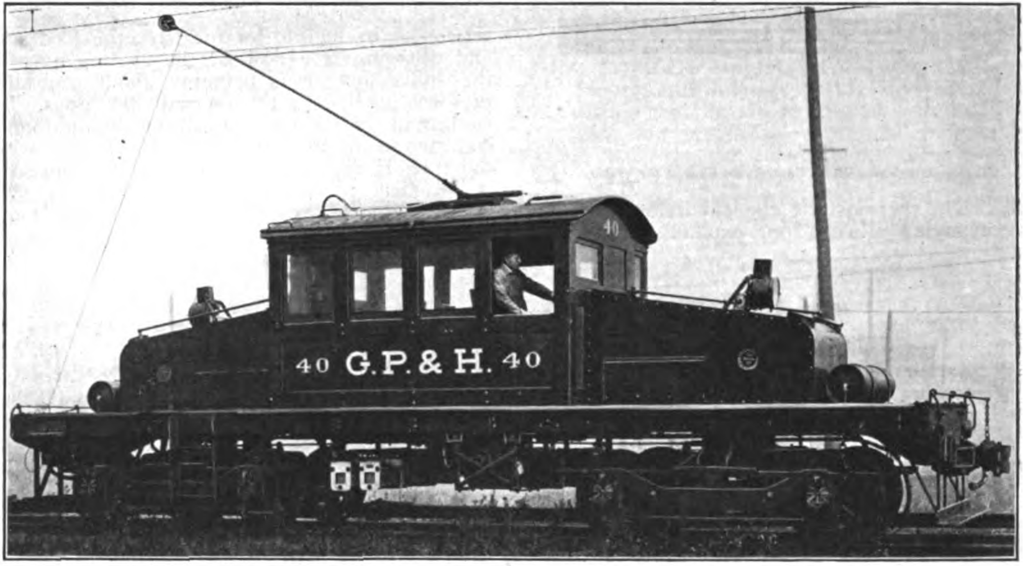
"One of the characteristics of electric interurban railways, the mileage of which has not been extended from time to time, is that the available revenue was quickly developed and that at the end of this period the revenue has increased at a very low rate."

Experiments with Electric Locomotive Service on Canadian Railroad.

THE Galt, Preston and Hespler Railway Company, Ltd., Preston, Ontario, placed the 40-ton Baldwin-Westinghouse locomotive herewith illustrated, in service on Novem-



Electric Locomotive Built by the Baldwin-Westinghouse Company Shown in the Act of Drawing Heavy Freight Trains.



Electric Locomotive Built for the Galt, Preston, Hespler Railway Company of Preston, Ont., by the Baldwin Westinghouse Interests.

ber 20th, 1910, and since that date has been in continuous operation, twenty-four hours every day except Sundays, averaging about 150 hours per week. This service includes hauling practically every kind of freight in standard steam railroad rolling stock, between the Canadian Pacific Railroad at Galt, Berlin and Waterloo, a distance of from 12 to 14 miles north.

Although the haul is not so very long there are a number of 2 to 2½ per cent grades, from one to two miles long.

The maximum number of cars hauled in one train is about 25, the average number being 15, and the tonnage per train is about 200 tons or on four trips of road service per day, 2,000 tons.

It is hardly possible to estimate exactly the total mileage as the greater part of the time, 16 hours per day, the locomotive is in switching service. No record is kept of the tonnage and mileage, but the switching mileage would easily equal half, if not three quarters, of the road service.

This locomotive is equipped with four Westinghouse No. 308-B-2 commutating-pole, 600-volt, railway motors, rated at 120 horsepower, and unit switch control.

The locomotive is given one half hour inspection every twenty-four hours, and about five or six every Sunday when making light repairs, such as applying brake shoes, changing wheels for tire running and inspection of motors, air-brakes, and control equipment. Tires have been turned twice since this locomotive went into service and the total repair account to date is given below:

Air compressor (principally due to armature and field trouble due to low trolley voltage)	170.00
Tire turning	45.00
Motor axle bearings	30.00
Unit switch control	50.00
Trolley parts, wheels, harps, poles and bases	110.00
Brake shoes	270.00
Miscellaneous	30.00
Total (from Nov. 30, 1910, to July 14, 1913)	$705.00

The total, $705.00 for repairs on this locomotive covering a period of over 2½ years is considered a very good record by the operating company in view of the large amount of service received.

Progress in Western Electrification.

By Albert Marple.

IT is the belief of many of the electrical men in the Western part of this country that the next decade will see half of the railroad mileage west of and through the Rocky Mountains, that are now propelled by steam, under electrical operation. This decision has been reached after a careful examination and study of the present railroad situation. At the present time the Southern Pacific is steadily electrizing lines entering and contiguous to important terminals, the Santa Fe has broached a plan for the electric operation of trains on a portion of its system in the inter-mountain country, the Chicago, Milwaukee and St. Paul is engaged in the application for hydro-electric power to 440 miles of main line track in the Northwest, and the Hill lines are now starting the development of 40,000 horsepower in the Cascade mountains. Coupled with these facts are the plain truths that coal and oil are increasing in price, while electric power, especially of the hydro-electric variety, is getting cheaper. This statement is proven by the report of Electrical Engineer Babcock, of the Southern Pacific, to the effect that the electrizing of the line over Tehachepi Pass would effect a saving in fuel amounting to $140,322 a year for that line. Since the vast California and Texas oil fields were opened oil has been generally used for fuel in that Western country. It is claimed, however, that cheap oil is a thing of the past. An evidence of this action of the Kansas City Southern, when placing an order for locomotives, in contracting for coal burners rather than oil consumers. This action is generally considered as premonitory of the change in power of all oil-burning roads. It is very probable, however, that the change in power, especially where hydro-electrical energy is available, will be from oil to electricity rather than from oil to coal.

Notwithstanding the fact that the Southern Pacific Company has been the pioneer in the work of changing from oil to electrical power, its activities in this line have been veiled by the organization of subsidiary companies to do the work. For instance, in the southern portion of California, the Pacific Electric, which is a Southern Pacific property, is now operating much mileage that was formerly under steam operation. In the San Francisco Bay district, the Oakland, Alameda and Berkeley, the Peninsular Railway Company and the San Jose Railway Company are doing a work similar to the Pacific Electric. In the San Joaquin Valley, the Visalia Electric is acquiring and electrizing some Southern Pacific mileage. While all of these roads are doing building on their own account, this work would doubtless have to have been done by the Southern Pacific if that company would keep its grip on the increasing traffic units of the State.

The Portland, Eugene and Eastern Company, as a subsidiary of the Southern Pacific, is probably doing the most characteristic piece of electrizing of that company's line in and about Portland. The lines to be electrized in that section will total 340 miles, and the cost of this work is estimated at $12,000,000. Included in this is the building of new lines through the Williamette Valley, in addition to electrizing two Southern Pacific branch lines and two steam roads which were purchased. In main-line electrization the ever-progressive Southern Pacific is considering three outlets from the great central valleys of the State, south of the Tehachepi Pass, north over the Siskiyou Mountains and east of the Sierra Nevadas, as strategic points from which to start. At a recent date Electrical Engineer Babcock, of those roads, made investigations as to the feasibility and possibility of doing this work. On account of the high market on bonds he is not optimistic so far as possibility is concerned, but he thinks the work is very feasible.

In regard to these proposed improvements some figures from Mr. Babcock's estimate may be of interest. The first cost he estimates at $7,172,600, which would be reduced to $5,707,700 by the credit obtained from the release of steam locomotives for use on other portions of the system. Included in his estimate are $2,085,000 for electric locomotives, $1,760,000 for a generating station, $1,610,000 for sub-stations, $980,250 for a contact system and $430,050 for a transmission system, the remainder being for minor improvements, such as block signals, shops, inspection sheds, etc. In this estimate the annual operation cost is set at $721,519, as against $687,032 for the present steam power, but Mr. Babcock's figures include $256,847 for bond interest. Deducting this the total operating cost under electricity would be $464,672, or $222,360 less than the present steam operating costs. Of this amount a saving of $140,322 is ascribed to the change of fuel.

Although the Santa Fe is not committed to electrization, that company has just been interested in a plan to harness the waters of the upper Arkansas River. Business and farming interests broached the plan, stating that they would be willing to share in the expense, the Santa Fe to take half of the power for train operation, while they took the remainder for commercial use.

Electrization work on even a larger scale than these just mentioned has been started by the Chicago, Milwaukee and St. Paul Railroad between Avery, Idaho, and Harlowton, Mont., a main-line distance of 440 miles. C. A. Goodnow, assistant to the president of this road, stated recently that the work undertaken by his company is the most general electrization yet undertaken by any steam road and undoubtedly foreshadows the electrification of the entire line from Harlowton to the Pacific Coast, a main-line distance of 865 miles, including the line to Tacoma. It is understood that the power for this long line is to be furnished under long-term contracts with the Montana Power Company and the Thompson Falls Power Company. It is planned that eventually a large power plant at Great Falls, Mont., is to be constructed, this to generate 100,000 horsepower. This, with the power from the other plants, will form one tremendous reservoir of electric energy from which to draw any amount of power necessary to operate the railroad. The intention is to do all work, including switching, inside the electrical zone, with electric locomotives. It has been determined that a single freight locomotive is capable of handling 2,000 tons trailing one a one per cent grade and two the same tonnage on a two per cent grade at a speed of from fifteen to eighteen miles an hour.

Mr. Goodnow also states that electric locomotives can make from 200 to 300 miles at the outset and there will be no delays on the road for coal, water or cleaning fires and it is a fair conclusion that the tonnage will be handled with fewer locomotives at higher average speed and with a regularity that will give greater satisfaction to shippers and passengers.

A little information as to the changed duties of the dispatcher under electric operation, is here given:

"As the dispatcher will have only 20,000 kilowatt hours available at first he must figure to move his traffic and not use electrical energy in excess of that amount. To this end he not only must have the entire situation clearly before him so that trains will not be started from termini at hours when they will be unreasonably delayed into intermediately waiting for current, but he must supervise their speed since the speed of trains on ascending gradients exactly represents electric energy used. In order to push an important train across a mountain range at maximum speed it may be necessary for the dispatcher to slow down other trains or he may order one or more trains to move at maximum speed to provide for the prompt movement of subsequent trains. A train making a given distance in one hour will use the same total electrical energy if it makes the run in twenty minutes. In other words, if a run is made at a speed of 7½ miles per hour the same total number of kilowatts will be used as if the run is made at the rate of fifteen miles per hour. While twice the amount of current is used at the higher speed it is used only half the time."

Terminal Improvements

Reconstruction of North Philadelphia Passenger Station.

AS a part of the comprehensive plan of improvements the Pennsylvania Railroad is providing in and around Philadelphia the Board of Directors has authorized the reconstruction of the North Philadelphia passenger station. This is in addition to the work which has already been authorized at that point and which is nearing completion.

It was because of the growing importance of North Philadelphia as a station for through trains as well as the very large increase in the number of Philadelphians using this station for New York and Atlantic City trains that the Pennsylvania Railroad decided to enlarge the facilities and conveniences for passenger trains at that point. Eight tracks four of which are for passenger trains two for eastbound and two for westbound trains are now being completed. Ornamental concrete bridges to carry eight tracks have been built over the Philadelphia and Reading Railway and over Broad street.

Two island platforms one of which is completed and in use will be used by passenger trains, so that four trains, two in each direction, can stop there at one time. These platforms are all at the level of the train floors. This is the first station to be so constructed following the Pennsylvania Station in New York City, and Manhattan Transfer.

To avoid delay to freight trains because of these enlarged passenger facilities, two additional freight tracks will be provided in the vicinity of North Philadelphia station.

The improvements and facilities at North Philadelphia provide for rebuilding the basement and present train floor of the station, so that the ticket offices, baggage room and entrance lobby will be located on the present basement floor at about the same grade as North Broad street and the present subway under the tracks leading to the island platforms.

This will eliminate the necessity to use any stairway except those leading to the island platforms. The present train floor level will provide space for a large waiting room, retiring room and lavatories, and probably a lunch room.

In order to make room for these improvements it will be necessary to build a new power house for housing the heating plant and other machinery now located in the basement of the station.

With tracks now building, the Pennsylvania Railroad Company will have 544 miles of track inside of the city limits of Philadelphia, 31 passenger stations, 24 freight stations, and 10 riverfront stores, flour and hay houses.

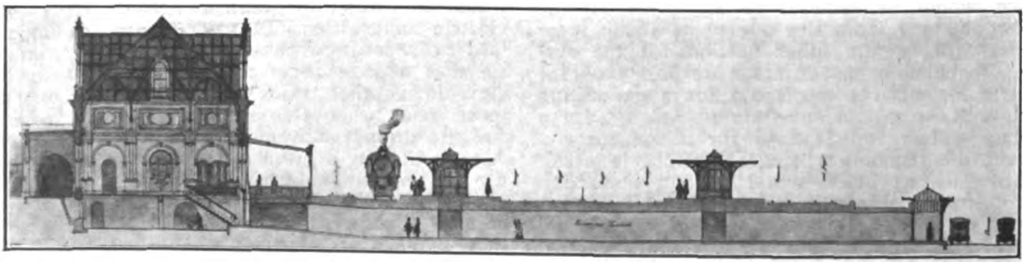
Records show that during the past year this company received and dispatched at Philadelphia approximately 2,500,000 freight cars, and there arrived and departed 25,000,000 passengers. One million pieces of baggage were checked at Philadelphia stations.

The Pennsylvania Railroad operates in and out of Broad Street Station 492 trains regularly each day, besides 48 trains serving Philadelphia at stations other than Broad Street, and 105 trains handling mail in and out of Camden. There are 345 trains handling mail daily and out of Philadelphia proper on the Pennsylvania Railroad, of which not less than 95 per cent are equipped with complete facilities for assorting mail en route. These trains bring into and carry out of Philadelphia about 500,000 pounds of mail every 24 hours.

In 1913 the company collected a total of $27,592,961.07 in Philadelphia on account of freight and passengers. It expended in operations in this city $24,371,441,—not including dividends and interest on bonds, or similar general disbursements. The Pennsylvania pays out in Philadelphia for salaries and wages alone upwards of $16,000,000 a year.

The company, with other railroads, will participate in the very large expense designed to improve the industrial possibilities of South Philadelphia. It is also just completing a large, modern grain storage elevator at Girard Point, at a cost of upwards of $1,200,000. The Pennsylvania Railroad has, during the past ten years, expended in improvements in Philadelphia more than $17,000,000.

These figures give some idea of the enormous business which the Pennsylvania Railroad handles in Philadelphia. It was to provide facilities to accommodate this traffic that the company determined to electrify its suburban lines to Paoli and to Germantown and Chestnut Hill, to provide at Broad Street Station for an electric suburban service, to replace with a five-track structure the old two-track bridge over the Schuylkill River at Girard avenue, and now to rebuild and enlarge its facilities at North Philadelphia, which recently has become of very great importance as a passenger station.



GENERAL OUTLINE OF THE PENNSYLVANIA RAILROAD'S IMPROVEMENTS AT ITS NORTH PHILADELPHIA PASSENGER STATION.

New Freight Station for Pennsylvania Railroad.

ON February first, the Pennsylvania Railroad opened a new freight station in New York at Pier 22, East River. The design of the Pennsylvania in opening the new station is to make its facilities more accessible. All of the down-town freight facilities have heretofore been located on the North River side of Manhattan Island, making it necessary for shippers on the East Side to haul freight across the town.

For the convenience of business men in Harlem and the upper part of the East Side, the compnay will continue to maintain a freight station at the foot of 125th street, East River.

The Southern's New Joint Freight Terminal at Macon.

SPLENDID facilities for handling both carload and less-than-carload lots very expeditiously have been recently provided by the new joint freight terminal of the Southern Railway, the Georgia Southern and Florida Railway and the Macon and Birmingham Railway. This terminal consists of separate inbound and outbound freight warehouses each 492 feet in length, together with two covered transfer platforms, and served by seven tracks accommodating seventy cars. The cotton platform is 250 feet long and team tracks for the delivery of bulk freight accommodate one hundred cars. Three paved drives have been laid to serve warehouse and team tracks. In addition to these facilities, the Southern Railway has recently completed and placed in service a new yard at Macon which has greatly improved the handling of business in Macon proper and through Macon.

The new joint facilities are of such a character that they not only provide for the present freight traffic at Macon, but anticipate the great growth of business which is hoped for in the near future.

Terminal Improvements at Chattanooga, Tenn.

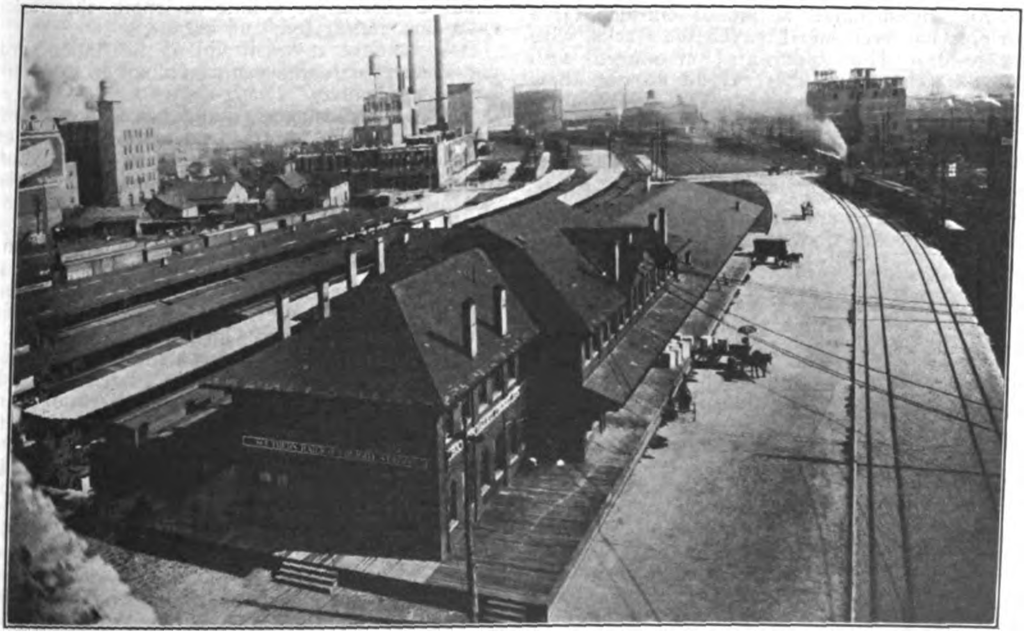
ONE of the most notable improvements made by a transportation company in the South recently is that of the Southern Railway, at Chattanooga, Tenn. To meet the demands of increasing business at that point, the Southern has spent, roundly, $125,000 in extending and making thoroughly modern its freight terminals. All of this amount, except a few thousand, was used in developing the terminals shown in the accompanying illustration, covering some fourteen acres.

As a result of the improvements, patrons of the Southern in Chattanooga—including about 60 jobbing houses and nearly 300 manufacturers, such are the industrial and commercial proportions of the city—now enjoy the benefits accruing from one of the best stations of its kind in the South. Tracks serving the inbound and outbound freight houses afford sufficient space for the loading and unloading of 100 merchandise cars daily. Public team tracks afford space for placing 50 cars for loading and unloading.

Considering the features of the freight terminals under the improved conditions, and from left to right in the illustration, they are: Pillar crane on platform alongside track for handling machinery and other very bulky freight; automobile unloading platform; driveways for drays unloading freight to outbound station; outbound station; tracks for outbound freight; tracks for inbound freight; inbound freight station; drive way, and main line of freight tracks.

The outbound freight house is an entirely new building, while the inbound freight house is the old structure, remodeled and repaired adequately. In the instance of both, an unoccupied space has been left at the eastern extremity so that as soon as future growth of business warrants, they can be extended.

The permanent and finished character of all improvements cannot fail to impress anyone making



NEW FREIGHT TERMINALS AT CHATTANOOGA, TENN.

an inspection of the terminals. For the paving of driveways and that part of King street occupied by the tracks, a six-inch concrete base was laid, surmounted by a two-inch sand bed, and topped with a four-inch brick course. The new station, 34 feet by 250 feet, has a foundation of 24-inch concrete walls and six-inch concrete granolithic flooring. The framework is of steel. The two-inch concrete roof is covered with a composition roofing. There are no side walls, the only enclosures being rooms for check clerks and a small over-freight locker room. The platform is equipped with three dial scales and one beam scale. All buildings are provided with standard fire hydrants, of which there are two in each depot and three on each platform.

Two frame platforms have been constructed, each 14 feet wide, one being 528 feet long, the other 517 feet. They are built on concrete piers, and have composition roofing. The framework is wood, this material being chosen because the ground in the vicinity is surfaced with cinders which produce fumes very destructve of steel. The timbers are of long leaf yellow pine.

A brick pavement, averaging 35 feet in width, by 115 feet long, is the approach to the platform which supports the 15-ton hand power pillar crane, this being laid on massive reinforced concrete foundation. Next adjoining, a tar macadam pavement, averaging 32 feet in width, and 200 feet long, approaches an automobile platform 80 feet by 16 feet, onto which automobiles can be unloaded from cars and run to the ground on an inclined plane, with easy access therefrom to the city streets.

All tracks were laid with 80-pound steel and provided with latest improved switches. At the end of each track is a steel bumping post, anchored not only to the rails but five feet in the ground, and supported on concrete foundations. Each of the paved driveways has its own sewer and drains. Surface water is carried off immediately. Wherever two adjacent tracks run parallel for any distance, a line of six-inch terra cotta pipe has been laid between the tracks, with open joints. The joints are surrounded with cinders which act as filterers and do not allow soil or other solids to pass into the sewers. It is a safe assertion that these yards are the best drained of any in the South.

The work of construction was under direct charge of S. D. Moses, assistant to the district engineer of the Southern Railway. Very little contract work was done.

Extensive Passenger Yard Facilities at Minneapolis.

THE Chicago, St. Paul, Minneapolis and Omaha Railway, one of the Chicago and North Western Lines, has just completed an immense passenger terminal yard in Minneapolis at a cost of $2,000,000.

It covers twenty-one acres of ground and has, in addition to its vast trackage space, a modern thirty-stall roundhouse, up-to-date machine shop, boiler room, engine room, boiler washing plant, lavatories and rest rooms for the employes, store house, water system and pumping station, heating apparatus, double cinder pit, and an automatic coaling station. These facilities make this yard one of the most modern in the West.

Every piece of machinery in the plant is electrically operated, with the exception of the two turbine generators.

The roundhouse is equipped with all labor saving devices known, even including compressed air for operating lifts and for boiler cleaning. The boilers are of the latest smoke-consuming type and are automatically stoked and regulated —not one pound of fuel being handled with a shovel. Even the ashes are disposed of without inconvenience of any kind. They drop from the grate into hoppers which dump directly into gondola cars.

The rest rooms and lavatories for employes are modern and sanitary, and a deep well supplies an abundance of pure, soft water.

The Great Northern's New Passenger Terminal at Minneapolis.

THE new $2,000,000 Great Northern Railway station in Minneapolis, Minnesota, which was opened for service January 22d, is the final word in modern model terminal construction. It stands on the river-front facing Hennepin avenue. The station is built according to the following general arrangement:

Main building with entrance on street level; waiting room, 62 x 155 feet and concourse 252 x 50 feet, on street level, with stairways and elevators leading to train platforms.

Twelve through tracks served by six platforms with "butterfly" type train sheds.

Overhead trucking gallery for handling baggage, mail and express, with elevators leading to all platforms at far end of station, so that baggage trucks are never in the way of passengers. These baggage trucks are driven by electric power and they are rubber tired, which will make the handling of baggage almost noiseless.

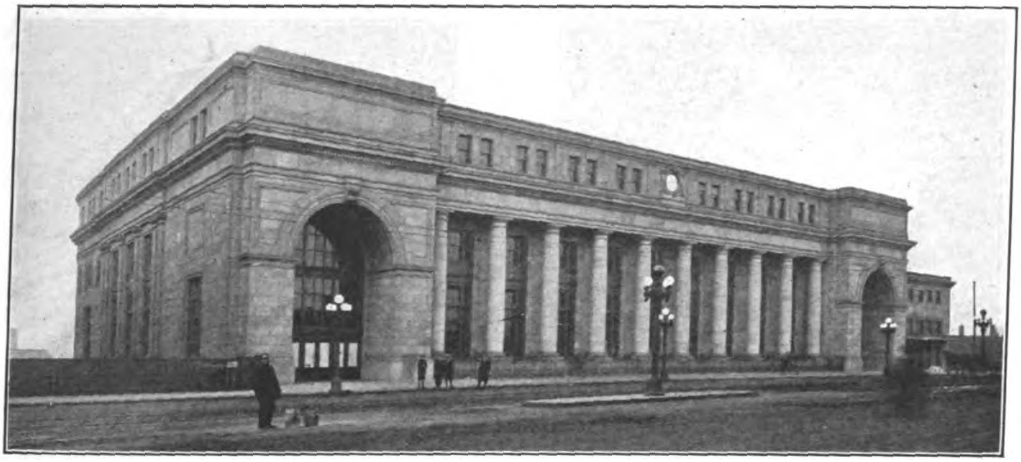
Mail and Express Building on site of old station (across street from station) the two connected by trucking galleries. This makes a terminal a quarter of a mile in length, the tracks extending under Hennepin avenue.

Power house at north end of the station yard and connected to the main buildings by an overhead "pipe gallery."

The mail and express building is now being built on the site of the old station, razing of which was begun the moment the new station went into service. This new building will be 300 feet in length, facing on High street and Hennepin avenue.

Six roads use the new Great Northern station: The Great Northern, Northern Pacific, Great Western, Chicago, Burlington and Quincy, Chicago and North Western and the Chicago, St. Paul, Minneapolis and Omaha.

The exterior of the new station is of tooled Kettle River sandstone from the quarries in Sandstone, Minn. The trucking galleries and stairs to the train platforms are of reinforced concrete construction. The power house and stack exterior are of brick. The only wood used in construction was in doors and narrow casings. Entrance and inner vestibule floors are of art marble tile. The walls are wainscoted with Tennessee marble. Door frames and booths around the waiting room are of ornamental cast iron. The women's retiring room has an art marble floor, with wainscoting of mottled gray Vermont marble. The smoking room has DeSmet marble cement floor tile, with Tennessee marble wainscoting and the



FRONT VIEW OF THE GREAT NORTHERN'S NEW PASSENGER TERMINAL AT MINNEAPOLIS.

dining room (on second floor) has a marble tile floor and Vermont marble wainscoting. On the second floor are the offices of the chief train dispatcher, his assistants, division superintendent and station officials. The third floor is to be used for storage purposes.

A novelty in the new Great Northern station is the ventilation of the big building. Water washed air is poured into the waiting room by means of enormous fans, while at the same time the vitiated air is removed by exhaust fans, and the temperature is kept even. During the summer the air will be cooled to a refreshing temperature by ice and pumped into the station at the rate of 35,000 feet a minute.

The main waiting room and train concourse are lighted by large ornamental chandeliers with tungsten units. In the new depot, Minneapolis people are given their first sight of recessed lights at the base of all stairway landings, minimizing mis-steps in going down these stairways.

The electrical equipment of this new Great Northern station is the finest in the Northwest, as well as the most extensive. More than eleven miles of galvanized iron conduit was used, and more than 25 miles of rubber covered wire. All of the wire used in this installation is of a quality better than the standard adopted by the National Board of Underwriters, the insulation being 30 per cent pure Para rubber.

More than 500 switches are used for controlling the various lighting circuits in addition to which there are a number of remote control switches for controlling groups of lights from various remote locations in the station. All of the remote control points have small lamps back of a bull's-eye lense to indicate if the lights located at a remote point are burning, or are cut off.

The power house, for furnishing the light, heat and power to the station, is located approximately 1,000 feet north of the building, the wires for supplying light and power and the steam for operating pumps and for heating purposes being carried through an aerial passage-way connecting the two buildings.

The generating plant consists of two simple and one compound engine being directly connected to two 250-kilowatt and one 350-kilowatt direct current 220 volt generators, making a total of 850 kilowatt, or approximately 1,200 horsepower. The switchboard for the control of this machinery consists of a 6-panel slate board 15 feet long, located along the west wall of the engine room. This is equipped with all the latest instruments for determining the voltage of the generators, the load under which they are operating, and the total amount of current supplied to the building during any given interval.

All of the electrical equipment, including generators, switchboards, panel-boards, conduit and wiring, was installed by the Minneapolis Electric Equipment Company.

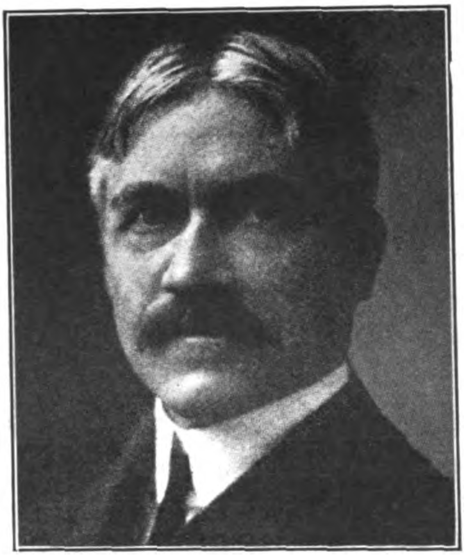
Interstate Commerce Commission

President Wilson Fills Vacancies on Commission.

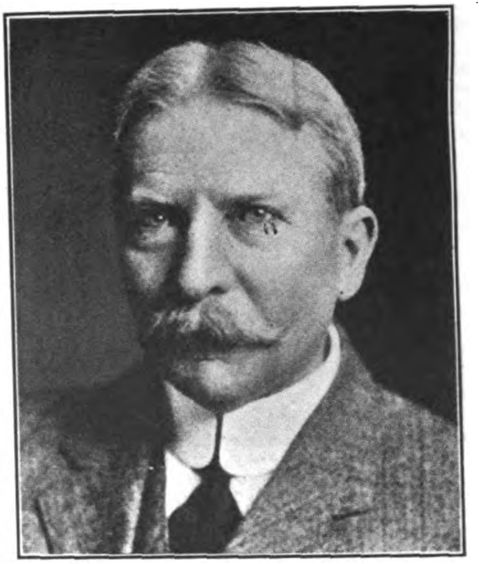
PRESIDENT WILSON has filled the two vacancies on the Commission by appointing Henry Clay Hall, of Colorado, and Winthrop M. Daniels, of New Jersey, to these important positions.

Mr. Daniels has for the past three years been a member of the Board of Public Utilities of the State of New Jersey and for more than twenty years, he was Professor of Political Economy of the Princeton University, of which President Wilson was president. Mr. Daniels was born at Dayton, Ohio, in 1867, and graduated from Princeton in 1888. When Mr. Wilson became Governor of New Jersey in 1911, he appointed Professor Daniels to membership on the Board of Public Utilities of that State, which position he has held until his present appointment. He is the author of "The Elements of Public Finance," and has lectured considerably on this question and upon railway economics.

Henry Clay Hall, the other commissioner appointed by President Wilson, was born in 1860 in New York City. He graduated from Amherst



WINTHROP M. DANIELS.

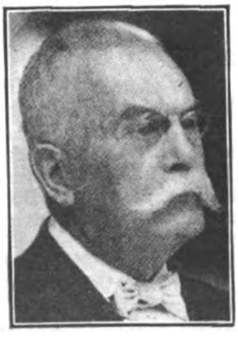


HENRY CLAY HALL.

College in 1881 with the degree of A. M. and from Columbia Law School in 1883 with the degree of LL.B. He was admitted to the practice of law in New York in 1883. From 1885 to 1892 he practiced law in Paris, France, and during part of this period from 1888 to 1892, he was also counsel to the United States Legation. Upon returning to America, he located in Colorado Springs, Colo., and later became general attorney for the Arkansas, Louisiana and Gulf Railway. He was also general counsel for the Colorado College at Colorado Springs and many other corporations. Mr. Hall was elected Mayor of Colorado Springs in 1905, which office he held for two years. He has lectured on law at Colorado College and was president of the Colorado State Bar Association from 1911 to 1912.

Frederick F. Shaller, who has been appointed signal engineer of the safety appliance division of the Commission, was born in Massachusetts in 1872. He is a graduate of the Massachusetts Institute of Technology, having completed an electrical engineering course at that institution. He then became engaged in electrical construction work and took a position with the Boston and Albany, being engaged in signal work in various capacities from daughtsman to foreman of construction. In 1902, he became assistant signal engineer of the Lake Shore and Michigan Southern and for the two following years, was employed in engineering work connected with the first installation of continuous automatic block signals on the Lake Shore. Since 1904, he has been employed in the engineering department of the Hall Switch and Signal Company.

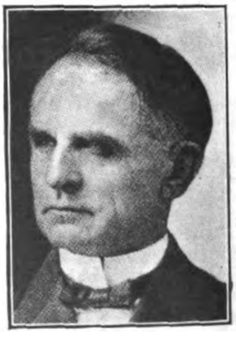
James E. Howard, who has been appointed engineer-physicist on the safety appliance division of the Commission, was born in Massachusetts in 1851. In the early 70's he was employed as civil engineer for the State of Boston, and in 1873, became engaged in engineering work in connection with the location and construction of the St. Paul and Pacific now the Great Northern. From 1874 to 1879, he was employed at Chicopee, Mass., as a mechanical engineer in the construction of testing machinery and engaged in conducting experiments connected with the testing machines now at the Watertown arsenal. In 1880, he became engineer of tests of



JAMES E. HOWARD.

ARTHUR BENTON PUGH.

F. F. SCHALLER.



ORVILLE F. BERRY.

that arsenal and from 1910 until his present appointment, he has been employed as engineer-physicist of the Bureau of Standards at Washington. Mr. Howard is a member of the American Society for Testing Materials and has also been given the honorary degree of Master of Science by Dartmouth College.

Arthur Benton Pugh has been appointed examiner-attorney for the Commission. He was born in Virginia and is a graduate of the University of that State, having been admitted to the bar in 1878. In 1897 he was appointed assistant attorney for the Interior Department at Washington and was special assistant to the attorney-general of the United States from 1906 to 1910. Mr. Pugh was appointed attorney to the Interstate Commerce Commission in September, 1910, which position he held at the time of his recent promotion.

Orville F. Berry, of Illinois, has been appointed examiner-attorney for the Commission. He was born in 1852 in Illinois, and since 1876 has resided in Carthage of that State. He was admitted to the bar in 1877, and in 1884, was elected Mayor of his own city, and served as such ten years. In 1888, he was elected to the State Senate and was a member of that body for twenty years. From 1896 to 1900, he was attorney for the State Insurance Department of Illinois and from 1900 to 1904, acted as special attorney for the State Department of Justice. In 1909, he was appointed chairman of the Railroad and Warehouse Commission of Illinois and served in this capacity until his recent appointment to the Interstate Commerce Commission.

R. D. Rynder.

R. D. RYNDER has been appointed chief examiner for the Commission. He was born at Altoona, Pa., July 3, 1882, and was graduated from the High School at Erie, Pa., in 1898. After doing clerical work for several years he entered the Indiana University at Bloomington, Ind., and completed the academic course in the spring of 1904. In the same year he obtained a clerkship, by competitive examination, in the Civil Service Commission, at Washington, and on December 5, 1904, was transferred to the Interstate Commerce Commission as clerk in the office of the assistant secretary of the Commission, Mr. Decker. After a few months he was appointed chief clerk of Mr. Decker's office; and on July 1, 1907, was appointed private secretary to the chairman of the Commission. While holding these positions he studied law at the National University, and was graduated in the spring of 1908, receiving the medal awarded for the highest standing during the course. On July 1, 1910, he was appointed attorney and special examiner for the Commission. In 1911, 1912 and 1913, he acted as a member of the Commission's Board of Review, Board of Suspensions, and Board of Reference. In his new position of chief examiner he has general supervision of the assignment of cases for hearing and of all the legal work of the Commission, except that performed by the Commissioners personally, and the trial in courts of suits to set aside or annul orders of the Commission, which is conducted by the solicitor of the Commission.

R. D. RYNDER.

J. Beaumont, signal engineer of the Chicago Great Western, has been appointed senior signal engineer, board of valuation engineers, Interstate Commerce Commission, for the third district, with headquarters at Chicago, effective February 1st. Mr. Beaumont was born in Staffordshire, England, August 10, 1874, and came to the United States when fourteen years of age. Later he began railway work as machinist's apprentice in the Mott Haven shops of the New York Central & Hudson River and in three years became a journeyman machinist. Subsequently he was stationary engineer in the Grand Central Station, New York, resigning in 1898 to enlist in the army for the war with Spain. In 1899 he went to the Standard Railway Signal Company, being made foreman in 1901 and general foreman the following year. He returned to railway service in 1904 as assistant supervisor of the Western division of the New York Central, and a year later was made supervisor at Buffalo. He then became connected with the General Railway Signal Company in 1906 as assistant engineer of sales and installation, and the next year was made supervisor of interlocking of the Atlantic Coast Line. In 1908 he went to Panama as signal engineer of the Panama Railroad, and two years later he returned to the United States to become signal engineer of the Chicago Great Western, which position he now resigns to become senior signal engineer with the board of valuation engineers, as above noted.

The Rate Advance Hearings.

AT the opening on February 19 of the hearing of protests against the proposed higher rates on plaster, Commissioner Harlan made the following statement:

The action of the Commission on Monday last in further suspending, until September 12, the proposed increased rates involved in this case seems to have been misunderstood by those not familiar with the practices of the Commission. It may be well, therefore, for me to say that the order then entered has no significance beyond the fact that the case is not yet ready for decision. Recognizing the public importance of an early disposition of the problems before us here, the carriers, shippers, and the Commission are using every effort to bring the inquiry to an early conclusion, and there is reason to think the record on the main issues in the case may be closed and the arguments had in time to enable the Commission to dispose of those questions before the summer recess.

There is another matter that I wish to speak of this morning, and in order that it may be clearly understood by those who have not been able to follow the progress of our hearings, it may be well again to explain that the Commission has before it here two subjects of inquiry, namely:

(a) Are the present revenues of the carriers adequate?

(b) It not, how may they be supplemented?

With respect to the first of these issues, the carriers have already offered much testimony, but their witnesses have not been cross-examined, nor have the investigations by the Commission on that question been completed. We are also advised that certain shipping interests will submit important testimony touching the adequacy of the present revenues of the carrier. In aid of an understanding of the first question and of a proper solution of the second question, the Commission, as I explained at a recent hearing, has also addressed certain inquiries to the carriers which they have not yet been able fully to answer. Pending the preparation by the railroads of their replies, we have been hearing the protests of shippers agaist the proposed increases in the rates on certain particular commodities in which they deal or are otherwise interested. A hearing was also had on February 12, 13, and 14 regarding the propriety of a charge by carriers for certain special services that are now performed by them without charge in addition to the published rate. At that hearing testimony was offered by the railroads and large shippers regarding the following free services:

1. Trap or ferry car service.
2. Placing cars for loading or unloading on sidings serving industries.
3. Free lighterage.
4. Tunnel deliveries in Chicago.
5. Storage free and at unremunerative rates.
6. Reconsignments and diversions in transit.
7. Free holding of equipment under load at New York terminals beyond the customary free time allowed at other terminals.

A hearing will be had in Washington on February 27 and 28 to consider further the question of making a charge for spotting cars for loading and unloading on private spur and side tracks, for the trap or ferry car service, and for the tunnel and lighterage services in Chicago. It is expected that the final arguments upon these subjects will be had before the full Commission at Washington on March 16 and 17.

Our records disclose that there are some 25,000 private spur tracks and sidings in the territory east of the Mississippi River, and, manifestly, it is neither desirable nor possible to examine in detail each one of these operations. But typical examples of the different classes of private spur and switch tracks will be helpful in enabling the Commission to determine:

1. The propriety of a charge by carriers in addition to the rate, for the spotting and trap car service.
2. The amount of the charge and the manner in which it should be assessed.

While the general conditions in this regard at Chicago were outlined at the recent hearing, further testimony is desired, and the commercial interests of Chicago that have already participated in these proceedings and others that desire to do so, are requested to come together promptly in conference among themselves in order that at the approaching hearing the Commission may have further details respecting private spur and switch tracks by means of illustrative cases. The commercial interests of Detroit, Cincinnati and Indianapolis are also requested to come together in conference in order that they may be represented at the next hearing by witnesses who will be able, by means of illustrative cases, to advise the Commission of the conditions existing at those places. So far as the time permits representatives of other cities will be heard; valuable testimony has already been given bearing upon the situation at Buffalo. The Commission will itself undertake, through its examiners, to make an appropriate record of conditions at smaller towns and villages in the territory involved.

The conditions developed in this way in respect of these matters at Chicago, Cincinnati, Detroit, Buffalo and Indianapolis, together with a report of typical spur-track conditions in villages, towns and the country districts, will probably be sufficiently illustrative as to give the Commission a broad view of the general conditions in this regard throughout the territory east of the Mississippi River.

At the hearing on February 27 and 28 none of the services to and from and within industrial plants of the general character described in the Industrial Railways Case will be further considered. But throughout the territory the spotting service is performed by the carriers to coal yards, lumber yards, elevators, warehouses and factories, by placing cars for loading and unloading at particular points on the private spur tracks leading to them, in accordance with the requirements of the shipper. There are some complex spur track situations, properly coming within the scope of the hearing, such as the spur tracks of Larkin and Company at Buffalo, fully described at the hearing of February 14. There, as it appeared, four spur tracks extend into a large storage warehouse of that company, on the ground floor of which are the loading and unloading platforms. Each of these tracks will accommodate 15 cars. One is used exclusively for inbound freight, the other three being used for loading outbound freight. The tracks are drawn by the carriers at a definite hour every morning, after which they are again filled with empty cars. For the purposes of the hearing this and similar situations are not to be regarded as industrial plant railways, but simply as private spur tracks and switch tracks. Less complicated examples of private spur tracks are to be found throughout this territory, including the simplest form in the small villages and in the country districts. Illustrative cases of these various classes of tracks, upon which the carriers perform the free spotting service, will afford the Commission an ample record upon which to set for argument the question of the propriety of an adequate charge by the carriers for the service.

Information is also desired at the hearing as to what the amount of the charge should be, if any is to be imposed. The suggestions already made to the Commission range from 50 cents a car, in cases where the operation is simple, the spur track short and the district not congested, to $2.50 a car in cases where the congestion exists and the service is extensive. The Commission desires to be fully advised at the hearing on this point.

The matter of making a charge for placing cars for loading on spur tracks leading to coal mines and coke ovens will be taken up for consideration as a separate matter, and March 4 and 5 have been reserved for hearing testimony on this subject. At this time testimony will also be heard touching the propriety of the cancellation by carriers of allowances and divisions to the industrial roads of coal companies and operators.

March 6 and 7 have been reserved for hearing testimony respecting the proposed increase in coal rates, and March 9, 10 and 11 have been set aside for hearing testimony upon the general objections to the proposed general increase in rates, and particularly for hearing representatives of the State railroad commissions.

That part of the case that pertains to the proposed increases in the lake-and-rail rates will be heard at Washington on March 12, 13 and 14.

Separate hearings will be assigned to consider lighterage and other special services at New York City and New York Harbor, and concerning reconsignments and diversions in transit, free storage, etc.

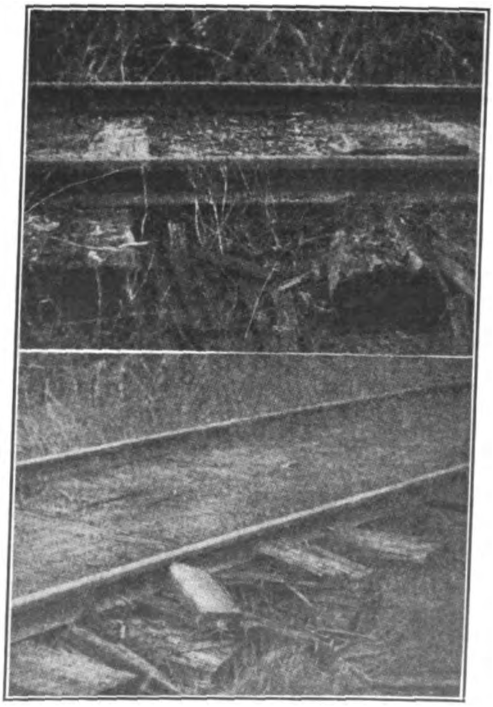
Lower Picture Represents the East End and South Side of Coach No. 233 After the Accident.

Results of Recent Accident Investigations.

THE Commission through its division of safety appliances, has recently concluded a number of investigations with reference to wrecks which have occurred in various sections of the country. On November 13, 1913, there was a derailment of a passenger train on the Central of Georgia Railroad, about four miles east of Clayton, Ala., resulting in the death of nine passengers and the injury of 389 passengers and one employe. The line on which the accident occurred is of a single track character and extends between Eufaula and Ozark, Ala., a distance of sixty miles. At the place of the derailment, the track is on a fill about twenty-five high. The three rear cars left the track and as the result of the derailment, the rear platform, a portion of the end sill and coupler, and draught timbers were torn from the second car in the train and remained attached to the third car. The third and fourth cars were derailed on the south side of the track torn from their trucks and thrown down the embankment. The following illustrations give some idea of the damage wrought.

The investigation shows that while the direct cause of the accident was a broken rail, bad track conditions and speed inconsistent with safety were materially attributed to the causes, both to the derailment and of the disastrous results. The track in the vicinity of this accident was in a deplorable condition as indicated by the two accompanying illustrations. According to the report, the track has also outlived its usefulness and many broken rails were repaired in such a way as to indicate that material was not furnished for making repairs in a proper manner. To quote from the report:

"When rails of this character are used on rotten ties, without ballast, and with an inadequate force of men to control the track and



Conditions of Track West of the Accident.

perform necessary work, as this investigation shows was the condition existing on this branch, accidents of this character may be expected to occur."

The chief inspector of Safety Appliances has also issued his report regarding the derailment of a freight train on a southern railway near Oyama, N. C., which occurred on March 31, 1913, and which resulted in the death of three employes and the injury of a trespasser. The engine tender and sixteen cars were derailed on the south side of the track, eleven cars were destroyed and the track was torn up for a distance of 330 feet. The speed of the train at the time of the derailment was from 25 to 30 miles an hour which was within the speed restriction for freight trains in effect on this division. Approaching the scene of the accident from the East, there is a two per cent curve to the south, 2,300 feet long, followed by a tangent 2,700 feet in length. Following this tangent is a one per cent curve on the north, 5,400 feet in length.

The derailment occurred about 1,122 feet from the east end of the tangent, 300 feet from the foot of the descending grade on a fill five feet high on the south and two and one-half feet high on the north. It was caused by a broken rail on the south side of the track. The rail was broken in eight places, the shortest piece being about seven inches long and the longest piece sixteen feet two and one-half inches. The engine of the train weighed 197,750 pounds with 176,650 pounds on the driving wheels. The rail which was fractured was 33 feet long, and weighed 30 pounds to the yard, was rolled in November, 1904, and laid in the track in January, 1905.

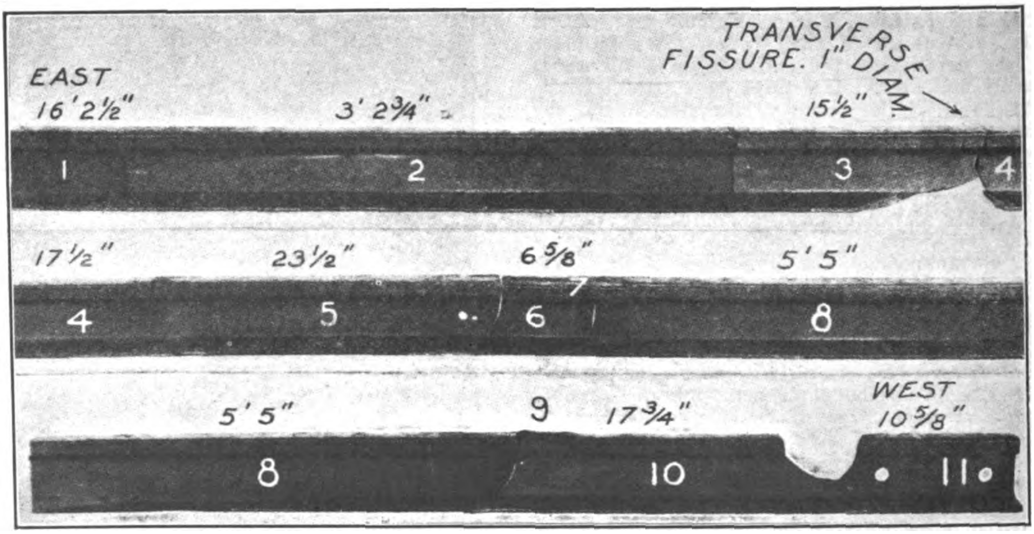
An examination into the cause of the breakage was made by the Bureau of Standards of the Department of Commerce, the examination being personally conducted by Mr. James E. Howard, enginer-physicist of the Bureau of Standards. The first break in the rail was found sixteen feet two and one-half inches from the east end, while the part of the rail west of this fracture was broken in nine pieces ranging from 6⅝ inches to five feet five inches in length. From the appearance of the fractures and the battered end of the pieces, it is believed that the first break occurred either between pieces number two and three or between pieces number three and four, as shown in the accompanying illustration. A transverse fissure one inch in diameter, was found in the fracture between pieces three and four and that fact, together with other evidence brought out by Mr. Howard's investigation, indicated that this fracture was the first one to be formed.

Mr. Howard points out that transverse fissures are progressive in their character and development. They have been observed at different stages in their growth from 0.30 inches in diameter to a maximum of 2½ inches. The material and locality in which they exist have been defined. They have been found only in steel rails, where they commonly are developed on the gauge side of the head, or over the web. In their development from a minimum to a maximum diameter the extension takes place while the rails are under service condition in the track.

Furthermore, Mr. Howard calls attention to the fact that—

The rate of development, however, of a transverse fissure should in general be an accelerating one, since the resistance of the rail diminishes as the fissure extends.

It is a question of interest whether an effect caused by an excessive load, but not immediately resulting in actual rupture, is further accentuated by the application of lesser loads; that is, whether the effect of an overload coming from the drivers of the engine would be further increased by the lesser wheel loads of the train. Laboratory tests on the effects of repeated stresses have shown, however, that many million repetitions of a lesser load may be applied to a steel bar without causing rupture, while substantially the normal number of repetitions of a maximum load will thereafter effect a fracture.



Showing the Various Breaks Which Occurred in the Rail in the Accident at Oyama, N. C., on March 31, 1913.

This is so vital a feature in the use of railway material that confirmatory data are desirable to acquire from independent sources. Provided these indications are trustworthy, it follows that the limit of endurance of a steel rail is not necessarily measured by total tonnage, but rather by the number of repetitions of high wheel loads to which it is exposed.

* * * * * * * * *

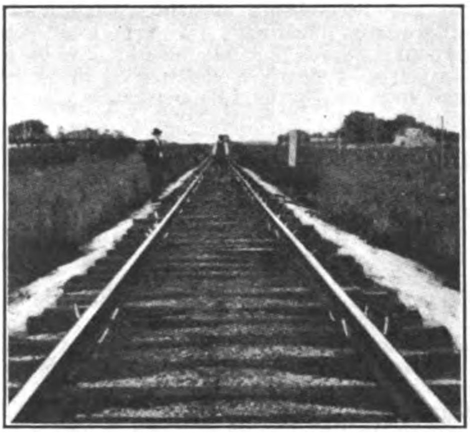
Frequent rail fractures are regarded as sufficient warning that railway practice is approaching the limit of endurance of rail steel.

The facts disclosed by the investigation of this derailment emphasize the statements made in the report regarding the derailment on the Louisville & Nashville Railroad, near Hay's Mill, Ala., where it was stated that the combined bending stresses and intense wheel contact stresses which attend the service conditions of steel rails appear to be the cause of the formation of these fissures. The insidious character of these fissures and their menace to safe travel by rail justify the conclusion reached that there is an absolute necessity of making a complete investigation of track and wheel conditions for the purpose of determining the effect thereon of the recent types of locomotives and cars with their greatly increased wheel loads.

Another report recently issued by the Chief Inspector of Safety Appliances covers his investigation of a derailment which occurred on the St. Louis and San Francisco Railroad near Chelsea, Okla., on October 29, 1913, to a passenger train, resulting in the death of the engineman and the injury of the fireman. The forward tender trucks of the locomotive with the first wheels derailed ran along the roadway until the passing track switch was reached and at this point the derailed truck came in contact with the switch and broke the frog and one throw rail. The engine and tender continued westerly on the main line for a distance of about 200 feet before turning over to the right. The cars making up the train were diverted to the switch and to the passing track which was on the left hand side of the main track. The first three cars were derailed but remained upright.

Careful examination of the trucks, wheels, center castings, etc., of both the engine and tender showed nothing which could have caused the derailment. The report states, however, that examination was made of the track from a point one-half mile east of the point of derailment to a point nearly one-half mile west of Chelsea, a total distance of about one and one-half miles. It is further stated, that the track conditions disclosed by this examination were extremely bad; in fact they were such as to constitute a dangerous menace to the trains and safety. Rail joints were found improperly secured and ballast was insufficient or improperly distributed.

To quote from the report: "Bridge number 379.6 was located nearly 2,700 feet west of the station at Chelsea. Examination of the track for a distance of seven rail lengths each of this bridge showed that out of a total of 134 ties, 78 were defective, one rail length having sixteen defective ties out of nineteen ties in use. Of the sixteen defective ties under this rail, fifteen were successive ties. In this same distance of seven rail lengths, there were 142 loose or missing spikes and 126 spikes which could be removed by hand, a total of 268 spikes out of 536 in use which had practically no holding power."



SECTION OF THREE RAIL LENGTHS FROM WHICH NINETY-SIX SPIKES WERE REMOVED BY HAND.

The report contains other examples of bad road bed conditions in this vicinity, but the above quotation and the accompanying illustration are sufficient to illustrate the Commission's statement regarding the poor condition of the right-of-way at this point. In closing his report, Chief Inspector Belnap stated that "while the cause of this accident was not definitely determined, it is believed that the track conditions were not safe for the operation of trains at the speed permitted, and that these conditions caused the tender of the locomotive hauling this train to rock back and forth until finally the forward wheels were derailed.

"The existence of track conditions such as was disclosed by this investigation constitutes a dangerous menace to the traveling public, and vigorous measures toward remedying these conditions should be taken at once."

Report on Safety Appliances.

H. W. BELNAP, chief inspector of the Commission, has issued his annual report containing a review of the work of the safety appliance division during 1913. During the year twice as many cars were inspected as in 1912. Explaining the tabular setatements in the report, Mr. Belnap says.

"Defects to visible parts of air brakes constitute nearly 50 per cent of the total number of defects reported. This is a condition which should not be permitted to exist. Practically 50 per cent of the defects reported under the classification of 'uncoupling mechanism' consist in broken uncoupling chains. These chains may be quickly and readily repaired at any time and place, and the proportion of such defects to the total number of defects reported is inexcusable. The number of uncoupling devices which have no chain has greatly increased in recent years; their general adoption will effect a proportional diminution in the aggregate number of defects. The Master Car Builders' Association has acted with a view to the adoption of a standard coupler, and it is to be hoped that at its next convention it will recommend a standard.

"Under 'running boards,' out of a total of 6,912 defects reported 4,265 consisted in loose braces.

It has also been found in many instances that drive screws or fluted nails have been used to secure running boards to saddle blocks. The use of such material is clearly a violation of the standardization order of the Commission and should be discontinued.

"The principal defect, numerically, in the matter of handbrake equipment continues to consist in the absence of the cotter key or ring from the bottom of the shaft. In most cases these keys seem never to have been applied. Hand brakes are frequently found inoperative by reason of shifting of the contents of cars. The Act of April 14, 1910, requires all cars to be equipped with efficient hand brakes.

"The record of terminal or standing tests of air brakes made by our inspectors shows that there are a number of instances in which the percentage of operative air brakes has been found to be below the minimum of 85 per cent prescribed by the Commission's order of June 6, 1910. The importance of these tests as an element of safety cannot be overestimated. At many terminals the only air brake test made by the carriers consists merely in the ascertainment of whether or not the air is working throughout the train line. Such tests provide no adequate information as to the efficiency or otherwise of individual brakes, and trains are not infrequently permitted to leave their terminals with insufficient braking power. The interval of five or ten minutes necessary to make a standing test is scarcely to be counted in comparison with the proportional increase in the measure of safety resulting from such a precaution.

"The charge that our inspectors have delayed traffic by the making of terminal tests is not well founded, for the reason that such tests are invariably completed within a few minutes. The real occasion for delays to traffic has in most cases been the situation disclosed by such inspections. Our inspectors will hereafter make standing tests of every train that leaves a terminal while they are present. This may, of course, occasion slight delays to traffic, but the tests will be made as expeditiously as possible, and if the efficiency of individual brakes is maintained at a proper standard the time consumed in making tests will be inconsequential.

"The Commission's standardization order was issued March 13, 1911. The period of limitation in which locomotives of all classes were to have been equipped comfortably to the provisions of this order has already expired, while the three-year period as to passenger equipment will expire on July 1, 1914. The progress in the equipment of passenger cars is such as to warrant the belief that the requirements of the Commission in this respect will be observed within the time prescribed. The proportion of freight cars, however, already equipped, as compared with the total number of such cars to be equipped, is still unduly small, and unless this work of equipment is very materially expedited it will not be completed within the limit fixed by the extension order of March 13, 1911. I therefore renew my recommendation that the Commission require the carriers to report semiannually the progress hereafter made in the equipment of freight cars in service on July 1, 1911.

"Inspectors are required not only to inspect safety appliances, to procure evidence to be used as the basis of prosecutions under the safety appliance act, and to attend court in the capacity of witnesses in such proceedings, but also to make terminal tests of air brakes; to examine locomotive ash pans; to inspect railway mail cars; to investigate accidents; to investigate and report on numerous informal complaints; and to confer with the mechanical officials of railways relative to the proper equipment of cars. The work performed by the various inspectors during the fiscal year just closed presents a creditable showing.

"At the present time there are in service approximately 2,250,000 freight cars, 58,000 passenger cars, and 63,000 locomotives subject to federal inspection, and in order to examine in any one year more than a very small percentage of the aggregate equipment it is obvious that the number of inspectors should be increased. It is therefore respectfully recommended that additional inspectors be appointed. * * *"

Table No. 1 shows that during the fiscal year 738,665 freight cars were inspected, of which 54,055 were found defective. The lists showing the items making up this total fill two pages.

Table No. 2 shows defects on each individual railroad, but includes only those roads on which 500 or more cars were inspected during the year, the defects being divided into 16 classes. This list contains the names of 135 roads.

Table No. 3 shows the names of 150 roads on which terminal tests of air brakes were made, the total number of trains tested being 1,040. The number of air cars in these trains was 29,637, of which 1,610 had brakes that did not apply. On 397 cars, brakes were found with excessive piston travel.

Table No. 4 shows, by roads, the number of cars inspected, and the number found defective, on 119 representative roads, each year for five years.

Table No. 5 shows the total amount of penalties, exclusive of costs, paid by the railroads into the courts up to November 1, 1913, for violations of the laws relating to safety appliances, to hours of service and to ashpans. This list contains 250 roads and the combined total of the penalties is $480,962. The length of time covered by this table is not given, but it is to be borne in mind that prosecutions under the safety appliance act began a number of years before the hours of service act went into effect. The totals under the different heads are as follows: Safety appliance act, $319,400; violations in working time of trainmen, $120,662; telegraph operators, $21,400; failure to file reports, $14,500; ashpan act $5,000.

Railroads Desire to Retain Water Lines.

THE Commission received a number of petitions during February for relief from the operation of the Panama Canal Act, which requires interstate railroads to divest themselves of ownership or control of steamship and other water lines before July 1, 1914. Under the law the Commission is given discretionary powers as to what roads shall operate such lines, those which may be exempt from the Act, being the lines whose operations do not exclude, prevent or reduce competition. Among those who have applied for permission to continue their water lines are the Pennsylvania Railroad, Lehigh Valley, Southern Railway, New York, New Haven and Hartford, the New York Central and Hudson River, the Duluth, South Shore and Atlantic, Grand Rapids and Indiana, Michigan Central, Atlantic Coast Line, Delaware and Hudson, Norfolk and Western, Seaboard Air Line, Chesapeake and Ohio, Southern Pacific and the Central Pacific.

Actual Answers Taken from Examination Papers of Applicants for Positions with the Interstate Commerce Commission.

THAT many American citizens do not permit lack of knowledge to stand in the way of their efforts to procure a Government position with the attractive salary attached thereto, is evidenced by the replies given by many applicants to the questions found in the recent examinations held by the Interstate Commerce Commission for the purpose of procuring men to engage in the work of physical valuation. The following are copies of answers that appeared on some of the examination papers:

A. Common carrier is one who carries.

A. Common carrier is a vehicle which the railroads use for transporting passengers.

A. Carrier is a man at a town where there is no wagon delivery.

Q. If a rate is provided on a mixed shipment of different articles, and it is found to be higher than either the separate class or commodity rate on any or all of the articles specified, which is the lawful rate?

A. The low rate which gives the shipper the advantage.

A. The lowest rate on the article taking the highest rate, that is, if the rate provided for the shipment is higher than the class or commodity rate for the article taking the highest rate. If one article has both a commodity and a class rate, and the lower of the two is higher than the lower rate of any other article, that applies; but if another has both a commodity and a class rate, the higher of the two being higher than the lower of the first mentioned, that applies.

A. Proportional tariff is one in proportion to the shipment.

A. Classification is a diary of different articles in a class so that the carrier can realize a profit.

A. Classification is a list of articles designated as taking a certain class, segregating all articles from another.

A. Classification is freight rates.

The Principal classifications—Canadian, Ohio State and Interstate Official. Of course the Interstate is omnipotent throughout the United States, and it is the principal classificaion.

A. Combination fare is more than one person.

A. Joint tariff is where two classifications are shipped in one package or bale.

An expense bill is mending broken packages.

Exceptions to classification is where special conditions prevail, as where there is no derrick.

A. Demurrage charge is an overcharge.

Demurrage charge—it causes endless strife.

By absorption of switching charges is meant that it might spoil or leakage.

TRAFFIC.

Exchanging Mileage Coupons for Railroad Tickets.—For the convenience of passengers boarding its trains at Reading and Norristown, the Pennsylvania Railroad on January 19th, extended to those stations the privilege of exchanging mileage coupons for railroad tickets.

The new plan is this: Anyone intending to ride on a Pennsylvania Railroad train, and who owns a book of mileage coupons good on the Pennsylvania Railroad, can, if desired, take the mileage book to a ticket office and exchange the required number of miles for a ticket. In this way a passenger who prefers to use a ticket instead of a mileage book gets the benefit of the low mileage rate.

Rule on Free Passes in Pennsylvania.—The General Manager of the Pennsylvania Railroad has issued the following notice to employes:

"By general notice, dated November 29, 1913, officers and employes were advised that, under the terms of the Public Service Company Law of the State of Pennsylvania, the free transportation between points within that State of members of their families would not be permissible after January 1, 1914, and that the issue of passes covering such transportation after that date would consequently be discontinued.

"The Public Service Commission of the Commonwealth of Pennsylvania by its Administrative Ruling No. 1, has ruled that the granting by railroad companies of free passes to their officers and employes to be used for the transportation of dependent members of their families would not be regarded by the Commission as a violation of the provisions of the Public Service Company Law.

"This ruling will be accepted as affording protection against exaction of penalties for the issuance of passes to dependent members of the families of officers and employes, and the General Notice of November 29th last, is therefore annulled."

Co-Operating to Prevent Car Shortages.—To what extent shippers have co-operated with the railroads in their campaign to prevent car shortages by loading equipment to maximum capacity is shown by the figures issued by the traffic department of the Universal Portland Cement Company for 1913. This Company shipped 10,383,111 barrels of cement in 53,585 freight cars in 1913, as compared with 7,686,047 barrels shipped in 43,097 cars in 1911. The figures indicate a maximum loading of freight cars in 1913, which was not the practice in 1911. An average of 194 barrels were loaded in a car last year, the loading having been increased from 178 barrels in 1911. This increase in carload saved the use of 4,747 cars which would have been required additionally to move last year's traffic on the basis of the loading in 1911.

This industrial concern has reduced the number of cars required to handle an increasing business by loading the cars to capacity plus ten per cent. A campaign was conducted with the trade and selling forces of the company so that orders would insure maximum loading of cars.

Other shippers are carrying out the principles outlined for the prevention of car shortages, but the results obtained by the cement company on such a big scale have attracted special notice in transportation circles.

A New Plan for Stimulating Traffic on the Frisco.—A supply of individual business cards and prospective traffic cards have been furnished all passenger conductors on the Frisco, with a view to having them assist in the solicitation of business.

The individual cards bear the motto: "It will always be our desire to make your trip comfortable and pleasant on a Frisco train." The prospective traffic card bears the motto: "Let us have an opportunity to demonstrate to you that we can handle your carload and L. C. L. business to your entire satisfaction. Our service is strictly first class."

This plan of soliciting business is being tried out, based on the fact that passenger conductors are well acquainted with a large number of shippers and receivers of freight and are adding to their acquaintance daily.

When a conductor meets a prospective shipper on any one of his trips, he is to hand him one of his business cards as well as one of the prospective traffic cards, which he is asked to fill in—or the conductor may fill in this card for the prospective shipper—after which it is to be mailed to the superintendent of the division on which the conductor is employed. The superintendent in turn forwards the card to the proper traffic official or agent. It is necessary that the cards be mailed promptly at the end of each trip.

When additional cards are needed a requisition on the office of superintendent will bring a new supply promptly. A record of the number of cards turned in by each conductor is kept for comparative and other purposes.

Trade Possibilities with the Latin American Countries.—A circular which should prove of interest to shippers all over the country has been issued by the traffic department of the Missouri Pacific-Iron Mountain. The matter contained in the document is based on information furnished by Mr. H. C. Dinkins, Special Representative of the railroad, who some time ago was assigned the duty of visiting the Latin American countries and making a study of trade conditions and opportunities there.

This particular circular, which is one of a series to be issued along the same lines, deals principally with conditions in Chile and Argentine Republic, two of the countries visited by Mr. Dinkins, and gives much valuable first-hand information with reference to shipping facilities at the principal cities, the names of the foremost shipping and receiving agents, the more important articles of import and export and the commodities of which the different shipping concerns make specialties. The principal lines of industry are also set forth, as well as the natural resources of the countries. According to the report, the merchants and dealers of the South American countries are anxious for better service from the Gulf ports.

The trade of Argentina at present is controlled largely by Great Britain and Germany, although many big United States firms have representatives there.

Mr. Dinkins believes that the opening of the Panama Canal will enable the United States to do a much larger business with Chile, where the English have decidedly the better of the trade at present. Santiago, the capital of the country, has a populaion of 403,000, but most of the business is done through Valparaiso, the principal seaport. The latter has a population of 263,000 and most of the principal business houses in Santiago and other points are branches of Valparaiso concerns.

At present, financial conditions are bad in Chile, Peru and Bolivia and business in these three countries is largely at a standstill.

To Investigate Privileges of Plant Railways as Common Carriers.—One of the most sweeping investigations ever undertaken by the American Railway Association will be begun within a few days for the purpose of eliminating from membership in the organization every plant railway which has been representing itself as a common carrier.

Announcement has been made that more than 300 small roads will be included in the inquiry and that at least one-third of them probably will be dropped from the organization. This action will not only compel them to pay demurrage instead of per diem rates for the use of cars belonging to other lines, but also will prevent their officials from obtaining passes on various railroads throughout the country.

It is learned that the Illinois Northern Railway, owned by the International Harvester Co., the Pullman Railroad owned by the Pullman Co. and the Chicago & Western Railroad owned by the Dolese & Sheppard Co., were among the nineteen plant lines barred recently from participating in the per diem agreement of the Association.

ORGANIZATION NOTES.

Annual Dinner of Central Railway Club.—The annual dinner of the Central Railway Club which was held in Buffalo, New York, on Thursday evening, March 12th, proved to be a notable occasion. As heretofore, it was preceded by a reception in the parlor of the hotel affording members and their guests an opportunity to greet each other and enjoy a brief period of social pleasure with a renewal of old associations.

Among the guests were B. D. Caldwell, president of the Wells-Fargo Express Company and past president of the Traffic Club of New York; George A. Post, of New York, president of the Railway Business Association; D. I. Roberts, of New York, president of the United States Express Company; Major Charles Hine, former vice-president of the Southern Pacific Railroad and W. T. Noonan, of Rochester, president of the Buffalo, Rochester and Pittsburgh Railroad. Addresses were delivered by Mr. Post, Mr. Roberts and Major Hine. Mr. Caldwell was toastmaster.

Second Annual Meeting of the Chamber of Commerce of the United States.

THE second annual meeting of the Chamber of Commerce of the United States was held in Washington on February 11th, 12th and 13th. Charles A. Prouty, of the Interstate Commerce Commission spoke on the valuation of railroads and in fact, the program as a whole, was of interest to all transportation men, as two entire days were devoted to the various phases of corporation control that have been brought to the front by the trust legislation of the past year and by the president's message to Congress on January 14th. William B. Wilson, secretary of Labor also addressed the meeting on "The Relations of the Department of Labor to Industries and Commerce."

Trust legislation was discussed under the head of the following questions:

1. Concentration of industry in the United States—What constitutes
   (a) Unreasonable restraint of trade?
   (b) Unfair competition?

In what respect does the Sherman law require definition?

2. Should holding companies be abolished?—Should interlocking directorates be prohibited?—Should persons or corporations be permitted to own control of competing corporations which between them do more than half the business in a particular line?

3. What should be the rights and privileges of private parties—
   (a) In intervention in Government action under the Sherman Law to prove damages—
   (b) In invoking equity powers to restrain violations of the Sherman Law—
   (c) Under the statute of limitations: Should the statute be extended in their interests so as to run from the date of the entry of judgment in a Government suit?

4. What should be the functions of a Federal Interstate Trade Commission:
   (a) Administrative powers to restore competition and enforce the Sherman Law and new laws defining its scope—
   (b) Quasi-judicial powers of legislation—
   (c) What requirements as to publicity should be enforced?

5. Is the trust form of organization industrially efficient?

Among the speakers were President Charles R. Van Hise, of the University of Wisconsin; Louis B. Brandeis, of Boston, Mass.; Frederick P. Fish, former president of the American Telephone and Telegraph Company; Victor Morawetz, of New York City; Professor Henry R. Seager, of Columbia University, New York and Henry R. Towne, president of the Yale and Towne Manufacturing Company, and former president of the Merchants' Association of New York City.

Annual Dinner of Traffic Club of Pittsburgh.

THE twelfth annual dinner of the Traffic Club of Pittsburgh, will be held on Friday evening, March 27th. The annual affair of this pioneer club has heretofore only been limited by the capacity of the largest hotel and banquet hall in Pittsburgh, but in order to accommodate many desirable guests who through lack of space have not been able to attend other annual affairs, the committee has arranged for the Memorial Hall, using both banquet and concert halls. With men of national note for speakers, it is announced that arrangements are being rapidly completed and will result in a function surpassing anything of like character given by this Club.

Annual Dinner of Newark Traffic Club.

NOVEL and unique ideas were introduced at the fifth annual dinner of the Traffic Club of Newark, N. J., held on Saturday evening, January 24th. The entrance to the banquet room, known as "the special dinner car" was attended by uniformed railroad gatemen and tickets were inspected upon entrance, the guests finding their places by means of seating lists arranged in form of time-tables. Railroad porters, messenger and newsboys were on hand to anticipate the wants of those present and introduction to the many songs was sounded by a locomotive bell, which rang at intervals.

To further the scheme of good fellowship between carriers and shippers, a miniature electric railway held sway on the guest table, where amusement was gathered in its efficient exhibition.

The Dinner Committee composed of A. Preston Jump, chairman; W. A. Ruehl, W. W. Finley, Jr., and W. John Creighton, was rewarded for its untiring efforts both from an entertaining and intellectual standpoint, their selection of speakers alone made the evening meet with the hearty approbation of all present.

Mr. A. V. Hamburg, President of the Board of Trade of Newark, in his address "The Commercial Growth of the World" drew deep from the records of history and came slowly forward to the present period, where education was bringing the desired results of efficiency.

Mr. Jackson E. Reynolds, General Attorney of the Central Railroad of New Jersey, spoke at great length on the difficulties with which railroads contended.

The speaker called attention to legislation aimed at railroads wherein from 1910 to 1913, ten anthracite roads had increased their property investment by $300,000,000 and as a result of this investment the gross income of the concerns increased to $84,000,000. However, it was found that operating expenses had risen to $85,500,000 or $1,500,000 in excess of additional earnings.

The proposed National Securities Commission, if created, meant further difficulties for the railroads through the various State Commissions in issuing certificates, argued Mr. Reynolds, and if the companies were compelled to meet the demands of these various bodies, that 'ere long they would be unable to market their securities as the investing public would refuse to subscribe.

Mr. Ivy L. Lee, Executive Assistant, Pennsylvania Railroad, concluded the addresses of the evening, touching strongly on passenger facilities of Newark and removal of grade crossings. The management of the Pennsylvania Railroad, he said, had a definite purpose as soon as feasible, to build four tracks across Market Street and to rebuild the present station with a modern building, providing high level platforms between the inner tracks. This, however, could not be done immediately, as financial skies are not sufficiently clear to justify a prudent railroad in any large expenditures just now.

To remove all grade crossings in New Jersey, Mr. Lee stated, it would cost his road $60,000,000 there being just 1,200 such crossings still to remove and in his opinion this expense should not be borne entirely by the railroad. Public service corporations, on motion of municipality, a railroad, or on a commission's initiative, should have the right to designate such grade crossings as should be removed, and should have power, after hearing all parties in interest, to apportion the cost of such improvements with due regard for the interests of all parties concerned.

This dinner was the largest ever held by the Club, being attended by one hundred and sixty guests, among whom were the following: C. A.

Swope, General Eastern Agent of the Louisville & Nashville Railroad; A. Preston Jump, Freight Agent, Carnegie Steel Company; R. J. DeLong, General Passenger Agent of the Pennsylvania Railroad; Ivy L. Lee, Executive Assistant of the Pennsylvania Railroad; Augustus V. Hamburg, President, Board of Trade, City of Newark; H. B. R. Potter, Commercial Agent, Erie Railroad; Jackson E. Reynolds, General Attorney for the Central Railroad of New Jersey; Nat Duke, Assistant Traffic Manager of the Delaware, Lackawanna & Western Railroad; John T. Rogers, Traffic Manager, Thos. A. Edison, Inc.; Irving C. Brown, of L. Bamberger & Company and Charles Milbauer, General Agent of the Transcontinental Freight Company.

Annual Banquet of Fort Worth Traffic Club.

THE first annual banquet of the Traffic Club of Fort Worth was held in the Westbrook Hotel on the evening of February 5th. The members and their guests were interestingly entertained by the Hon. W. D. Williams, of the Railroad Commission of Texas who spoke at length on the rate situation in that State. Mr. Clarence Owsley also addressed the banqueters on European travel.

While the Traffic Club of Fort Worth has not yet been in existence two months, more than one hundred and seventy members and guests were in attendance at its annual dinner. The purpose of the organization is to promote a better acquaintanceship between all interested in matters pertaining to traffic. The following officers elected for the first year are:

President—J. M. Andrews, of Armour & Co.

Vice-presidents—R. E. Lay, H. & T. C. R. R. J. C. Griffith, W. C. Stripling Dry Goods Co.; J. M. C. Usher, Washer Bros.; R. L. Carnrike, Mallory Line; E. C. Price, Nash Hardware Company.

Secretary—R. R. Wilson, Fort Worth Warehouse & Tfr. Co.

Treasurer—A. L. Sarrels, T. & P. and I. & G. N. Railways.

Board of Governors—Wm. Roundtree, Burton Dry Goods Co.; A. C. Farmer, Postal Telegraph Co.; W. B. King, Jr., Turner & Dingee; J. D. Gowan, F. W. & D. C. Ry.; R. O. McCormack, Secy., Chamber of Commerce; G. E. Littlefair, St. L. & S. F. R. R.; T. H. Pointer, H. & T. C. R. R.

January Meeting of Central Railway Club.—The January meeting of the Central Railway Club was addressed by Mr. Walter V. Turner, chief engineer of the Westinghouse Air Brake Company, who spoke on Air Brakes and why their possible utility and performance is not obtained in a high degree in actual service. He pointed out that the basic requirements of an automatic brake were reliability, flexibility and effectiveness. He went into detail regarding these three factors, paying particular attention to the influences effecting brake performance. He asserted that in the past, in designing cars, it has been the custom to pay little or no attention to the brake installation until the car and truck has been designed and then the brake installation had to be made the best and some times the worst way it could. He asserted that while it might appear to be asking too much to expect that the car be built around the brake installation, this should be done if proper economy, efficiency and safety are to be assured, that is to say, the proper brake design and installation must include certain well defined provisions, and if these are not possible to incorporate after the trucks and cars have been designed, the brake efficiency will suffer accordingly and a prolific source of trouble may have been embodied in the design as a whole. Mr. Turner asserted that in the last two or three years there had been a marked change in this respect and that now in some few cases, the brake is being considered as a part of the car, that is, as a part of the whole design with consequent limitations in parts of the design which would interfere with the incorporation of an efficient brake design.

January Meeting of the New York Railroad Club.—The New York Railroad Club held its regular January meeting on the 16th ult., on which occasion it was addressed by J. W. Harkon, member of the Canadian Society of Civil Engineers of Richmond, Que., on the question of which is the best in locomotive boilers, rigidity or flexibility. Mr. Harkon was of the opinion that rigidity was very wrong throughout the whole boiler and also that the only way to fully meet fire box trouble was to follow the marine practice and thus compensate for the forward movement of the box. For tube troubles, he suggested that flexible tube sheets should be provided which will equally compensate the expansion of the tubes and he asserted that when this was provided for, tube troubles other than those due to neglect and operation would disappear. In conclusion he stated:

"There is no better way of overcoming trouble arising from natural action than the using of other natural action to neutralize it. In nature every evil or poison has its antidote, and to provide means for flexible action without loss of strength, instead of attempting to resist expansion of metals is, in the writer's view of the matter, the only common-sense course, and the only way to find the antidote.

"Trusting that the importance of some efficient means of meeting the difficulties of locomotive operation will excuse the foregoing expression of views, the whole is respectfully submitted."

February Meeting of Western Railway Club.—The February meeting of the Western Railway Club was held in Chicago on Tuesday evening, February 17th. A paper was presented by A. J. Baker, engineer for the Marshall and Hushchart Machinery Company entitled: "Important Milling Machine Methods in Connection with Railroad and General Shop Work."

Annual Dinner of the Traffic Club of Philadelphia.—The Sixth Annual Dinner of the Traffic Club of Philadelphia was held at the Bellevue-Stratford Hotel, Tuesday, January 13, 1914. Upwards of 400 members of the club and guests were present.

Following the dinner addresses were made by Hon. E. E. Clark, Chairman, Interstate Commerce Commission; E. V. P. Ritter, President, Merchants' & Manufacturers' Exchange, New York; E. C. Sattley, President of the Pittsburgh Traffic Club. Ex-Postmaster General John Wanamaker was to have been present but was taken ill, and sent a paper which was read by

Mr. Robert S. Perry, one of the former presidents of the Traffic Club of Philadelphia.

Edward James Cattell, City Statistician of Philadelphia, was toastmaster.

Guests were present from Pittsburgh, Chicago, Birmingham, New York and cities in New England.

Formation of New Association to Improve Freight Service.—The formation of an association to be known as the American Freight Car Efficiency Association is projected by the Utica Chamber of Commerce, which has invited other commercial bodies to join with it in the movement for betterment of the freight service of the country. J. E. Handley, commissioner of the traffic department of the Utica Chamber of Commerce, asserts that $2,193,828 was paid in demurrage charges to ten Eastern roads last year, and that every dollar represents one car held in excess of free time and one full working day. The average daily travel of all loaded cars, he asserts, is twenty-four miles per day of twenty-four hours. At that rate, he points out, it takes a loaded car "forty days and nights to travel from New York to Chicago."

The purpose of the freight car association is to better that state of affairs, and "by giving appropriate publicity to the details of specific excessive delays to carload freight we will require them individually and collectively to remove the causes of delay and render to the shipping public improved transportation service—to increase the average miles per day per loaded car."

Organization of Veterans' Association.—Employes of the B. & O. resident in Pittsburgh and vicinity, who have been in the service for twenty years, or longer, are organizing a veterans' association, which will affiliate with the Veterans' Association of the system. Already more than 400 members have been enrolled at Pittsburgh. Branches have been established already at Baltimore and Philadelphia and steps are being taken to organize others at Brunswick, Md., Grafton, Wheeling, Newark, Chicago Junction and Garrett, Ind.

Bi-Monthly Meeting of the Traffic Club of Pittsburgh.—The Traffic Club of Pittsburgh held its bi-monthly business meeting at the Fort Pitt Hotel, February 9th, a feature of which was a discussion of the four-month clause in the universal bill of lading which was opened by C. S. Belsterling, traffic manager of the American Bridge Company, and was participated in by a number of the members. A buffet supper, served in the Dutch room, preceded the meeting.

Annual Dinner of Engineering Society of Western Pennsylvania.—Alfred H. Smith, president of the New York Central Lines, addressing the Engineering Society of Western Pennsylvania, at its annual dinner at Pittsburgh, expressed the highest confidence in Government Commissions for railroad regulation. He said in part:

"It appears most probable and proper that the Government, through its Commissions, shall pass upon the outlays made by these properties if private capital is to be called upon.

"In establishing the Commissions the people have provided a means of searching out the facts and truth of the matter in order that they, the people, may do justice and right. The railroads have hope and confidence in these bodies in this work.

"As a general proposition the railroads of this country are physically strong. It has been stated they carry high class freight at the rate of one ton three miles for the value of a two-cent postage stamp; that they carry one ton of dead freight four miles for one cent. Not all of them are making money at these rates. Some of them are getting thin and emaciated."

Annual Dinner of Pittsburgh Passenger Club. Club, given at the Fort Pitt Hotel in February, was not only a notable success, but a noteworthy event in local railroad annals in that, for the first time upon any similar occasion women were included among the guests. The handsome English room, where the dinner was served, was beautifully decorated for the occasion with flags, flowers and potted plants, while the table appointments were of unusual elegance and the dinner itself an elaborate affair. The gustatory portion of the program ended, President W. Scott Miller, who had welcomed the guests, introduced Wyn Burgoyne Morris, assistant general passenger agent of the Pittsburgh & Lake Erie, as toastmaster, under whose direction the flow of oratory was started and continued uninterruptedly till all three of the gentlemen who had been invited to address the diners—His honor, the Mayor of the City; Assistant General Superintendent, C. L. French, of the B. & O. and John W. Boileau—had spoken, after which a social hour was had. A feature of the evening was the singing by a chorus under the direction of C. A. Tushingham, city ticket agent of the Pennsylvania, in which the entire company of 200 or more, joined and which was both excellent and inspiring.

LEGISLATION.

New Jersey State Legislature Petitioned to Repeal Full Crew Law.—The presidents of the principal New Jersey railroads have petitioned the State Legislature to repeal the so-called "full crew" law and assert that they are facing a crisis in their financial careers such as has not been experienced in this part of the country in the last twenty years.

The petition states that "the prosperity of the Railroad Companies and their ability to meet proper demands upon them is, and justly should be, a matter of public concern," and then calls attention to the fact that the Full Crew Law passed in New Jersey last year has already caused a wasteful expense equal to the annual interest on at least $7,394,607 of capital.

The actual expense to their companies of the New Jersey law has to date been $295,784, a figure which would be largely increased if figures were available for all the companies affected.

Not only has this expense been incurred, but there has been no tangible benefit. Safety has not been promoted, and, as the petition says, "the expenditure has been wasted."

The petition for the Full Crew Law's repeal is signed by the following railroad presidents: Mr. Samuel Rea, of the Pennsylvania and West

Jersey and Seashore Railroads; Mr. W. H. Truesdale, of the D., L. & W.; Mr. F. D. Underwood, of the Erie; Mr. E. B. Thomas, of the Lehigh Valley; Mr. George F. Baer, of the Reading and the Central Railroad of New Jersey; Mr. A. H. Smith, of the New York Central, and Mr. J. B. Kerr, of the New York, Ontario and Western.

The railroad executives point out that their companies pay to the State annually $7,513,413.12 in taxes—"more than one-half the sum expended for public schools" in New Jersey. They also pay annually in wages to citizens of New Jersey approximately $47,671,481.

The railroad executives then point out these reasons why they should be relieved of the further operation of this law:

"They have felt the necessity of taking radical measures to reduce expenses and have been obliged to stop all but the most urgent improvements.

"Their application to the Interstate Commerce Commission for a five per cent advance in freight rates, action upon which has been recently further postponed, is a matter of common knowledge and has been under consideration by that body since May 14, 1913.

"They are required to spend large sums each year to provide safety appliances for the protection of employes against accidents.

"Large expenditures for steel passenger equipment will have to be made during the next few years.

"They are confronted with constantly recurring demands for increase in wages.

"The public is demanding the abolition of grade crossings.

"The withdrawal of large amounts from these purposes by the wasteful operation of this statute is an injury to the public.

"These and other causes have brought about a very large increase in operating expenses and created a situation calling for the most rigid economy. Notwithstanding which, these companies are compelled by this statute to expend, without any possible benefit or return, each year many thousands of dollars.

"The claim made that the Act would promote the safety of travelers or employes has been shown to be utterly unfounded; nor has the law proved beneficial in any respect. The expenditure which it has made necessary has been merely wasted.

"The Public Utility Commission before the passage of this law had full power to require the employment of additional trainmen in any instance where it was necessary. A repeal of this law will restore to them this power."

Bill Aimed to Remove Offices of Interstate Commerce Commission to Chicago.— Senator Kenyon, of Iowa, has introduced a bill in the United States Senate authorizing the removal of the headquarters of the Interstate Commerce Commission to Chicago. The bill also proposes to increase the membership of the Commission to sixteen and to divide the country into five sections, over each of which three commissioners shall have jurisdiction. It is further provided that no more than three commissioners shall be appointed from any one section or more than eight from any one political party. The terms of office are made eight years, and no commissioner shall serve in his home district or more than four years in any district. It is provided that the railroads shall have a right of appeal from any locality by the section board to the whole Commission. Besides designating the central office at Chicago, the bill also provides for division headquarters at Washington, Atlanta, Chicago, Kansas City and San Francisco.

To Investigate Rock Island's Financial History.—Representative Green, of Iowa, has introduced a resolution in Congress asking for a complete investigation of Rock Island finances, particularly with regard to the holding companies of this system. The resolution asks for a disclosure of all profits made by Mr. Reid and his associates in the financing of the Rock Island. The resolution has been referred to the House Committee on interstate and foreign commerce.

STATE COMMISSIONS.

California.—The Railroad Commission has issued a supplemental order authorizing the Southern Pacific Company to pay to the bankers and underwriters' syndicate a sum not to exceed $25,000, to cover the expenses in connection with the flotation of the $55,000,000 bond issue authorized by the Commission the ninth instant. The order also authorizes the payment of the five per cent one year notes of the Company due June 15, 1914, in the sum of $26,000,000; also a loan due May 29, 1914, in the sum of $4,500,000, and also the payment of $3,000,000 due for equipment already purchased.

Illinois.—The Public Utilities Commission has authorized the issue of $21,184,000 securities to be for the Chicago Northwestern Railway. It includes $10,000,000 equipment trust certificates and $11,184,000 in general mortgage gold bonds.

The Public Utilities Commission has suspended, until April 23rd, a proposed advance in rates on grain and grain products throughout the State ranging between ½ and 1 per cent per 100 pounds. The increase was suspended a short time ago until February 23rd, and the additional suspension was ordered in order to give the Commission an opportunity to give further consideration to a protest by shippers against the advance.

Kentucky.—The thirty-fourth annual report of the Railroad Commission of Kentucky, submitted to the Governor, shows assessments of tangible property of railroad companies in the State last year aggregating $70,241,609, as compared with $68,241,609 in 1912, and $54,181,031 in 1904, when the Commission began making such assessments. Operating trackage in Kentucky in 1913 was 3,973 miles. Accidents show considerable decreases, as compared with the preceding year.

The Commission reports that many complaints were adjusted last year without formal hearing. Reports of contested cases, together with opinions and orders, are contained in the annual publication.

Attention is called to the fact that many provisions in the Kentucky statutes are ineffectual in that certain duties are imposed upon carriers by law no adequate remedy is provided to make carriers comply. The passage of a comprehensive act is recommended, giving to the Railroad Commission supervisory authority over the rules, regulations and practices not only railroad companies, but over express companies, steamboat lines, electric railways and sleeping car companies.

Louisiana.—The Railroad Commission has issued an order directing the Yazoo & Mississippi Valley Railroad Company to equip with modern, approved block signals, during the year 1914, the entire line from Kenner Junction to North Baton Rouge. This order is an amendment to the order previously issued affecting the Illinois Central, Yazoo & Mississippi Valley, and Texas & Pacific roads, directing these roads to equip their lines with modern block signals at the rate of twenty miles a year.

Minnesota.— The Railroad and Warehouse Commission has ruled that the Northern Pacific and Great Northern Railroads must pay refunds to shippers of mixed carloads of stock within the State for excess charges in the six years of rate legislation which was terminated by the decision of the United States Supreme Court in the Minnesota rate case.

The application of the Duluth & Northern Minnesota for an injunction restraining the Minnesota Railroad Commission from enforcing the maximum commodity rate, under the Cashman distance tariff law, has been denied.

Missouri.—On February 4th, a big delegation of Kansas City produce men appeared before the Public Service Commission, to protest against a "storage charge" which railroads entering Kansas City make for the holding of a car longer than the free period of forty-eight hours. This charge is levied, in addition to the $1 a day demurrage charge. It is cumulative in its character, starting in at $2 and gradually increasing so long as the car is held on the "team tracks" without being unloaded.

The contention of the railroads is that the produce dealers at Kansas City and other places are using the cars for warehouse purposes. "They have the cars set out on the team tracks and there hold them until the market is right, and the commodity sold, after which they are reconsigned to destination," said Thomas R. Morrow, representing the Santa Fe. "It is cheaper for the produce men to keep the cars and pay $1 a day demurrage than to incur the expense of unloading and warehousing the commodity. To break up this practice the roads began the imposition of a storage charge which is levied as a rental for the car and as a penalty for holding it. This charge, which is cumulative, is intended to compel the unloading of cars and their removal from team tracks so that other dealers can get their stuff onto team tracks for inspection, sale and unloading."

The Commission, after hearing both sides, took the matter under advisement.

Montana.—The State Railroad Commission has denied the application of the Pullman Company, and the Northern Pacific, Chicago, Milwaukee & St. Paul, Great Northern and Oregon Short Line railroads to increase the sleeping car service average rate 75 per cent in cases where one person occupies either a section or a stateroom.

New York.—A very interesting point is involved in a decision handed down by the up-State Public Service Commission against the Delaware, Lackawanna & Western Railroad. The case grew out of complaints made by the Common Council of the city of Oswego and residents of South Granby, Lamson, and Little Utica against the Lackawanna for discontinuing four passenger trains running between Oswego and Syracuse and serving various intermediate points.

In answering the complaint Lackawanna claimed that the trains had proved unprofitable. The company was ordered to restore the service, however, on the ground that "It is not the law, and never was, that a railroad might refuse to perform all service which could not be performed at a profit."

Pennsylvania.—On February 5th, the Public Service Commission ruled that railroad companies in Pennsylvania may issue free passes to their officers and employes to be used for the transportation of the dependent members of the families of such officers and employes. The ruling is strengthened by a declaration that the granting of these concessions will not be regarded by the Commission as a violation of the provisions of the Public Service Company law, which went into effect January 1st.

It also ruled that the free transportation furnished by common carriers to policemen and firemen in the discharge of their public duties is not such free transportation as is prohibited by the provisions of the law.

A general order has been issued by the Public Service Commission on grade crossings providing that before an electric railway car crosses the tracks of a steam railroad, the conductor shall go in advance and ascertain whether there are any approaching trains. He shall not signal the motorman to proceed until he is assured that there is no danger. At crossings where conditions are especially dangerous, safety devices must be provided which must be submitted to and approved by the investigator of accidents for the Commission.

One of the regulations provides that a light shall be displayed on the dead end of railroad trains when it is necessary to shift cars by night over a public crossing, notwithstanding the fact that the crossing constitutes part of the yards.

President F. D. Underwood, of the Erie Railroad Company, has suggested to the Railroad Commission the danger of high power transmission lines, and suggested that special consideration be given to the method of construction, which should be adopted for all such lines where they cross the tracks of railroads overhead, and likewise of the minimum distance that they should be placed from the tracks of railroads when paralleling them.

Texas.—The petition of the railroads of the State for a hearing to consider the advisability of giving them a horizontal advance of fifteen per cent on all freight rates in effect in Texas has been refused by the Railroad Commission, the petition being dismissed without merit.

The Railroad Commission has issued its annual report for the year ending June 30th, 1913, compiled from the reports of 102 railroad corporations. The report shows that there were on

June 30, 1913, 15,823 miles of main line and branches, a net increase over 1912 of 342½ miles; yard track and sidings, 3,970 miles, increase of 212 miles, and a net increase of all classes of track of 554 miles. Of this mileage, 22.50 is narrow gauge.

The total capital stock and bonds of these 102 railroads is $483,298,424, of which $128,540,728 is stock and $334,757,696 is bonds. The general averages per mile of road are $8,409 capital stock and $23,206 bonds. Indebtedness other than stock and bonds, $6,459 per mile, making the total liabilities $38,074 per mile. This is an increase of $3,232 per mile.

The total passenger earnings of these railroads in Texas was $24,366,817; increase $3,528,697 for the year. The total gross freight earnings were $116,460,375, an increase of $10,107,074. The total increase in gross earnings was $13,678,844.

The operating expenses totaled $90,991,943, which is an increase of $9,273,821, or 11.35 per cent increase in income from operation is $4,405,022, the total operating expenses being $90,991,943. The net operating revenue is given at $23,171,847; the gross corporate income is $28,743,021, showing a decrease of $1,601,378.

The total assessed valuation of Texas railroads, including rolling stock and intangible assets for 1913 is given at $344,635,318 as against $334,573,512 for 1912. The total number of tons of commercial freight carried was 57,241,529, against 49,693,884 for 1912.

LEGAL.

Man Slaughter Indictments Against New Haven Officials Cancelled.—The man slaughter indictments resulting from the wreck at Westport, Conn., against five officials of the New Haven System, have been quashed by the State's Attorney at Bridgeport, Conn., but that official has refused to annul the indictment against former President Charles S. Mellen.

The Southern Pacific-Central Pacific Suit.—The Attorney General has filed suit at Salt Lake City to separate the Central Pacific from the Southern Pacific. Pacific coast shippers and travelers, through their representative commercial bodies, have flooded Washington with protests. For the question is serious. The suggested separation would mean hardship to the public and injustice to the company.

It is alleged that the two roads are competitive and are in restraint of trade. The history of their construction and operation will effectually refute this. In 1889 the Central Pacific was completed. The same stockholders in 1891 began their extensions southward. It happened that the Central Pacific was under heavy obligations for advances by the Government and investors refused to buy bonds for new work if they were to be subject to debts on the old. So that, purely as a matter of reassuring investors, and for no other reason, the Southern Pacific Railroad Company was organized and built the rest of the system, leasing the lines as completed to the Central Pacific. In 1885, with the full knowledge of the Government, the Southern Pacific Company was brought into being and took over all the lines in a more simple organization.

Always the roads have been constructed and run by substantially the same set of people. In the purchase of terminals and the extension of branches, but one point has been kept in mind, to give the coast an elastic and comprehensive transportation service regardless of whether it were Central or Southern Pacific, responsive to needs. The case is not the same as if the two roads had been built by different people, competing with each other and had been bought, one by the other, to put that competition out of the way. They were, from the beginning to the present time, parts of one amalgamated whole.

To separate the Central Pacific from the Southern Pacific would mean the duplication of organizations, rights of way, terminals, facilities and equipment. This would be expensive. Joint rates between the Central Pacific and the Southern Pacific or other companies would, on the general principles laid down by railroad commissions, be higher when the carriage is over two railroads than when handled by one entity, for all of which the public would have to pay. The public would get no better service. On the whole, the service would be inferior, because one company can give better service than two for the carriage of the same shipment or traveler. The tendency of rates would be upward, not downward, and the impediments to business and points of friction would be increased.

The Southern Pacific would be less effective than now. The Central Pacific would not serve the public as well as at present. The Southern Pacific would be left without a line from San Francisco to Stockton, its through connection to Portland and the North would be broken, and its branches to Ione, Lodi, Valley Springs; from Stockton to Mercer and Hilton; and from Berenda to Raymond would be marooned high and dry, dependent on another line to get its shipments from interior points to its main system. The difficulties this would occasion to passengers and shippers can be only imagined.

Certain through trains or routes that have been developed and used would be discontinued or broken up. Freight and passenger trains are now sent over the most direct lines, giving most expeditious service, and they would have to be forced over roundabout and indirect lines by either company under separation. All this would be a hardship to the traveler or shipper, a loss in time, and a loss in convenience.

Similar difficulties would present themselves with a separation of terminal facilities. Patrons on either Central Pacific or Southern Pacific now enjoy without further cost or inconvenience all the facilities of both roads.

CONSTRUCTION.

Correcting the Damage Caused by Western Floods.—The Baltimore and Ohio Southwestern and the Cincinnati, Hamilton and Dayton Lines have rebuilt or repaired all of the steel bridges destroyed or damaged by the floods of last spring. These include bridges at Hamilton, Ohio, Lawrenceburg, Ind., Zanesville, Ohio, Marietta, Ohio, Washington, Ind., Brownsville, Ind. and Morristown, Ind.

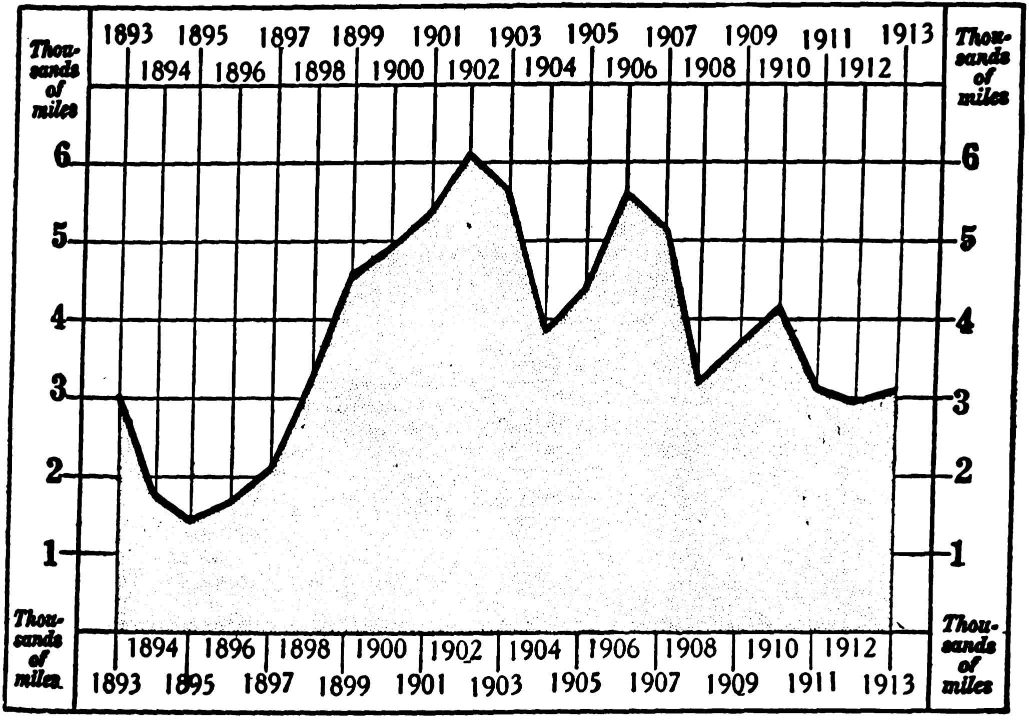
CONSTRUCTION.

The Growth in Railway Mileage.

THE following diagram appearing in the New York "Times Annalist," of February 23rd, indicates in a striking manner the growth of railway mileage in the United States from 1893 until 1913. As the chart indicates, from 1895 until 1902, there was a steady increase in the number of miles added to the country's system during each year. Since then, however, while there have been years which developed more favorable results than others, the movement has been steadily downward until 1913, the number of new miles constructed was only about half of the number built in 1902. In view of the comparative newness of the country and the millions of acres of productive land which is still inadequately supplied with transportation facilities, these figures form one of the many striking reasons which have recently been advanced for a more liberal railway policy. It is undoubtedly true that under what might be termed normal or favorable conditions, new railway contsruction could progress in this country for a number of years to come at the rate of at least twice that of 1913, both to the profit of railway investors and the public at large.

EQUIPMENT.

New Locomotives for the Missouri Pacific System.— The Missouri Pacific-Iron Mountain has placed an order with the Baldwin Locomotive Works, of Philadelphia, for twenty-five huge locomotives. They will be of the Mikado type and will be used in freight service. In every detail these engines will represent the latest effort in locomotive construction. The light weight of the engine and tender will be 311,900 pounds, and when in working condition and ready for service the total weight will run close to 400,000 pounds. The weight on the drivers will be 209,000 pounds and the locomotives will have a tractive force of 50,160 pounds. The specifications call for cylinders 27 inches by 30 inches, and the boiler pressure requirement is 170 pounds to the square inch. The total length of the engines will be 78 feet 4½ inches, and they will measure 15 feet 5½ inches from the rail to the top of the smoke stack. They will be equipped with Schmidt superheaters, a recent invention for increasing the power of steam, and will also have electric headlights and electric cab lights.



The Growth of Railroad Mileage

ELECTIONS AND APPOINTMENTS.

Executive.

W. G. Bierd, director and president, Chicago & Alton R. R. Headquarters, Chicago, Ill.

Charles S. Churchill, assistant to the president, in charge of federal valuation, Norfolk and Western. Headquarters, Roanoke, Va.

D. W. Cooke, vice-president, Erie Railroad. Headquarters, New York City.

Howard Elliott, vice-president, Rutland Railroad.

William Fleming, assistant to first vice-president, Pennsylvania Lines West of Pittsburgh.

Clarence W. Huntington, vice-president and general manager, Minneapolis and St. Louis Railroad. Headquarters, Minneapolis, Minn.

Robert L. Ingersoll, assistant to president, New York Central Lines. Headquarters, New York.

George T. Jarvis, vice-president and general manager, Rutland Railroad. Headquarters, Rutland, Vt.

F. H. Knickerbocker, assistant to vice-president and general manager, Oregon Shore Line Railroad. Headquarters, Salt Lake City, Utah.

M. P. Knowlton, chairman of the Board of Trustees, New Haven Railroad.

Oliver C. Lisman, first vice-president and general manager, Kansas City and Memphis Railway. Headquarters, Elkins, N. C.

Morris McDonald, president, Maine Central. Headquarters, Portland, Me.

J. F. Manning, president and general manager, Crystal River and San Juan Railway. Headquarters, Marble, Colo.

George F. Moore, president and general manager, St. Louis and O'Fallon Railway. Headquarters, South Side Bank Bldg., St. Louis, Mo.

A. B. Newell, president, Toledo Terminal R. R. Headquarters, Detroit, Mich.

Warren S. Palmer, president, Northwestern Pacific. Headquarters, San Francisco, Cal.

Edwin Pearson, assistant to the president and assistant secretary of the Spokane, Portland and Seattle Railway. Headquarters, Portland, Oregon.

A. E. Potter, president and general manager, Narragansett Pier Railroad. Headquarters, Providence, R. I.

P. M. Ripley, assistant to vice-president, El Paso and Southwestern System. Headquarters, New York City.

A. M. Schoyer, first vice-president, Pennsylvania Lines West of Pittsburgh.

S. C. Scott, vice-presidents' assistant. Pennsylvania Lines. Headquarters, Pittsburgh, Pa.

William R. Scott, vice-president and general manager, Southern Pacific. Headquarters, San Francisco, Cal.

Alfred H. Smith, president, Rutland Railroad.

J. J. Turner, first vice-president, Pennsylvania Lines West of Pittsburgh.

Frank B. Whipple, vice-president, San Francisco-Oakland Terminal Railways. Headquarters, Oakland, Cal.

J. L. White, assistant to the president, Chicago, Indianapolis and Louisville. Headquarters, Chicago, Ill.

Charles N. Whitehead, vice-president, Missouri, Kansas and Texas Railway. Headquarters, St. Louis, Mo.

Bluford Wilson, president, Chicago, Peoria & St. Louis R. R.

Legal.

Richard W. Barrett, assistant general solicitor, Lehigh Valley R. R. Headquarters, New York.

Orville F. Berry, of Illinois, examiner-attorney for the Interstate Commerce Commission.

A. L. Geylin, freight solicitor, Pennsylvania Railroad. Headquarters, Harrisburg, Pa.

W. T. Henry, general attorney, Missouri Pacific and St. Louis, Iron Mountain and Southern in Texas.

Edward W. Hines, examiner-attorney, Interstate Commerce Commission.

Sam A. Leake, general attorney, Missouri Pacific and the St. Louis, Iron Mountain and Southern in Texas.

Arthur B. Pugh, examiner-attorney, Interstate Commerce Commission.

E. H. Wigand, soliciting agent, Louisville and Nashville Railroad. Headquarters, Memphis, Tenn.

Financial.

I. W. Booth, assistant secretary, Norfolk and Western Railway. Headquarters, Philadelphia, Pa.

Kirke Lathrop, treasurer, San Francisco-Oakland Terminal Railways. Headquarters, Oakland, Cal.

Robert Morrison, Jr., secretary, San Francisco-Oakland Terminal Railways. Headquarters, Oakland, Cal.

Frederick S. Wynn, secretary, Southern Railway. Headquarters, New York.

Accounting.

C. C. Barry, auditor, San Pedro, Los Angeles & Salt Lake Railway. Headquarters, Los Angeles, Cal.

O. H. Bower, auditor, Missouri, Kansas and Texas Railway. Headquarters, Dallas, Texas.

R. J. Dillon, auditor, Houston and Brazos Valley Railroad. Headquarters, Freeport, Texas.

F. J. Easton, auditor, Rutland Railroad.

H. M. Hood, comptroller, New Orleans, Mobile and Chicago Railroad. Headquarters, Mobile, Ala.

G. C. Jackson, auditor of claims, Canadian Pacific Railway. Headquarters, Montreal, Que.

C. W. Keeling, auditor, Danville and Western Railway. Headquarters, Danville, Va.

L. L. Knight, auditor, Macon, Dublin & Savannah. Headquarters, Macon, Ga.

James T. Leary, comptroller, Baltimore and Ohio Railroad. Headquarters, Baltimore, Md.

F. L. McCaffery, auditor of disbursements, Southern Pacific. Headquarters, San Francisco, Cal.

G. W. Mulks, assistant controller, Southern Pacific Co. Headquarters, New York.

P. L. Overman, freight auditor, Western Maryland. Headquarters, Baltimore, Md.

F. W. Pope, auditor of freight accounts, Southern Pacific Company. Headquarters, San Francisco, Cal.

Edgar A. Richard, acting auditor, Pacific and Idaho Northern Railway and the Central Idaho Telegraph and Telephone Company. Headquarters, Meadows, Idaho.

J. O. Talbot, auditor of receipts, Missouri, Kansas and Texas Railway. Headquarters, Dallas, Texas.

Engineering and Mechanical.

Francis H. Adams, senior mechanical engineer, division of valuation, Interstate Commerce Commission. Headquarters, Kansas City, Mo.

C. D. Ashmore, master mechanic, Chicago & North Western Railway. Headquarters, Clinton, Iowa.

William G. Atwood, assistant district engineer, Division of Valuation, Interstate Commerce Commission. Headquarters, Chattanooga, Tenn.

J. C. Auten, principal assistant engineer, Philadelphia, Baltimore and Washington. Headquarters, Wilmington, Del.

G. R. Barry, division engineer, Pennsylvania

Lines West of Pittsburgh. Headquarters, Columbus, Ohio.

C. A. Bingaman, assistant engineer motive power, Philadelphia & Reading Railway. Headquarters, Reading, Pa.

R. L. Black, general foreman, Norfolk and Western Railway. Headquarters, Columbus, Ohio.

George H. Bremner, assistant district engineer of the board ot valuation engineers, Interstate Commerce Commission.

William E. Brown, supervisor of division No. 20, Pennsylvania Railroad. Headquarters, Hollidaysburg, Pa.

W. S. Butler, master mechanic, Huntington and Big Sandy divisions, Chesapeake and Ohio and the Chesapeake and Ohio of Indiana. Headquarters, Huntington, W. Va.

F. I. Cabell, chief engineer, Chesapeake and Ohio and the Chesapeake and Ohio of Indiana. Headquarters, Richmond, Va.

C. J. Chenworth, engineer of roadway, Atlantic Coast Line. Headquarters, Savannah, Ga.

D. C. Clough, master mechanic, Oregon Electric and the United Railways. Headquarters, Portland, Oregon.

J. K. Conner, chief engineer, Lake Erie and Western and the Northern Ohio. Headquarters, Indianapolis, Ind.

J. E. Crawford, chief engineer, Norfolk and Western and the Williamson & Pond Creek. Headquarters, Roanoke, Va.

B. F. Crowley, supervisor of locomotive operation, Baltimore and Ohio. Headquarters, Wheeling, W. Va.

B. J. Dalton, assistant district engineer, Western district, Division of Valuation, Interstate Commerce Commission. Headquarters, Kansas City, Mo.

John Dickson, master mechanic, Spokane, Portland and Seattle Railway, Oregon Trunk Railway, Oregon Electric Railway and the United Railways. Headquarters, Portland, Oregon.

J. G. Dole, master mechanic, Alliance division, Chicago, Burlington and Quincy Railroad. Headquarters, Alliance, Neb.

R. M. Drake, maintenance of way assistant, Southern Pacific Company. Headquarters, San Francisco, Cal.

J. Dwyer, roadmaster, Portland division, Spokane, Portland and Seattle Railroad. Headquarters, Portland, Oregon.

C. C. Elmes, assistant engineer motive power, Reading Companies. Headquarters, Reading, Pa.

B. Ferris, acting general foreman, Detroit, Toledo and Ironton Railway. Headquarters, Delray, Mich.

Lewis D. Freeman, mechanical inspector, Seaboard Air Line. Headquarters, Portsmouth, Va.

J. A. Griffin, engineer of maintenance of way and structures, Georgia, Southern and Florida. Headquarters, Macon, Ga.

W. E. Grove, inspector car department, Philadelphia and Reading Railway. Headquarters, Reading, Pa.

E. B. Hall, assistant to the general superintendent of motive power and car departments, Chicago and North Western. Headquarters, Chicago, Ill.

O. G. Hartmann, mechanical foreman, Wisconsin & Michigan Railway. Headquarters, Peshtigo, Wis.

T. W. Heinzelman, general superintendent of motive power, Southern Pacific Company. Headquarters, San Francisco, Cal.

T. E. Hessenbruch, assistant general car inspector, Philadelphia and Reading Railway. Headquarters, Reading, Pa.

James E. Howard, engineer-physicist, safety appliance division, Interstate Commerce Commission.

C. W. Jones, engineer of branch lines, Chesapeake and Ohio Railway. Headquarters, Richmond, Va.

John Karibo, division master mechanic, Cleveland, Cincinnati, Chicago & St. Louis Ry. Headquarters, Mattoon, Ill.

R. F. Laift, head of architectural department, Central district, division of valuation, Interstate Commerce Commission. Headquarters, Chicago, Ill.

T. F. Laist, chief of the architectural department, Holabird and Roche Railway. Headquarters, Chicago, Ill.

William Lanon, supervisor of locomotive operation, Arkansas, Indian Territory and Louisiana divisions, Rock Island Lines.

A. D. Millard, engineer, Chicago, Peoria and St. Louis. Headquarters, Jacksonville, Ill.

C. W. Montgomery, supervisor of division No. 5, Pennsylvania Railroad Company. Headquarters, Harrisburg, Pa.

D. J. Mullen, assistant to the superintendent of motive power, Cleveland, Cincinnati, Chicago and St. Louis. Headquarters, Indianapolis, Ind.

T. Nicholson, master mechanic, Louisiana Railway & Navigation Company. Headquarters, Shreveport, La.

George G. Ommanney, special engineer, to the president, Canadian Pacific. Headquarters, Winnipeg, Man.

H. Osborne, assistant mechanical superintendent, Canadian Pacific Railroad. Headquarters, Montreal, Que.

Alonzo G. Pack, assistant chief inspector of locomotive boilers, Interstate Commerce Commission.

E. I. Partlow, road foreman of engines, Indianapolis division, Baltimore and Ohio, Cincinnati, Hamilton and Dayton Lines. Headquarters Indianapolis, Ind.

F. M. Patterson, engineer of the Missouri district, Chicago, Burlington & Quincy R. R. Headquarters, St. Louis, Mo.

S. T. Patterson, supervisor of locomotive operation, Chicago terminal and Illinois divisions, Chicago, Rock Island and Pacific Railroad.

F. R. Pennyfather, master mechanic, Manitoba division, Canadian Pacific. Headquarters, Winnipeg, Man.

A. P. Prendergast, superintendent of machinery, Texas and Pacific Railway.

R. B. Rasbridge, superintendent car department, Philadelphia and Reading Railroad. Headquarters, Reading, Pa.

Raymond V. Reamer, engineer maintenance of way, Central division, Central of New Jersey Railroad. Headquarters, Jersey City, N. J.

J. C. Resch, assistant chief engineer, International and Great Northern. Headquarters, Houston, Texas.

D. Rounseville, engineer of maintenance, Chicago and North Western Railway.

Frederick F. Schaller, signal engineer of safety appliance division of the Interstate Commerce Commission.

Frank S. Sheetz, senior structural engineer in charge of bridge and building department, division of valuation, Interstate Commerce Commission. Headquarters, Kansas City, Mo.

Clifton B. Spencer, senior civil engineer, division of valuation, Interstate Commerce Commission. Headquarters, Kansas City, Mo.

E. Sullivan, roadmaster, Chicago, Rock Island and Pacific Railway. Headquarters, Washington, Iowa.

Herbert L. Thomas, division engineer, Pennsylvania Railroad. Headquarters, Elmira.

H. B. Titcomb, maintenance of way assistant, Southern Pacific Company. Headquarters, San Francisco, Cal.

George P. Turner, assistant engineer, assigned to valuation work, Union Pacific R. R. Headquarters, Omaha, Neb.

O. Walsh, superintendent of motive power, Georgia Railroad. Headquarters, Augusta, Ga.

A. C. Watson, division engineer, Pennsylvania Lines. Headquarters, Logansport, Ind.

F. H. Watts, division engineer, Pittsburgh division, Pennsylvania Lines West of Pittsburgh. Headquarters, Pittsburgh.

Frank S. Wheeler, division engineer, Erie R. R. Headquarters, Buffalo, N. Y.

Frederick Grant White, signal engineer, Chicago Great Western Railroad. Headquarters, Chicago, Ill.

H. C. Williams, chief engineer of contsruction, Louisville and Nashville Railroad. Headquarters, Louisville, Ky.

R. W. Willis, district engineer, Chicago, Burlington and Quincy R. R.

D. C. Wilson, electrical engineer, Union Pacific R. R. Headquarters, Omaha, Neb.

R. D. Wilson, general car inspector, Philadelphia and Reading Railway. Headquarters, Reading, Pa.

W. E. Woodhouse, superintendent of motive power, Eastern Lines, Canadian Pacific. Headquarters, Winnipeg, Man.

T. W. Younger, superintendent of motive power, Northern district, Southern Pacific Company. Headquarters, Sacramento, Cal.

Operation.

C. W. Akers, superintendent, Western division, Norfolk, Southern Railroad. Headquarters, Raleigh, N. C.

W. H. Andrews, general manager, Georgetown and Western Railroad. Headquarters, Georgetown, S. C.

Frank D. Austin, manager, Mt. Jewett Route, Baltimore and Ohio and Erie Railroads. Headquarters, New York.

F. R. Bartles, superintendent, Fargo division, Northern Pacific Railway.

J. M. Baths, division superintendent, Chicago, Indianapolis and Louisville Railroad. Headquarters, Lafayette, Ind.

J. D. Beaver, superintendent, Pittsburgh, Shawmut and Northern Railroad. Headquarters, St. Mary's, Pa.

W. D. Beck, superintendent of passenger terminals, Chicago and North Western Railway. Headquarters, Chicago, Ill.

H. C. Bixler, acting superintendent, Philadelphia terminal division, Pennsylvania Railroad. Headquarters, West Philadelphia, Pa.

H. A. Boomer, general manager, Lake Erie and Western Railroad. Headquarters, Indianapolis, Ind.

G. A. Bradley, superintendent, Raleigh, Charlotte and Southern Railway. Headquarters, Raleigh, N. C.

J. N. Brand, general superintendent, Third division, Atlantic Coast Line. Headquarters, Jacksonville, Fla.

H. H. Brigham, manager, Nickel Plate-Lackawanna Dairy Line. Headquarters, Chicago, Illinois.

C. H. Bristol, acting general superintendent, Northern district, Atchison, Topeka and Santa Fe Ry. Headquarters, La Junta, Colo.

T. B. Burgess, trainmaster, Chicago division, Baltimore and Ohio Railroad. Headquarters, Garrett, Ind.

James Burke, superintendent, Chicago Terminal division, Erie Railroad. Headquarters, Cleveland, Ohio.

S. E. Burkhead, assistant general manager, International and Great Northern Railway.

C. E. Burr, general superintendent of transportation, Delaware and Hudson Company. Headquarters, Albany, N. Y.

John W. Byng, general manager, Kansas City, Ozark and Southern Railway. Headquarters, Ava, Mo.

D. W. Campbell, assistant general manager, Southern Pacific. Headquarters, Portland, Oregon.

C. E. Carson, superintendent, Ft. Dodge, Des Moines and Southern Railway. Headquarters, Boone, Iowa.

J. R. Cary, general superintendent, Chesapeake and Ohio Ry. Headquarters, Clifton Forge, Va.

J. R. Cavanaugh, superintendent of car service, Cleveland, Cincinnati, Chicago and St. Louis Railway.

J. M. Chandler, superintendent, Red River division, St. Louis and San Francisco Railroad. Headquarters, Francis, Okla.

Charles Chandler, trainmaster, Southern Railway. Headquarters, Birmington, Ala.

D. J. Clarke, trainmaster, Chicago, Indianapolis and Louisville Railroad. Headquarters, Lafayette, Ind.

G. A. Coleman, acting trainmaster, Chicago, Peoria and St. Louis. Headquarters, Springfield, Ill.

T. B. Coppage, superintendent transportation, St. Louis and San Francisco R. R. Headquarters, Fort Scott, Kansas.

William Coughlin, general manager, Missouri, Oklahoma and Gulf Railway. Headquarters, Muskogee, Okla.

M. Crown, superintendent of terminals, Atlantic Coast Line R. R. Headquarters, Jacksonville, Fla.

J. M. Davis, assistant general manager, Baltimore and Ohio Southwestern R. R. and the Cincinnati, Hamilton and Dayton Railway. Headquarters, Cincinnati, Ohio.

W. H. DeFrance, division superintendent, Texas and Pacific. Headquarters, New Orleans, La.

J. H. Doggrell, assistant superintendent transportation, St. Louis and San Francisco R. R. Headquarters, Springfield, Mo.

L. M. Dooley, transportation inspector, Texas and Pacific Railway. Headquarters, New Orleans, La.

W. C. Downing, general superintendent, Central System of the Pennsylvania Lines West of Pittsburgh. Headquarters, Toledo, Ohio.

Abiel D. Edgar, assistant superintendent, New Jersey Central division, Central of New Jersey Railroad. Headquarters, Jersey City, N. J.

Edward J. Edmunds, trainmaster, the Erie. Headquarters, Buffalo, N. Y.

W. J. Edwards, superintendent, Alabama Great Southern Railroad. Headquarters, Birmingham, Ala.

A. C. Elston, superintendent, New York division, Erie Railroad. Headquarters, Jersey City, N. J.

J. A. Emmart, superintendent, Georgetown and Western Railroad. Headquarters, Georgetown, S. C.

R. H. England, general manager, Kanawha & West Virginia Railroad. Headquarters, Charleston, W. Va.

Frank J. Evans, superintendent, Pecos division, Atchison, Topeka and Santa Fe Railway. Headquarters, Clovis, N. M.

John K. Fahey, superintendent of terminals, Morgan's Louisiana & Texas R. R. and Steamship Company. Headquarters, New Orleans, Louisiana.

H. G. Farrar, superintendent, Columbus division, Southern Railway. Headquarters, Williamson, Ga.

J. Fitzgerald, assistant trainmaster, Baltimore and Ohio Railroad. Headquarters, Cleveland, Ohio.

Frank Fitzpatrick, assistant trainmaster, International and Great Northern Railway. Headquarters, Valley Junction, Texas.

W. H. Fogg, division superintendent, Chicago, Indianapolis and Louisville Railroad. Headquarters, Lafayette, Ind.

J. F. Frazer, assistant superintendent, River and Cape division, St. Louis and San Francisco R. R. Headquarters, Chaffee, Mo.

R. S. Goodrich, transportation inspector, Atchison, Topeka and Santa Fe Coast Lines. Headquarters, Winslow, Ariz.

B. Haggard, trainmaster, Northern Alabama Railway. Headquarters, Sheffield, Ala.

Thomas B. Hamilton, general manager, the Vandalia Railroad. Headquarters, St. Louis, Mo.

R. R. Harris, superintendent of freight transportation, Cleveland, Cincinnati, Chicago and St. Louis Railway. Headquarters, Indianapolis, Ind.

W. C. Herbert, trainmaster, Southern Railway. Headquarters, Richmond, Va.

C. L. Hinkle, general superintendent, Toledo, St. Louis and Western Railroad.

C. F. Hopkins, superintendent, Southwestern division, St. Louis and San Francisco R. R. Headquarters, Sapulpa, Okla.

John R. Jones, superintendent, San Antonio division, International and Great Northern Railway. Headquarters, San Antonio, Texas.

J. F. Keefe, assistant superintendent, Northern division, Central Vermont Railroad. Headquarters, St. Albans, Vt.

E. E. Kerwin, general superintendent, Minneapolis and St. Louis R. R. Headquarters, Minneapolis, Minn.

E. L. King, superintendent of telegraph, Southern Pacific Company. Headquarters, San Francisco, Cal.

E. G. Knapp, assistant trainmaster, Pennsylvania Lines. Headquarters, Carbondale, Penna.

Charles L. Krick, superintendent, Philadelphia terminal division, Pennsylvania Railroad. Headquarters, West Philadelphia, Pa.

George LeBoutillier, superintendent, Richmond division, Pittsburgh, Cincinnati, Chicago & St. Louis.

C. S. Leiper, superintendent, New York, Philadelphia and Norfolk Railroad. Headquarters, Cape Charles, Va.

Edward D. Levy, general manager, St. Louis and San Francisco Railroad. Headquarters, St. Louis, Mo.

J. C. Lewis, acting superintendent, Central division, Norfolk Southern Railway. Headquarters, New Bern, N. C.

J. T. Loree, trainmaster, Pennsylvania Lines. Headquarters, Oneonta, New York.

T. F. Lowry, superintendent, Minnesota division, Northern Pacific Railway.

O. H. McCarty, superintendent, Northern division, St. Louis and San Francisco Railroad. Headquarters, Fort Scott, Kansas.

R. A. McCranie, general superintendent, Atlantic Coast Line. Headquarters, Savannah, Ga.

J. C. McCullough, superintendent of the Pittsburgh division, Pennsylvania Lines West of Pittsburgh. Headquarters, Pittsburgh, Pa.

J. McGuire, assistant superintendent, Portland division, Spokane, Portland and Seattle. Headquarters, Portland, Ore.

S. E. McKenney, terminal trainmaster, Central Vermont Railroad. Headquarters, St. Albans, Vermont.

A. W. McLimont, general manager, San Francisco-Oakland Terminal Railways. Headquarters, Oakland, Cal.

J. E. McMahon. superintendent, Colorado division, Atchison, Topeka and Santa Fe Railroad. Headquarters, Pueblo, Colo.

P. L. McManus, general superintendent, Chicago, Indianapolis and Louisville Ry. Headquarters, Lafayette, Ind.

M. Magiff, superintendent of car service, Central Vermont Railway. Headquarters, St. Albans, Vt.

H. T. Malcolmson, superintendent of car service, Toronto, Hamilton and Buffalo. Headquarters, Hamilton, Ont.

C. T. Mason, superintendent, Western division, St. Louis and San Francisco Railroad. Headquarters, Enid, Okla.

R. V. Massey, superintendent, Manhattan division, Pennsylvania Railroad. Headquarters, New York.

J. W. Meredith, general superintendent, New Jersey Southern division of the Central of New Jersey. Headquarters, East Long Branch, N. J.

Arthur L. Mills, general manager, Ft. Smith and Western. Headquarters, Ft. Smith, Ark.

C. A. Morgan, superintendent, Carbondale division, Pennsylvania Lines. Headquarters, Carbondale, Pa.

B. C. Mulhern, general superintendent, Pittsburgh, Shawmut and Northern R. R. Headquarters, St. Mary's, Pa.

H. V. Platt, assistant general manager, Southern Pacific. Headquarters, Los Angeles, Cal.

G. E. Reel, trainmaster, Cincinnati, Hamilton and Dayton Railway. Headquarters, Lima, Ohio.

Morton Riddle, general manager, Florida East Coast Railway. Headquarters, St. Augustine, Fla.

H. W. Rives, superintendent, Deering Southwestern. Headquarters, Caruthersville, Mo.

J. J. Rounds, trainmaster, Pennsylvania Lines. Headquarters, Carbondale, Pa.

D. C. Rounseville, engineer of maintenance, Chicago and North Western Lines east of Missouri River. Headquarters, Chicago, Ill.

J. Russell, general superintendent, Western district, Great Northern Railway. Headquarters, Seattle, Wash.

S. S. Russell, superintendent, Northern division, Central Vermont Railway. Headquarters, St. Albans, Vt.

E. W. Sandwich, superintendent of car service, Atlanta and West Point and the Western Railway of Alabama. Headquarters, Atlanta, Ga.

W. D. Scott, general superintendent, Spokane, Portland & Seattle Railway and the Oregon Trunk Line Railway. Headquarters, Portland, Oregon.

C. H. Shircliffe, superintendent of dining and parlor cars, Chicago and North Western Railway. Headquarters, Chicago, Ill.

Charles H. Stein, superintendent, New Jersey Central and the Lehigh & Susquehanna divisions of the Central of New Jersey. Headquarters, Jersey City, N. J.

J. R. Stem, trainmaster, Chicago, Indianapolis and Louisville Railroad. Headquarters, Lafayette, Ind.

J. P. Stevens, general superintendent, Central general division, Chesapeake and Ohio and the Chesapeake and Ohio of Indiana. Headquarters, Huntington, W. Va.

M. W. Sullivan, assistant trainmaster, Pennsylvania Lines. Headquarters, Oneonta, New York.

John T. Taffany, trainmaster, Erie Railroad. Headquarters, Buffalo, N. Y.

B. E. Terpning, superintendent, East Iowa division, Chicago and North Western. Headquarters, Belle Blaine, Iowa.

F. J. Thomure, general manager, Mississippi River and Bonne Terre Railway. Headquarters, Bonne Terre, Mo.

Henry W. Thornton, general manager, Great Eastern Railway of England. Headquarters, London.

George F. Turley, general manager, Virginia-Carolina Railway and the New River, Holston and Western R. R. Headquarters, Abington, Va.

A. E. Walker, superintendent, Louisiana division, Chicago, Rock Island and Pacific Railway. Headquarters, Eldorado, Ark.

William Walliser, assistant to general manager, Chicago and North Western Ry. Headquarters, Chicago, Ill.

O. T. Waring, superintendent, Waycross district, Atlantic Coast Line. Headquarters, Waycross, Ga.

F. G. White, signal engineer, Chicago Great Western Railroad. Headquarters, Chicago, Ill.

E. Wilson, superintendent, Fort Worth division, International and Great Northern Ry. Headquarters, Mart, Texas.

Samuel B. Zartman, superintendent, New Jersey Southern division of the Central of New Jersey. Headquarters, East Long Branch, N. J.

Traffic.

W. H. Abel, assistant passenger traffic manager, Chicago and Alton Railroad. Headquarters, St. Louis, Mo.

W. H. Alexander, assistant general freight agent, Missouri Pacific Iron Mountain System. Headquarters, St. Louis, Mo.

C. M. Andrews, traveling freight and passenger agent, Southern Pacific Company. Headquarters, Seattle, Wash.

H. E. Arnold, commercial agent, New York Central and Hudson River and the West Shore. Headquarters, Lowell, Mass.

W. S. Battle, Jr., assistant general claim agent, Norfolk and Western Railway. Headquarters, Roanoke, Va.

N. A. Beach, commercial agent, Missouri Pacific-Iron Mountain System. Headquarters, St. Joseph, Mo.

W. L. Bettis, agent, Baltimore and Ohio, and Cincinnati, Hamilton and Dayton Lines. Headquarters, Georgia, Ind.

J. P. Billups, general passenger agent, Georgia Railroad. Headquarters, Augusta, Ga.

D. W. Bird, commercial agent, Louisiana & Arkansas Railway. Headquarters, Little Rock, Ark.

J. H. Boodro, traveling freight agent, Illinois Central Railroad. Headquarters, Carbondale, Ill.

S. W. Bradford, commercial agent, Missouri Pacific, Iron Mountain & Southern, Denver & Rio Grande and Western Pacific Railways. Headquarters, Texarkana, Ark.-Tex.

F. G. Browder, Jr., assistant general freight agent, Atlanta and West Point R. R. and the Western Railway of Alabama. Headquarters, Montgomery, Ala.

F. W. Brown, traffic manager, San Francisco-Oakland Terminal Rys. Headquarters, Oakland, Cal.

Orno M. Brown, contracting agent, El Paso and Southwestern System. Headquarters, Chicago, Ill.

Z. T. Bynum, Jr., soliciting freight agent, Norfolk and Western Railway. Headquarters, Winston-Salem, N. C.

Nathan G. Campbell, general agent, Central Railroad of New Jersey. Headquarters, Newark, N. J.

W. N. Carmody, commercial agent, Missouri Pacific-Iron Mountain System. Headquarters, Fort Scott, Kansas.

C. L. Chapman, assistant general traffic manager, the Erie. Headquarters, New York.

Robert Charlton, commercial agent, Minneapolis and St. Louis Railroad. Headquarters, Duluth, Minn.

R. M. Chastain, commercial freight agent, Missouri Pacific, St. Louis, Iron Mountain and Southern, Denver & Rio Grande and the Western Pacific Railways. Headquarters, Monroe, La.

Asa B. Clark, division freight agent, the Erie Railroad. Headquarters, New York City.

E. R. Coleman, division freight agent, Pittsburgh, Cincinnati, Chicago and St. Louis. Headquarters, Cincinnati, Ohio.

John P. Collins, traveling freight agent, New York Central and Hudson River and the West Shore. Headquarters, Lowell, Mass.

T. B. Coppage, superintendent of transportation, St. Louis and San Francisco Railroad. Headquarters, Springfield, Mo.

John N. Cornatzer, general passenger agent, St. Louis and San Francisco. Headquarters, Memphis, Tenn.

George H. Cornell, traveling passenger agent, Southern Pacific Company. Headquarters, Los Angeles, Cal.

J. D. Cornell, general freight and passenger agent, Rock Island Southern Railway. Headquarters, Davenport, Iowa.

D. M. Crawford, commercial agent, Grand Trunk Railway System. Headquarters, Pittsburgh, Pa.

R. B. Crocker, traveling freight and passenger agent, El Paso and Southwestern System. Headquarters, Chicago, Ill.

J. M. Crute, assistant general freight and passenger agent, Ocilla Southern Railroad. Headquarters, Ocilla, Ga.

D. A. Davies, commercial agent, El Paso and Southwestern System. Headquarters, Detroit, Mich.

S. E. Dewey, commercial agent, Grand Trunk Railway System. Headquarters, New York.

G. H. Dougherty, soliciting freight agent, Kansas City Southern Railway. Headquarters, Beaumont, Texas.

G. W. Feakins, general agent, El Paso & Southwestern Railroad. Headquarters, St. Louis, Mo.

C. L. Ferrall, division freight agent, Pennsylvania Company. Headquarters, Cambridge, Ohio.

Edward R. Ferry, general agent, Illinois Central Railroad and the Yazoo and Mississippi Valley Railroad. Headquarters, New Orleans, La.

Frank Fouts, general agent, Denver and Rio Grande Railroad. Headquarters, Ogden, Utah.

A. J. Fox, assistant general freight agent, Seaboard Air Line. Headquarters, Jacksonville, Fla.

C. A. Francois, contracting freight agent, Illinois Central Railroad. Headquarters, Minneapolis, Minn.

F. Davidson, purchasing agent, Chicago, Indianapolis and Louisville Ry.

C. T. Tillman, purchasing agent, South Georgia. Headquarters, Quitman, Ga.

Miscellaneous.

Winthrop M. Daniels, member, Interstate Commerce Commission.

Henry Clay Hall, member, Interstate Commerce Commission.

T. H. Hayes, chief clerk, president's office, Chicago, Indianapolis and Louisville Ry.

R. D. Rynder, chief examiner for the Interstate Commerce Commission.

George N. Brown, examiner, Interstate Commerce Commission.

RESIGNATIONS.

Executive.

W. G. Bierd, vice-president and general manager, Minneapolis and St. Louis Railroad.

Daniel Breck, vice-president and general manager, Missouri, Oklahoma and Gulf Railway.

Howard Elliott, chairman and member of the board of directors, Boston and Maine Railroad.

Morris McDonald, president, Boston and Maine Railroad.

J. K. Moffit, president, San Francisco-Oakland Terminal Railways.

A. H. Payson, president, Northwestern Pacific Railroad.

Frank A. Peil, assistant to president and assistant secretary, Portland and Seattle Railway.

John P. Ramsey, president, Chicago, Peoria & St. Louis Railway.

Joseph Wood, first vice-president, Pennsylvania Lines West of Pittsburgh.

B. A. Worthington, president, Chicago and Alton.

Legal.

C. E. Benton, general attorney, Missouri Pacific Railway.

Financial.

W. W. Charles, assistant treasurer, Tonopah and Goldfield Railroad.

Accounting.

F. C. Anderson, auditor, Missouri, Kansas and Texas Railway.

C. C. Barry, assistant controller, Southern Pacific Company.

T. B. Cowper, auditor, Danville and Western Railway.

C. C. Moore, auditor, Houston and Brazos Valley Railroad.

E. F. Pool, controller, Nashville, Chattanooga & St. Louis Ry.

F. W. Pope, auditor of receipts, Missouri, Kansas and Texas Railway.

W. T. Rowen, auditor of freight accounts, Southern Pacific Company.

J. C. Vison, auditor of miscellaneous accounts, Southern Pacific Company.

R. E. Williams, auditor, Texas and Pacific Railway.

Engineering and Mechanical.

F. S. Anthony, mechanical superintendent, Texas and Pacific Railway.

William G. Atwood, chief engineer, Lake Erie and Western and the Northern Ohio Railroad.

Joseph Beaumont, engineer of signals, Chicago Great Western Railroad.

H. Bortin, assistant engineer in charge of valuation, Union Pacific Company.

G. H. Bremner, engineer, Illinois district, Chicago, Burlington and Quincy Railroad.

G. H. Cumberland, division engineer, Oregon Short Line.

H. H. Decker, engineer of maintenance, lines east of the Missouri River, Chicago and North Western.

D. F. Fitzgerald, assistant superintendent of motive power, St. Louis and San Francisco Railroad.

R. B. Gandy, division engineer, Alabama division, Seaboard Air Line.

G. H. Hopkins, master mechanic, Oregon Electric and the United Railways.

DIVIDEND NOTICES.

Philadelphia Electric Company, 419 Market Street, Camden, N. J., February 17, 1914.

The Board of Directors have this day declared a quarterly dividend of one and three-quarters (1¾) per cent (being 39.375 cents a share) upon the paid in capital of the Company, payable March 14, 1914, to stockholders of record February 21, 1914.

Freight Rates

STUDIES IN RATE CONSTRUCTION

By John P. Curran.

(Of the Central Freight Association.)

Years of Experience Boiled down in 367 pp.

This new book, the first of its kind ever published, tells **why the rates are in the tariffs** and **how** to find and use them. It explains the GROUP RELATION THEORY, THE DIFFERENTIAL BASIS, THE BASING POINT SYSTEM, THE MILEAGE SCALE, ETC. It is illustrated by current rate applications.

HOW ARE FREIGHT RATES MADE?

The answer to this question, answers also how markets are made.

"I have been in the rate game for thirty years but I never learned half of the rate-bases plainly explained in that book," said a prominent rate-man recently.

This new work is endorsed by leading traffic experts throughout the United States and Canada. ORDER YOUR COPY TO-DAY.

LIMITED EDITION—$5 POSTPAID.

10% discount when remittance accompanies the order.

Size—6x9, 367 pages, silk cloth binding.

THE WOODING AUTOMATIC TRAIN STOP

This device is recognized by all Engineers as being far superior to any *other*.

It is operated by the **closed electrical circuit** which is the **only reliable means** for operating **any** automatic device. This *necessitates* a **contact.**

Our contact is a **covered split rail.** It is the **smallest,** gives the **greatest clearance,** makes the **best contact,** and is **weather-proof.**

The train contact is a strong ***steel blade*** that offers the **least** obstruction and **makes** the **best knife blade electrical connection.**

All agree *that the* ***wrecks*** *on roads* **equipped** with the **block signals are due** to the **human failure, demonstrating positively** the **reliability** and **necessity** for the **automatic train stop.**

Our Government for the people says through the Interstate Commerce Commission that the **automatic train stop** is the **only way to prevent wrecks.**

If indemnity in **case** of **accidents** can be **secured** against a railroad on the **ground** of ***negligence*** *in not having* the block signal installed, as shown in the February edition of the Signal Engineer, **what chance has** a road to **escape** the **greater penalty** *for not* ***installing*** the **Automatic Train Stop which** is the **universally recognized protection?**

The automatic train stop has proven to be the **greatest** ***desciplinarian.*** It **protects** the **long faithful employees** from the **mistakes** they **naturally will make,** and *the* ***employer*** from the **loss** of **his best men** in trying to effect the **present** day **impractical** discipline.

Our device can be *installed* at a **minimum expense** in the **closed circuits** of the present day unreliable distant signalling system and **make** it **absolutely safe, or** independently, including *local signals* superior to the present block system, for **one-half** the **cost** of the latter.

This device is a **convenience,** and a **practical insurance *against* accidents** that **no railroad** can **afford to be without.**

We stand ready to demonstrate *every claim* made for our device on any railroad at our own expense.

Important Developments in the Transportation Field

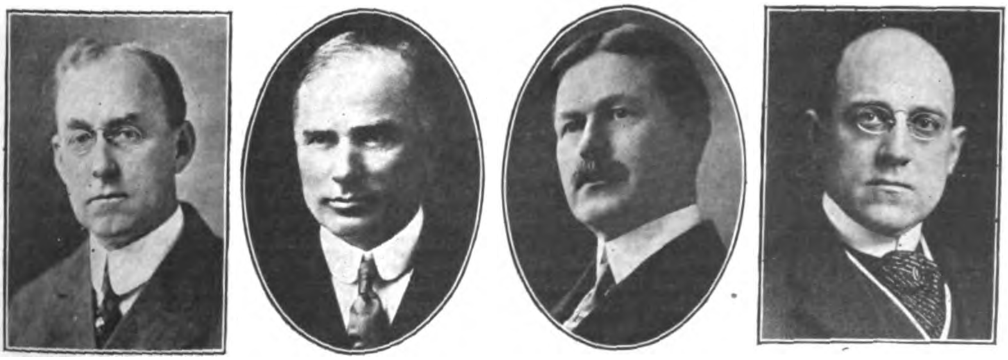
ANNUAL BANQUET OF PITTSBURGH TRAFFIC CLUB

The twelfth annual banquet of the Traffic Club of Pittsburgh which was held on the evening of March 27th, proved to be by far the most notable and brilliant function yet held by this progressive organization. Guests were present from practically all parts of the United States and from abroad. The decorative effects were superb. The speakers' table occupied the stage of the hall, the front being transformed into the semblance of a garden wall over which climbed flowering vines, while the back was a trellis, also carrying vines. Surmounting all was a key, the Club's emblem, outlined in electric lights. At either end of the table, was a magnificent basket of roses with a bed of tulips extending from end to end, through the center. Each of the sixty-odd tables for Club members and their guests, placed on the main floor, bore a large basket of luscious fruit, while delicate greenery decorated the cloth, the effect produced being at once novel and beautiful. The balcony and corners of the room were banked with ferns, palms and potted plants, while cut flowers were everywhere in profusion. President Elmer C. Sattley presided, and Dr. Francis Harvey Green, of the West Chester Normal School, acted as toastmaster. The principal speakers of the evening were Daniel Willard, president of the Baltimore and Ohio Railroad Company, and John Barrett, director-general of the Pan-American Union.

After the banquet, Mr. Sattley opened the proceedings by briefly extending a cordial greeting to those present. He spoke of the assemblage as being so magnificent in its representation as to be almost awe inspiring.

In introducing the speakers of the evening, Dr. Green called attention to that sentence from some unknown source which says: "He who writes the history of civilization will write the history of transportation." Continuing, he said:

> You gentlemen are the civilizing forces of mankind, you are men that make things go; you are people whose "back bone comes to the front; you are men obedient to the injunction savoring somewhat of slang but none the less impressive, "Get a move on, get busy, step lively and watch your step." Such people are the ones most worth while to the world. "The busy world shoves angrily aside the man who stands with arms akimbo and waits occasion to tell him what to do."
>
> It is well worth while, however, in the midst of the hurry and rush of life for business men to assemble on occasions of this sort and touch elbows with each other in a genial happy mood with the strain and stress of business for the time being largely thrown off. Blessed is it when "good fellows get together," and in a friendly spirit join in having a jolly time. Another thing that leads me to like to mingle with men of the type that makes up this group is that there is so much of the element of unselfishness about your work. You remember the other fellow and



FRANCIS H. GREEN. DANIEL WILLARD. ELMER C. SATTLEY. JOHN BARRETT.

Men who took a prominent part at the 12th Annual Banquet of the Traffic Club of Pittsburgh, held on the evening of March 27th.

reach out a hand of helpfulness toward him. Selfishness is as much hell as war.

He then introduced President Willard of the Baltimore and Ohio, and the spontaneous burst of applause which greeted this popular chief executive must have left no doubt in his heart as to the esteem in which he is held by those who are best able to judge of the manner in which he has disposed of his heavy responsibilities since becoming the head of one of the Nation's greatest transportation systems.

The immediate and pressing necessities of the railroads, constituted the theme of President Willard's address, and upon it he predicated a strong and earnest plea for higher rates for transporting freight. His argument, fortified by statistical data, appeared incontrovertible.

He said in part:

"In the present rate case it has been shown that 35 roads in official classification territory have actually added to their property investment since 1910, for additional facilities and equipment, over $659,000,000, but as a result of operations in 1913, although the gross earnings of the 35 railroads were $186,775,000 greater than in 1910, the net earnings after paying operating expenses and taxes, were actually $16,311,000 less than in 1910, showing that not only had these particular companies failed to earn any return whatever upon the new capital invested, but they actually had $16,311,000 less net as return upon their previous investment, than was the case before the large additional amount of money had been put into the plant, and of course it is unnecessary to say to you, as business men, that no business enterprise can continue on such basis,

"Men having money to invest will not put it in railroads unless they believe that money so invested will upon the whole bring as safe and satisfactory return as might be expected if invested in other directions, and railroad investments must be made sufficiently attractive to secure new capital, else development, which means new cars, new engines, new stations, new tracks and other facilities will cease, and nothing can more effectually check, if not absolutely stop the growth of commerce than insufficient transportation facilities.

"How may the new capital needed be obtained? How may railroad investments be made attractive? By permitting the railroads to impose such reasonable charges for service performed as will, with economical and intelligent operation, yield sufficient net to pay fair and reasonable return upon the capital required.

"It has been frequently stated that the railroads, or at least some of them, are incompetently and dishonestly managed.* It has developed in certain instances, I regret to say, that men holding official positions with railroads have been unfaithful to their trusts; conditions of extravagance have developed in localities, and uneconomical methods have been disclosed. However, as matters exist to-day, the railroads are obliged to keep their accounts in accordance with methods prescribed by the Interstate Commerce Commission. Under such conditions, it is practically impossible for dishonest methods to be followed for any considerable length of time without detection, and in this connection I wish to state in the strongest manner possible that in my opinion there is no more efficient, high minded or honorable body of men to be found anywhere, than those who to-day constitute the official staff of the American railroads.

"I do not claim they are better than other men; I do assert, however, that they are just as good, and my belief is based upon an intimate knowledge of an acquaintanceship with the men in mind of more than thirty years' duration. * * *

"It should be remembered that the railroad, quite unlike the ordinary manufacturing or business enterprise, extends over many miles of country, and its operations on that account are extremely difficult to supervise; and because of its public character the railroad is constantly required to sacrifice economy in the interest of safety, dispatch or the commercial requirements of the service. All of these features make it difficult to obtain such economy and efficiency in service as might otherwise be expected. They do not make efficiency or economy impossible, but they do make both more difficult, and in any event, the efficiency of American railroads, has been a matter of amazement to the railroad managers and students of economies from every country in the world. It is possible that further economies will be effected in the cost of transportation. It is certain, however, that the demands of commerce, of labor, of the regulating bodies and of the people themselves, expressed in various ways, will continue to add to the cost of operation, and it is doubtful if all the further economies possible, will be sufficient to offset the increase to be expected from the causes just mentioned.

"I would like to say just a word before I close about the present attitude of the press towards the railroads. Four years ago, when the eastern carriers endeavored to advance freight rates, the press was generally opposed to the movement; to-day, however, it is practically unanimous in support of the railroads' position, and this change of attitude has been much commented upon and much misunderstood. It has been said, for instance, in the halls of Congress that all manner of schemes have been worked to create public sentiment favorable to the increase of railroad rates. That efforts have been made to create a sentiment favorable to the railroads in the present rate matter, I will not deny. I do assert, however, and as chairman of the president's committee I am in position to know, that such efforts have been confined to the very simple procedure of presenting the facts.

"The railroads have been criticized in the past, and perhaps rightly so, for not taking the public into their confidence. In the present case we have tried, I have tried, others have tried, to do the thing that we have been criticized for not doing in former years. We have stated our case to the public, and we have done so because we have felt that it was a matter in which the public was largely interested and concerning which it ought to be informed; and, while it is not to be presumed that the Interstate Commerce Commission will be or should be influenced by public opinion, still the Commission, because it also is the servant of the public, has the right to know the

> public's view concerning a matter of such prime importance. If the press in a large sense truly represents public opinion—and I sincerely believe it does—then the carriers may well feel gratified by the attitude of the public in the present case."

The address of the Honorable John Barrett, director-general of the Pan-American Union, delivered, as it was, in a highly optimistic vein, caught the fancy of his auditors, as, in the guise of prophet, the genial director-general visualized a wonderful and prosperous future for the railroads when the Panama Canal, opening the vast countries and resources to our south, shall stimulate traffic between these continents and between the United States and other foreign nations in a manner never before anticipated.

He warned the railroads and shippers of the country to be ready to take advantage of the great opportunities which would be afforded by the opening of this waterway, and said in part:

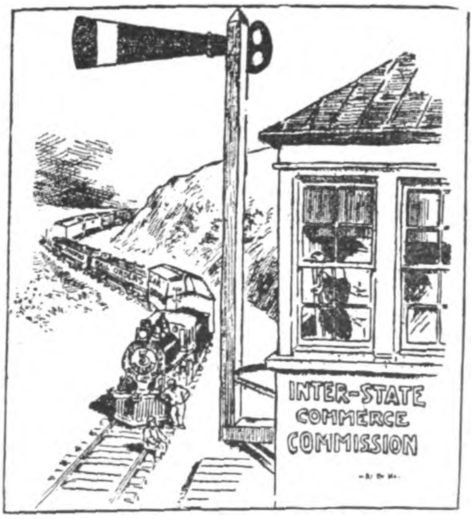
> The Panama Canal will have a great influence upon the railroads of the United States. That this influence will be favorable I am convinced. It is no exaggeration, in my opinion, to state that the traffic which should develop through the Panama Canal will prove a boon to the railroads of the Atlantic and Pacific Coasts, and central sections of the United States.
>
> At first the transcontinental systems or their sections between the Mississippi Valley and the Pacific Coast may suffer from the competition of the canal, especially in the bulky class of freight, but in the course of a few years what they will lose in this respect will be more than counterbalanced by their growth of business in the increased prosperity of both the Pacific Coast and the Western portion of the Central West. In other words, in the course of five years the increased development of local business which will come indirectly from the opening of the canal will far more than make up for the loss of the heavy through business.
>
> The possibilities of the Panama Canal and of Pan-American commerce are to-day the greatest foreign problems and opportunities which confront railroad and business interests of the United States. Getting ready for the Panama Canal and going after Pan-American and Pacific trade should be the special study of this hour of every railroad system and of every manufacturing company which in anyway is concerned with export business. The railroads in every part of the land should join with commercial organizations and civic societies in not only studying the meaning and possibilities of the canal, and of the commerce which it will develop, but in actively and actually preparing to use the canal to send exports out, bring imports back, and, above all things, to meet the competition of such countries as England, Germany and France and Europe and Japan and Asia.
>
> I can tell you that there is not a great port or exporting or importing center of Europe, of Japan, of Australia, and of Northern and Western South America, that is not to-day doing more to get ready for the Panama Canal than our corresponding ports and centers of the United States, with the possible exception of New Orleans and San Francisco.

DEVELOPMENTS AT WASHINGTON

The Interstate Commerce Commission, on April first, gave out a definite statement to the effect that they would push the advance rate case to conclusion as rapidly as possible. In other words, it was intimated that all other business would be put aside in order that the case might be disposed of with all possible promptness. This led to its formal closing on April 4, and a decision may now be expected as soon as the Commission has been able to digest the voluminous testimony which has been offered at the long series of hearings.

On April first, both President Willard, of the Baltimore and Ohio, and President Delano, of the Wabash, testified in support of the proposed advances. Mr. Willard asserted that the railroads were facing a crisis which might prove serious to the people of the entire country, as well as to the roads themselves. He and Mr. Delano both declared that the carriers were earning no returns upon heavy investments which they had made in their properties during the last four years.

Some interesting figures regarding recent railway earnings were presented by



WAITING FOR THE SIGNAL.
—*Philadelphia Record.*

Vice-President Brownell of the Erie Railroad. He pointed to the fact that the statement of the revenues and expenses of the carriers for the seven months ending March 31, 1914, showed a decrease in operating revenues amounting to $6,995,529 and a decrease in operating income of over $51,000,000, as compared with the seven months ending January 31, 1913. He also asserted that the return of the roads in Central Freight Association territory for the same period in group one, showed a decrease of $8,178,477 in freight revenues and a decrease in operating income of $25,195,598. This is exclusive of the roads in group two of Central Freight Association, which show a further decrease in operating income of over $4,000,000. Mr. Brownell further pointed out that the returns of revenues and expenses for February and March so far as they are available, are in the same direction and clearly indicate that the condition confronting the carriers at the present time is one of gravity and that it is of vital importance, in the interests of the public as well as the roads, that the question of the propriety of the advance in freight rates, should be decided at the earliest possible day.

Another development of importance during the same week was the suspension, by the Commission, of all new tariffs recently filed by railroads eliminating allowances to industrial railroads, with the exception of those affecting the United States Steel Corporation and other iron and steel companies in the East, which were permitted to stand. Approximately 4,000 tariffs were suspended and the action came as a complete surprise to many, in view of the fact that these tariffs were submitted in compliance with the Commission's findings in the industrial railways case, in which it was held that allowances and division of rates made by trunk lines with certain industrial railways operated by iron and steel companies in Eastern territory were, in effect, rebates and should be discontinued. The order for suspension, which expires July 30th, provides for hearings, but no date has as yet been fixed. Furthermore, it is very probable that these tariffs will be again suspended as, judging from past developments, no case of such magnitude has been disposed of by the Commission in so short a time.

While these suspensions are undoubtedly largely due to the protest from shippers backed by an injunction issued by the Illinois Railroad Commission, it nevertheless remains true that the new tariffs follow the very vigorous argument of Mr. Brandeis, the Commission's attorney, to the effect that the Eastern roads were losing many millions of dollars annually by reason of the allowances made to connecting industrial lines. In filing the tariffs, therefore, the railroads have endeavored to meet the wishes of the Commission which now finds itself in the predicament of having to deal with the protesting shippers who are now largely sustaining the railroads in their former policy.

Never before has the Commission been so squarely on trial before the public bar, than it is at the present time, and its practical value is being put to a most searching test. On the ability of the Commission to decide the advance rate case promptly and justly, depends the faith of the people as never before in quasi-judicial bodies of this kind. A commission that fails to act with necessary promptness, in an acute situation of this character, is of little use to the country, for its work, unless promptly conducted, might as well be done by Congress and the courts.

THE RAILROADS DENIED FAIR PAY FOR CARRYING THE MAILS

Attention was called in last month's issue to the fact that Congress had again failed to do justice to the railways by passing the bill providing for the expenditures of the Postoffice Department for the next fiscal year without making any provision to compensate the railroads for carrying the parcel post.

The situation as it exists to-day could scarcely be worse, and the country is presented with a spectacle of a Government, which on one hand demands absolute integrity of action on the part of the carriers, while on the other hand, it subjects them to a treatment so unfair as to be designated as nothing short of dishonest.

The railroad companies claim that the data compiled by the Postoffice Department itself shows the carriers to be underpaid by $29,000,000 annually for carrying the mails. By their own calculations, they claim to have been underpaid, even before the parcel post was instituted, by at least $15,000,000 per annum. This unjust treatment has existed for many years and it appears practically impossible for the railroads to procure any adequate relief or to get the Government to pay them fairly for the services which they are forced to perform.

A few figures will strikingly uphold this statement. For example, the postal revenues in 1907 were approximately $183,500,000; in 1912 they were somewhat over $246,500,000, an increase in five years of about $63,000,000. As against this, railway mail pay for 1907 was $51,000,000, and, in 1912, slightly over $50,500,000. In other words, the chief factor which enabled the Postoffice Department to earn this increased revenue of $63,000,000, not only did not receive any extra compensation for the additional work performed, but actually suffered a reduction of some $304,000. This, it should be remembered, was before the installation of the parcel post service on January 1, 1913.

The bill referred to, which Congress has recently passed, providing for the expenditures of the Postoffice Department for the next fiscal year, is based upon official estimates of the Postoffice Department that during the next fiscal year the parcel post will probably handle about 600,000,000 packages, yielding a revenue to the Postoffice Department of about $60,000,000. This should mean, in all fairness to the railroads, an increase in the payments made to them for carrying the mails, of at least $12,000,000, for parcel post alone. Nevertheless, the appropriation bill recently passed provides for no increase whatsoever, beyond the trivial and utterly inadequate provision already made. The railroads are given to understand that the whole question is under consideration, and one of these interminable investigations, which appears to be part and parcel of governmental activities, was started as far back as 1909, and has been spasmodically carried on ever since, with the end, as yet, apparently nowhere in sight.

In the meantime, the officials of the Postoffice Department have endeavored to sustain the position taken by the former Post-Master General and by the present incumbent of that position, and have introduced new issues, such as the allegation that the railroads perform a governmental function in carrying the mails and should therefore earn less than a commercial rate. Nevertheless, by the Department's own figures, thus far produced, and by the use of more correct percentages, the underpayment of the railroads by about $29,000,000 per annum, is clearly established.

In view of these figures, and of the fact that calculations have been made on different bases, showing loss to the railroads on this business ranging from $13,000,000 to $37,000,000 per annum, the carriers feel entirely warranted in making the moderate claim that in 1909, the underpay was not less than $15,000,000. Since that time, however, there has not only been a great growth in the mail tonnage, but an entirely new business, the parcel post, has been established and no adequate provision made for reimbursing the carriers for caring for this enormous increase. It should therefore be plainly apparent, even to the layman, that a prompt and satisfactory adjustment of this important question is demanded by every consideration of justice and right.

The Railroad Committee on Railway Mail Pay, in a recently issued bulletin in which it discusses this problem from every angle, calls attention to the fact that it has not failed to give the most thorough consideration to the proposal that space rather than weight, be made the measure of the service rendered, but it is absolutely convinced, by its consideration of the subject, that any such plan would be dangerous to the Government and unsatisfactory to the carriers, principally because of the large amount of discretion, the adjustment would leave to the officers of the Department. As the committee points out: "This conclusion is not inconsistent with the deepest faith of the honesty of the departmental officers, but recognizes the disadvantages of their position under our political form of Government and the opportunities which would present themselves for serious irregularities."

There would at least be frequent occasions for misunderstanding and irritation and these would lead inevitably towards a lack of co-operation, which it is pointed out, should always exist between two National industrial establishments, such as the railroads on the one hand and the postal service on the other. It is little short of deplorable that this whole problem should become befogged by the injection of the consideration of another method under which railway mail pay might be regulated, when the weight basis is so universally admitted to be the only fair one upon which such compensation should be computed.

THE QUESTION OF WAGE INCREASES

One of the arguments advanced by the Eastern carriers, in their efforts to have their freight rates increased, is based on the fact that the wages of railway employes have, in the aggregate, been increased enormously during the past two or three years.

In making these claims, various roads have, from time to time, shown the effect of such increases upon their company's expenditures, but it was not until the recent statement filed by the Eastern roads with the Interstate Commerce Commission, that it became possible to state just what, in the aggregate, these increases amounted to. It appears that the various railroad companies in Eastern territory paid out in wages during the year ending June 30, 1913, $506,000,000. Estimates for twenty-nine of the thirty-eight railroad systems concerned, show an increase in wages for 1913 over 1910 of $48,618,972, due to changes in rates of pay and working conditions.

These figures alone would justify the railroads in requesting that they be permitted promptly to increase their rates and it is perfectly obvious that any other business would make an effort to meet a similar condition by an increase in the selling price of their merchandise. This, however, is only a small part of the problem which confronts the carriers, so far as increased expenditures are concerned. Legislation and regulation have, within the past few years, added enormously to the carriers' financial burdens. Every piece of equipment, whether it is represented in the right-of-way or the rolling stock, must be purchased at a higher rate. Taxes have advanced, and, in fact, practically every item entering into railway operations, represents a larger expenditure than it did a few years ago.

Why the Commission, in view of these facts, permits month after month to roll by without granting the necessary relief, is something very difficult for the laymen to understand. Admitting the necessity for the Commission to have a thorough and comprehensive knowledge of the situation before taking any definite action, the main facts in the controversy have been so well established and have remained practically unrefuted, that the reason for further delay is not apparent. We venture to assert that there is scarcely a shipper who has appeared before the Commission to argue against the rate increases, who does not, in a general way, recognize the justice of the carriers' contentions and desire to see their income increased to such an extent as will enable them to properly conduct their plants. Their opposition relates largely to specific rates or territories, and has no real bearing on the present case.

There may, of course, be certain individual readjustments made necessary, should the Commission grant the horizontal increase of five per cent, but these must, of their own nature, be considered on their individual merits, and should not be permitted to delay the settlement of the main issue. If the press of the country is any criterion, the public is becoming extremely weary of the dilatory tactics so largely in evidence at Washington, and in the meantime, business is largely on the verge of hysteria not knowing which way the cat may jump.

BUSINESS MEN DEFENDING THE EXPRESS COMPANIES

The recent action of Merchants' Association of New York, in coming out in defense of the express companies, is beginning to bear fruit. This attitude, as recorded in last month's issue, is to the effect that there are certain services performed by express companies which would be impossible to attempt by the parcel post and to wantonly destroy such service would constitute an inexcusable blunder on the part of the Government to say nothing of the injury which would be done to the general public, to the express companies and to the investors in express companies' securities.

Other organizations are now voicing their opposition to a further extension of the parcel post at the present time, and by resolutions are clearly indicating their disapproval of further governmental action tending to cripple or destroy the express service. The Chicago Association of Commerce, the most powerful organization in the Middle West, following the action of the Merchants' Association of New York, and upon recommendation of its Freight Committee, has adopted a resolution which urges the Postmaster General, for a reasonable period, to make no radical change in the parcel post regulations, to the end that commerce may have an opportunity to shape itself to present conditions and secure the benefit of a relative adjustment in the forwarding of small packages by freight, by parcel post and by express.

The Board of Trade of Peekskill, New York, has indorsed and approved by a unanimous vote, the position taken by the Merchants' Association of New York, while the Board of Directors of the Albany Chamber of Commerce, have passed a resolution to the effect that in their opinion no social or economic benefit will result from substituting the parcel post for the express service beyond the limit now established, but that on the contrary, serious harm to the country's traffic would ensue with a probable loss resulting from the parcel post operation to be borne by the public treasury.

Other organizations have taken, or are about to take, similar action. The Business Association of Evansville, Ind., through its secretary, writes that their organization agrees with the New York Chamber of Commerce that the express service should be preserved, as it is essential to the expeditious handling of goods. The secretary of the Bainbridge, Ga., Board of Trade, while criticising the express companies for some of their past acts, expresses the opinion that sober thought must show that the express service is a field which cannot be filled by the parcel post, and that this is a matter which concerns everyone. The Tile Manufacturers 'Association with headquarters at Beaver Falls, Pa., has taken action opposing the proposed increase in the weight of parcel post shipments and has protested both to the Postmaster General and to the members of Congress, who represent the district.

In addition to these protests by trade bodies, the press of the country, through editorial expression, is supporting the position taken by these organizations, and many of them are caustically criticising the Government for its apparent indifference towards the welfare of business enterprises.

As a matter of fact, the attitude of the Postoffice Department with regard to the promotion of the parcel post, has been little short of brutal, not only showing an utter disregard for the rights of others, but in making congratulatory statements concerning the earnings of the Department, when it is considered that such earnings, to a large extent, are based upon a clean steal from the transportation interests, it places itself in such a contemptible position as to forfeit the respect of all right thinking people.

In the meantime, the directors of the United States Express Company voted definitely on March 14th, to wind up its affairs and go out of business. This means throwing 15,000 employes of this company out of work. The yearly pay roll is about $6,000,000. The following is the resolution of the directors which means the dissolution of the company:

> "Resolved, That pursuant to the power and authority conferred upon the Board of Directors by its articles of association, the Board unanimously declares that it is for the best interests of the company that the company be dissolved as soon as may be without awaiting the expiration of its term of existence; and that its business and affairs be settled up and finally adjusted as promptly as may be done. The President is directed to inform the shareholders of the company of said action of the Board."

. In commenting on the action taken by the Board of Directors, President Roberts has had the following to say:

> "We could have stood the competition of the parcel post as originally planned, but we cannot stand it as at present constituted, when it is carrying parcels of almost unlimited weight. We would have continued in business if the makers of the parcels post had not threatened to extend it to consume the express business, increasing the weight of parcels carried and reducing the rates.
>
> "When the parcels post started, we recognized that it filled a long felt want that the express companies could never meet. It would always be impossible for us to make rural deliveries. This the parcels post could do.
>
> "Our action, however, is not based on the competition of the parcels post, but chiefly because of the new heavy reduction in rates that went into effect on February 1st, on top of the parcels post competition.
>
> "And it is not only from the new rates ordered by the Interstate Commerce Commission that we suffered. It was from the hounding by State Rate Commissions.
>
> "Why, only yesterday, the Railroad Commission of Louisiana, issued a peremptory order that we lower some of the intrastate rates.
>
> "We could have lived and prospered under the original parcels post, but under these new conditions it is impossible. And the railroads are just as seriously affected by the reduction of rates as the express companies."

President Roberts told of the valiant struggle the company had made in the last year to economize and cut down so that it could continue to live. Mr. Roberts entered the company from the Delaware and Hudson Railroad on January 1, 1913. He brought from Washington as his assistant W. D. McLean, an experienced corporation lawyer and efficiency expert, who brought G. G. Thompson, chief clerk of the Postoffice Department at Washington, into the company to help carry out the plan of efficiency. Buying was centralized, methods of handling express accounting were improved, equipment was thoroughly overhauled and put in better shape than for many years.

"As the result of economies," said President Roberts, "we turned a loss of $121,000 in January, 1913, into a profit of $5,600 in January of this year. But we cannot continue to reduce expenses forever. When you come to cutting off 16 per cent more of our revenues as happened when the Commission ordered the reduced rates February 1, it meant that conditions were threatening. We would have had to increase our gross business 25 per cent to break even."

Surely, the time to call a halt has come. When the Postoffice Department has succeeded in making some arrangement whereby the railways may be adequately compensated for the vast additional service which they have recently been called upon to perform, then the consideration at least, of a further extension of the parcel post, might be proper. Any other action under existing conditions would be indecent and certainly would not be justified by any consideration of fair play or common honesty.

•

REDUCTIONS IN WORKING FORCE

A peculiar twist in the public mind, is represented in the severe criticisms aimed at the railroads for reducing their working forces in an effort to curtail expenses. In other business this would be considered a necessary and legitimate act and certainly no sympathy would be wasted on the man foolhardy enough to jeopardize his whole business as well as those affected by its success, by retaining the services of certain employes for whom, under a restricted output, there was no longer justified employment.

While the trend of recent events is hopeful in the direction of a fairer consideration of the obligations society owes to the working man, it is nevertheless true that charity and business, under existing conditions, cannot be combined without jeopardizing the success of the latter. This would not imply that such developments as pensions, shorter working hours, improved sanitary conditions and a better appreciation of the workingman's value, are not rightfully part of present-day business methods. They should be, and are in fact, beginning to constitute no unimportant part of the real success of business enterprises. Such considerations, however, are entirely foreign to the employment of men, when conditions render their services no longer necessary. While railway officials personally desire to assist employes, who through stress of circumstances are dropped from the service, it should not be overlooked that in the conduct of affairs they have other responsibilities more imperative and which, in accepting their positions, they have agreed to discharge to the best of their ability.

During the present winter months, the railroads have reported decreases in their earnings due to a lesser volume being offered for shipments. This is the effect, chiefly, of many of the larger industries operating on reduced output schedules. While this decreased production has been reflected in the gross receipts of the railroads, by far the most discouraging factor has been in the steady rise in the cost of operation, which has depleted the net earnings account to a serious degree. Therefore, the railroads in adjusting their transportation machines to this new situation have been compelled to reduce their forces to such an extent as will enable the handling of the business without inconvenience to shippers, but with greatest efficiency from the standpoint of transportation. This has been the situation forced upon the carriers for which they should in no wise be held responsible.

It is quite true, as currently reported, that the reduction of forces has often extended to all branches of the service. However, with less traffic to be handled it should be readily appreciated that fewer train and terminal employes are required and this has made imperative the necessity for laying off, at least temporarily, large numbers of such employes. Furthermore, with less trains in operation, the work in the shops was cut down and employes were dropped in the maintenance of way department and other branches of the operating departments. In all these reductions, however, the strictest consideration has been given to the element of safe operation, but it can readily be seen that with less business, the ratio of safety can be maintained with fewer employes.

The assertion made in some quarters, that these reductions have been made for political effect, is not worthy of consideration. The railroads are confronted with the hard facts of smaller earnings and relatively larger expenses, and are attempting to meet the situation in a manner they believe is best suited to protect the properties entrusted to their care. If legislators, who are prone to thrust expensive legislation upon the carriers, with little regard either to its necessity or utility, would rise above political influence, and deal with these matters in a spirit of fairness and independence, the railroads would not be compelled to resort to such drastic measures; and if the body of National regulators now considering the question of permitting the railways to slightly increase their freight rates, would find it possible to grant the relief asked for more promptly, this too would undoubtedly assist railway officials to alleviate conditions which they regret even more than does the public, but for which they are assuredly not responsible.

Regarding the recent action taken by the Pennsylvania Railroad in extensively reducing its operating force, the following statement authorized by President Samuel Rea on March 30th is of interest:

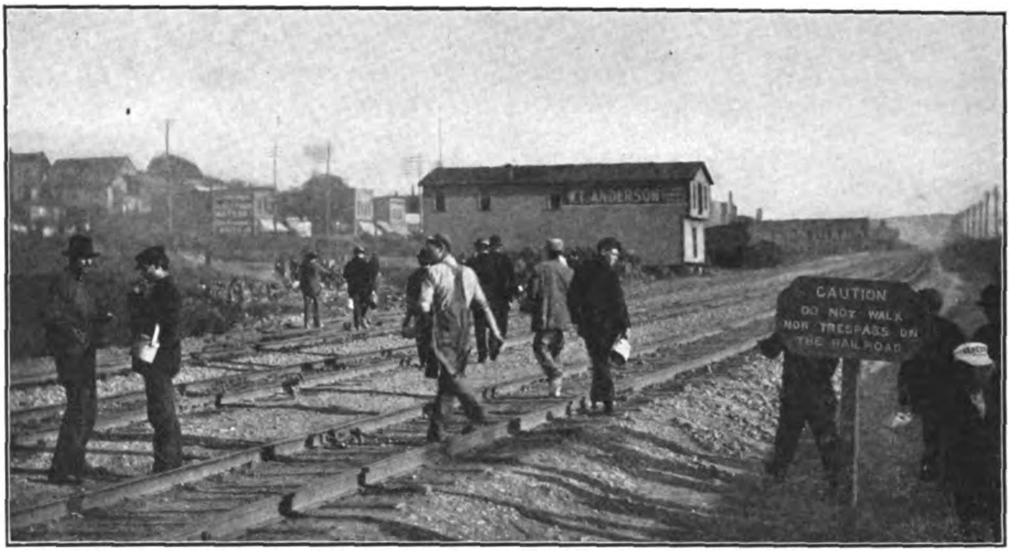
> The decision to reduce train service and working forces of the Pennsylvania System, while apparently sudden, should not be considered surprising, as the published monthly statements of the System furnished to both State and Interstate Commerce Commissions, have shown the large decreases in net operating income the System has sustained. Higher wages, extra crew and other laws, higher taxes, and other expense items caused these decreases, which are not peculiar to the Pennsylvania Railroad. These causes still exist and in addition the gross revenues of the System have been steadily decreasing since last October.
>
> While many other railroad systems began to reduce forces in the middle of 1913, the Pennsylvania System continued its usual train service and working force as long as possible.
>
> In view of the fact, however, that in the four months ending February 28th, 1914, compared with the same period of the previous year, operating revenues decreased $8,815,991.17 and net operating income decreased $6,652,671.29, the Company is compelled to reduce operating expenses.
>
> The management of the Company would not adopt any policy that would unnecessarily inconvenience the public, allow the property to depreciate or deprive men of employment unless required by existing conditions. But the falling off in earnings and traffic demands lower operating expenses, and the only way to bring this about is to reduce train service and the number of employes.

It is an easy matter to say that the railroads should do this and that the railroads should do that, but it is about time that railway affairs receive prompt and fair consideration on the part of regulative authorities, or else business is likely to receive a shock which will cause it to begin a vigorous housecleaning, so far as the body politic is concerned. In the meantime, thousands of perfectly innocent people may be made to suffer, but this unfortunately often appears to be the price of progress.

THE TRESPASSING EVIL

It would be impossible to over-estimate the deplorable results which come from the illegitimate use of railway right-of-way by pedestrians. For a number of years many of the prominent roads have been making strong efforts to arouse public sentiment against this dangerous habit. Many States have laws fully able to cope with the situation, but conditions are such that it appears almost impossible to procure convictions of a character which would prove of sufficient warning to check the practice. There has, of course, been some improvement within the last few years, but with the press clamoring against railway accidents and with public officials often severely arraigning the carriers for such accidents, there appears something radically wrong in a governmental system which permits trespassing, with its resultant loss in life, to go on year after year, practically unabated.

Take, for example, a recent statement issued by the Pennsylvania Railroad. It appears that on this system, east of Pittsburgh, 2,697 trespassers were killed in the years from 1907 to 1913 inclusive, despite the fact that the road was doing everything in its power to keep from its tracks those persons who were not in its employ. This death roll means that the country lost economically, the services of many trained and useful men for, of those killed, 1,318 were useful members of some community, often having dependent families. Among this number, aside from twenty-four boys, twenty-three girls and one hundred and twenty women, there were three hundred and ten laborers, two hundred and twelve miners, twenty-five employes of other railroads, twenty-five farmers, sixteen blacksmiths, seventeen carpenters, seventeen glass workers, seven engineers, seven iron workers, eleven machinists, thirteen masons, twelve steel workers, six students, nine painters and representatives of almost every known trade and profession. Truly an awful record and surely enough to make those

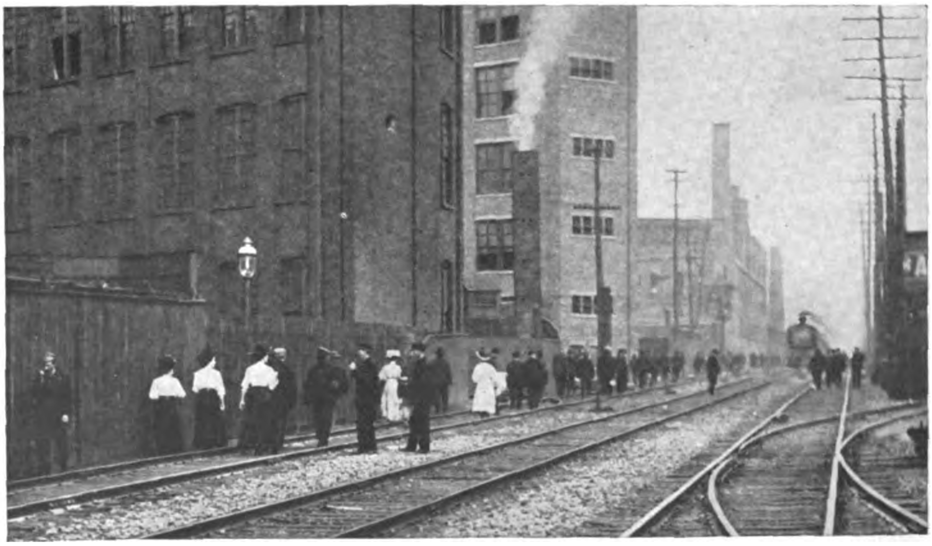


How Trespassers Disregard Warnings.

These workmen have just left the factory and are on their way home. This short cut to home frequently proves a short cut to possible injury and death.

who occupy seats of responsibility, sit up and take notice. It might well be asked of these self-same government officials who is responsible for the deaths of more than 85,000 railway trespassers in the past twenty years. Certainly not the carriers, who have been, and are doing, all that lies within their power to check the practice.

It is admitted that this kind of regulation is not of the popular brand, as the public is loath to give up what it considers a convenience in the employment of railway tracks for sidewalks, but in view of the record, is it not about time for public officials who are immediately responsible for these conditions, to take measures by which they can be effectually suppressed? The accompanying illustrations scarcely require comment. It is just such practices that swell the death roll referred to.



Trespassers Courting Death.

Factory employes making a foot path out of the railroad. This picture was taken at 5.05 P. M., in Cleveland, Ohio, on the tracks of the Pennsylvania Lines. A passenger train was approaching from the south while these people were trespassing.

AGREEMENT REACHED IN NEW HAVEN SYSTEM'S DISSOLUTION

The efforts of Chairman Elliott and his Board of Directors, to find a common basis upon which the New Haven System and the Government authorities at Washington could work out a practical plan of dissolution, have been crowned with success. During the past few months, the proposed plans have been the subject of a series of conferences between the railroad officials of the company and the Department of Justice, the results of which have been embodied in an agreement consummated between the two parties on March 26th. In referring to the agreement reached, Chairman Elliott has made the following public statement:

"In the judgment of the directors the general business and financial condition in New England, and particularly those affecting the transportation lines, were such that it seemed wiser to make a settlement, 'if possible, rather than face a general dissolution suit, with all of its ramifications and uncertainties. The directors feel that the time allowed, with the right in the court to extend it upon application of the company, or of the liquidators, give an opportunity for disposing of the various properties to the best advantage possible and with the least disturbance to general business conditions. A meeting will be called in the very near future for that purpose. Prior to that meeting a statement will be submitted to each stockholder outlining the situation."

Directors of the New York, New Haven and Hartford at a meeting in New York City, March 25, unanimously approved of the agreement reached between Chairman Howard Elliott and Attorney General McReynolds, under which the New Haven System is to disintegrate. Chairman Elliott was authorized to call a special meeting of the stockholders in New Haven, April 21st, when formal action on the agreement will be taken.

Officials of the road believe that the compact, terms and conditions of which follow, will be ratified by a large majority vote.

"The attorney general has indicated to the representatives of the New York, New Haven & Hartford Railroad the arrangements which he thinks would result in bringing the affairs of that company into harmony with the law. The representatives of the railroad are willing tc accept the requirements indicated and to endeavor to put them into effect without delay if approved by the stockholders in a meeting to be called at once. The indicated arrangement stated in general terms follow:

"1. The Boston Railroad Holding Company is a Massachusetts corporation, holding a majority of the stock of the Boston & Maine Railroad and ninety per cent of the former stock, in turn, is owned by the New Haven Railroad. The character of the holding company prohibits it from disposing of the Boston & Maine stock. The legislature of Massachusetts will be asked to remove this prohibition, and, if this is done, the stock of the holding company will be transferred at once to five trustees, and, after arrangements have been made to protect the minority stockholders of the company, they shall sell the Boston & Maine stock prior to January 1, 1917.

"2. The stocks of the companies which control the Connecticut and Rhole Island trolleys will be placed in the hands of trustees—five from each State—and shall be sold within five years from July 1, 1914.

"3. The majority stock of the Merchants' & Miners' Transportation Company, now held by the New Haven Railroad, will be placed in the hands of three trustees and shall be sold within three years from July 1, 1914.

"4. The minority stock in the Eastern Steamship Corporation held by the New Haven Railroad shall be sold within three years from July 1, 1914, and in the meantime shall be deprived of voting power.

"5. Whether the New Haven Railroad shall be permitted to retain the Sound lines will be submitted to the Interstate Commerce Commission for determination under the provisions of the Panama Canal Act.

"6. That Berkshire trolleys shall be sold within five years from July 1, 1914.

"7. A decree embodying the foregoing shall be entered in the United States District Court for the Southern District of New York. The decree shall further provide that upon application of the New Haven Railroad for the trustees and for good cause shown, the time within which any of the above-mentioned stock shall be sold may be extended by the court.

"Trustees satisfactory to all parties have been suggested. Those proposed in connection with the Boston & Maine stock have signified their willingness to serve and their names are: Marcus P. Knowlton and James L. Doherty, of Springfield, Mass.; James L. Richards and Chas. P. Hall, of Boston, and Frank P. Carpenter, of Manchester, N. H. Names of the others will not be made public until acceptance by them is fully assured.

"The essential reason for placing the property in the hands of trustees is to secure their immediate independent managements. The outlines of the proposed decree and trust agreements have been discussed and are understood. Their verbiage remains to be worked out, but no difficulty is anticipated in that respect. This statement has the approval of both the attorney general and the representatives of the railroad."

In connection with New Haven developments, it is of interest to note that the Boston and Maine stockholders have approved the proposed sale of 159,601 shares of Maine Central at 95 on the terms of which the Boston and Maine is to receive $3,000,000 cash by May first, and the balance in five-year five per cent notes of Main Railway Company, which will provide cash by selling its stock, of that amount, to Maine

Central in exchange for the latter's thirty-day notes to be turned over to the Boston and Maine. The proposed trust agreement for holding of Maine Central majority stock provides that Messrs. Morris McDonald, Charles O. Bancroft and Harry M. Verrill, all of Portland, shall be trustees.

THE FLOOD RAVAGES OF THE MISSISSIPPI VALLEY

The people of the Mississippi Valley are contending more vigorously than ever before that Congress develop some effective means whereby the great losses which occur through the overflowing of its banks, by the Father of Waters, shall be stopped. Losses aggregating as high as $100,000,000 have been caused by these floods and as yet no adequate plans have been developed to check them. Organizations of business men from Pittsburgh to New Orleans, want the lands adjacent to this river and its tributaries protected, and it is the consensus of opinion that a big investment by the United States Government, even to the extent of $60,000,000 a year for ten years, would be justified, not only in the protection it would assure to the lands which are already under cultivation, but also on account of the possibilities of the reclamation of hundreds of thousands of other acres.

The waters from this vast system of rivers, as it converges and flows into the Gulf of Mexico, comes from and is distributed through thirty States and it has become apparent that the combined influence of these States is necessary to procure a liberal and definite action by Congress, which will fully meet the situation. The loss which occurs from year to year is enormous, and recent experiences indicate that the floods are increasing rather than decreasing from year to year. As to figures, it is stated that the direct losses by flood at Pittsburgh have amounted to more than $12,000,000 in the last ten years, while the flood losses along the Ohio Valley in one year have been calculated by the Inland Waterway Commission at over $100,000,000. The Pittsburgh Flood Commission after a comprehensive study of the situation by competent engineers, has come to the conclusion that for $20,000,000 Pittsburgh could build reservoirs and store up the source streams of the Ohio to be released in the dry seasons to the advantage of the navigation interests. This would not only prevent floods but would add to the transportation possibilities in this district.

The Drainage Area of the Mississippi and its tributaries is included within the heavy black line and covers nearly half the country. The deeply shaded area in the southern part of the Mississippi Valley is that subject to overflow in time of flood.

The plan taken up at the recent National Flood Prevention and River Regulation Conference in New Orleans affects the entire territory drained by the Mississippi and its tributaries.

"It may be a source of surprise to a great many of our people," said John M. Parker, who presided at the conference, "to know that the damage by floods in the Mississippi Valley has amounted to more, since the beginning of the building of levees, than the cost of all the wars engaged in and of all the pensions ever paid by the United States Government."

In the consideration of this problem it should not be overlooked that the disastrous floods of the last ten or twelve years have not been confined to the Gulf States for as in 1902, the chief damage was in Illinois, Missouri, Kentucky, Arkansas, Tennessee, Louisiana and Mississippi, while in 1912, the States most severely effected were West Virginia, Ohio and Indiana. It should also not be overlooked that while this enormous accumulation of water under present conditions constitutes a grave menace, it would, if properly controlled and conserved, prove of the greatest value not only in the regulation of its flow for navigation but for irrigating either arid lands or lands subject to drought, such, for example, as Kansas and other Middle Western States suffered from last summer and which resulted in extensive crop damage.

For the above reasons, the progress of the Newlands bill will be watched with interest as it represents the most comprehensive and progressive step yet taken to properly control the waters of the Mississippi and its tributaries.

The money appropriated by the Newlands bill is to be known as the River Regulation Fund, and is to be used to secure:

Promotion of interstate commerce by the development and improvement of the rivers and waterways of the United States and their connections with the Great Lakes and with each other by the following means:

The co-ordination of and co-operation between railroad and water routes and transportation and the establishment and maintenance of adequate terminal and transfer facilities and systems, and their maintenance, improvement, and protection.

The making of examinations and surveys and the construction of engineering and other works and projects for the regulation and control of the flow of rivers and their tributaries and source streams, and the standardization of such flow.

The maintenance of navigable stages of water at all seasons of the year in the waterways of the United States.

Preventing silt and sedimentary material from being carried into and deposited in waterways, channels, and harbors.

The conservation, development, and utilization of the water resources of the United States.

Flood prevention and protection, through the establishment, construction, and maintenance of natural and artificial reservoirs for water storage and control, and the protection of watersheds from denudation, erosion and surface waste, and from forest fires.

The maintenance and extension of woodland and other protective cover thereon.

The reclamation of swamp and overflow lands and arid lands.

The building of drainage and irrigation works in order that the flow of rivers shall be regulated and controlled, not only through the use of flood waters for irrigation on the upper tributaries, but also through controlling them in fixed and established channels in the lower valleys and plains.

Doing all things necessary to provide for any and all beneficial uses of water that will contribute to its conservation of storage in the ground or in surface reservoirs as an aid to the regulation or control of the flow of rivers.

Acquiring, holding, using, and transferring lands and other property that may be needed for the aforesaid purposes.

Doing such other things as may be specified or necessary to the accomplishment of the purposes of the bill.

Securing the co-operation of States, municipalities and other local agencies.

The bill creates a Waterways Commission, with the President of the United States as chairman, having veto power, and including the Secretaries of War, the Interior, Agriculture and Commerce, and the chairman of the Board of River Regulation, also created by the bill.

BOOK REVIEWS.

Railway Reorganization.— The eyes of the country are turned upon the railroads as never before. Railroad reorganization is no new phenomenon—it is old enough to have been very fully studied—but it has gained a new national significance. The fullest study of precedents of this sort is a volume called "Railroad Reorganization" by Stuart Daggett, Assistant Professor of Railway Economics in the University of California, published by the Harvard University Press as Vol. IV of the Harvard Economic Studies. It is an examination into the financial history of the largest six railroads which failed between 1893 and 1896, and a careful study of the Rock Island System which was reorganized in 1902. No less than forty-two reorganization plans are considered. The most important development in practice, the author finds, has been the increasing use of new securities bearing a fixed rate of interest with new securities bearing a conditional rate of interest; a use which may make the losses of security-holders merely temporary, and yet safeguard the interests of the corporation.

Contemporary Opinion

Starve the Railroads and We Starve Ourselves.

(Frank A. Munsey in "Munsey's Magazine" for April.)

FORCING railroad managements into a position where they have been compelled to squeeze paltry dividends out of half-fed, half-nourished properties that they might keep their roads out of bankruptcy, is a rotten policy.

Legitimate economies are fundamentally necessary to honest, able management, and whatever the government has accomplished in the way of cutting out waste and introducing first rate standards of economy is, of course, very much worth while. But to starve railroads into other economies, such, for instance, as skimping on roadbeds, skimping on bridges, skimping on rails, skimping on rolling stock, skimping on safety devices, and skimping all along the line, is quite another matter. They are costly savings to the people, dearly bought savings.

I hold no brief for the railroads; I am not speaking for myself, as I hold no railroad stocks, and don't wish to hold any under present conditions. Neither am I speaking for those who do hold railroad stocks. I am speaking for idle men, speaking in the interest of better business, speaking for a square deal for the railroads, for safe railroads, for sound railroads.

For the government to stand back of railway labor, morally sustaining it in its demands for shorter hours and better wages, as the government has done, at the same time denying railroads the right to increase their incomes sufficiently to meet the increased cost of operation, is of the nature of confiscation, and no honest citizen in this country believes in any such thing or would himself, with full realization of the facts, be a party to it.

Let us have peace. Let this bitterness against the railroads cease. There is nothing in all this warfare for you or for me. Give the railroads a chance to prosper and we prosper with them; starve them and we starve with them.

Government Ownership Ways.

THE New York Sun" prints the following letter from Roger W. Babson:

"How can the Government at Washington object to granting higher rates to our American railroads when it charges five cents a mile on its only road, the Panama Railroad?

"How can the Government at Washington have the face to ask American railroads to purchase steel cars until it buys at least one such car for its own road which it operates on this Isthmus?

"How can our Government at Washington complain about the service on American lines when it operates only four trains a day on its own line, which, moreover, has a monopoly of all business?

"How can our Government at Washington consistently object to monopoly when itself operates and insists upon the most exclusive railroad monopoly in America?

"Let our Government first show how it can operate its own road, where it has an absolute monopoly, on a two-cent fare or else furnish steel cars and a good service before dictating to others."

Chronic Delay in Rate-Making.

(Philadelphia "Bulletin.")

SOME weeks ago the Interstate Commerce Commission decided that free service on "tap-lines," or freight tracks constructed for the convenience of specific shippers, whether granted directly or in the form of an allowance or division of rate, constituted a virtual rebate and therefore was an improper discrimination against other shippers not so favored. The contention has been carried still farther and it has been urged that the railroads should make a charge for all "spotting," or shifting of cars to and from sidings.

But when the railroads of the Eastern group filed new tariffs following directly the line of the Commission's decision and assessing charges for service on all such industrial "tap-lines" without discrimination, the Commission—as a matter of "routine" according to the official announcement—suspended the new rates, except as applying to iron and steel companies, until July, with every prospect that a further suspension will be made until fall.

The failure of the Commission to approve action taken in line with its own decision is sufficient to provoke criticism. What is just and equitable as affecting the iron and steel industry should apply as well to other industries. But the striking suggestion is that a three months' suspension of the new tariffs is a matter of routine, the ordinary course which any important change in rates must take, and, while it is within the possibilities that the Commission may make a decision in a lesser time, actual experience has been that one suspension follows another and a readjustment of rates often is delayed for a year or until conditions which exist when the rates go into effect are entirely different from the situation when the tariff was designed.

The practice of the Commission has become one of chronic delay, and, although the blame should not be placed upon the members collectively or individually, it is none the less serious and fundamentally defective. Rate regulation for the entire railroad system of the country, together with the multitude of other responsibilities as to railroad operation resting upon the Commission, is an impossible task for any nine men. And unless there is a change in the national policy, and the duty of governmental supervision is simplified, rather than constantly increased and complicated, the whole scheme of governmental regulation must fall, by reason of its own weight.

The Key to Prosperity.

(From the Milwaukee "Sentinel.")

IT amounts to a truism to say that the adversity of the railroads is incompatible with the prosperity of the country.

The prosperity of the country and the prosperity of the railroads are interlocking propositions; and if the Government does not permit the railroads to earn enough revenue to meet their cost of living, including their heavy taxes and their high wage rate, the Government is simply putting a drag on the general business of the country—artificially promoting the general condition of slack times and unemployment.

Is our public fully aware of the fact that, while American railroads are compelled (justly, we hold) to pay by far the highest wage rate in the world, American freight rates are materially lower than freight rates in Europe?

Our Government has taken over the rate fixing power.

Unlike other lines of business, railroading is not permitted to fix the price of the commodity it has to sell—transportation.

The public is thus protected against excessive freight rates.

But what about the companies, their army of employes and thousands on thousands of small investors?

Have they no equity in this Government rate fixing arrangement?

Very emphatically they have.

The Interstate Commerce Commission is supposed to be a quasi-judicial body; a body constituted, not for railroad baiting purposes, but to hold the scales of justice even between the buyers and the sellers of railway transportation.

There will be no general business revival so long as these great and multifarious purchasers and employers of labor, the railroads, are held down to a rate that cramps them in every direction.

If there can be such a thing as "Democratic good times," they will dawn when the Government rate makers permit these great enterprises to meet their increased cost of living liberally, and not before.

There is every reason to believe that a decision favorable to the roads would mark the beginning of the end of the present comparative stagnation.

President Rea's Call to Action.

(From the "Chronicle" of March 14th.)

SELDOM does a President of the Pennsylvania Railroad address the shareholders assembled at an annual meeting. The forcible speech made by President Samuel Rea to the stockholders on Tuesday last, at the meeting in Philadelphia, was thus unusual, but it was induced by extraordinary circumstances. The Chairman of the Iowa State Railroad Commission had made an aspersion before the Interstate Commerce Commission upon the Pennsylvania management and its method of accounting. This spurred President Rea to make prompt and emphatic denial and to point out that a standing offer is before the Commission from the management to explain anything pertaining to the accounts and reports of the Pennsylvania Railroad whenever the Commission desires an explanation.

President Rea was goaded by other circumstances, also, to take a firm stand against further legislature encroachments on the rights of investors and to make a fight for a repeal of the obnoxious Full-Crew laws. He called attention to the fact that one-third of the ninety thousand shareholders of the Pennsylvania Railroad Company are citizens of the State of Pennsylvania. Simply because they are investors, they should not be deprived of rights granted to other citizens. It has become common for nearly all classes of citizens to petition for legislation which will be of particular benefit to the petitioners and to work to obtain the laws which they wish passed. President Rea exhorts all investors to exercise the same right, not only in their respective States but in Congress as well. He urges not only that they shall work to prevent the passage of obnoxious laws, but for the repeal of those which are burdensome and wasteful.

Apparently the time is ripe for a national movement among investors to organize for their own protection. They are entitled to just as much consideration as is any other class of citizens. They have long been complaining of oppression, but there has been no attempt at organization for the purpose of bringing about a remedy. Their watchful waiting has been construed to mean supine indifference. If there are 30,000 owners in Pennsylvania of the stock of one large system, how many more thousands there must be who are interested in all other stocks. The power of the investors, if united, would be overwhelming, and one which politicians could not afford to ignore. It is simply because there has been no organized effort to resist encroachment that the anti-railroad movement has reached such magnitude.

If the officers of other railroad companies will rally to the support of President Rea, and owners of stocks and bonds of all important corporations will join in an effort to guide legislation in the right channels, a great step will be taken to restore confidence. That constant agitation against the railroads has affected their credit adversely, is shown by the difficulty which railroads are now meeting in obtaining funds by the customary course of bond issues. Instead of making long-time loans at a moderate rate of interest, railroads are forced to borrow money for short terms at high rates and to give secured short-term notes. In addition, one important railroad was obliged to attach unusual conditions for the protection of the money-lenders which may operate to the disadvantage of the shareholders.

Calumny is a dangerous weapon. President Rea has done well to enter a vigorous protest. He should not be allowed to stand alone. There are millions of persons in this country in sympathy with him and who should rally to his support.

Immoral Action by the Government.

THE justifiable apprehensions of railway officers are based upon continued legislative action in violation of the fundamental rule that economic control and economic responsibility must be united. The progressive separation of these elements under laws taking from the owners of the properties more and more of the degree of control over rates and operating methods which ownership formerly implied, though these owners must still accept all losses resulting from insufficient rates, unwarranted increases in wages, or the employment of an excessive number of men, seems to be unwise from either the economic or the political point of view. The lack of public protest against the immoral actions of the Post Office Department, under which the railways have been forced for years to carry the mails at ruinously low rates, and, more recently, to take over the transportation of the parcel-post traffic, with compensation for only a beggarly fraction of its total, points to a disregard, when railways are concerned, of ordinary principles of fair dealing and common honesty that is not less than ominous.—L. F. Loree, president, Delaware & Hudson Co.

Political Attacks Upon Railroads Harmful to Country's Prosperity.

A. L. MOHLER, President of the Union Pacific Railroad, is of the opinion that the ill treatment of railroads at the hands of politicians is doing the Western section of the country a vast amount of harm. In a recent statement he says:

"The railroads have created the facilities which represent part of your prosperity, and are one of the developing influences in western civilization; their property, their men and their officers are entitled to the same fair treatment that you extend to other respectable citizens and businesses of the city, county and state.

"Why are there not more people in Nebraska, which is so sparsely settled? The platform has been occupied by our traducers for the last ten years, until they have succeeded in discouraging investment in enterprises of our character.

"The tremendous increase in taxes, with the regulations which are covered by numerous State and Federal laws, all of which carry expense, and the discrediting of the sincerity of men in our profession, has resulted in a lack of confidence in what should be, aside from Government bonds, one of the most acceptable investments in this country.

"So long as these conditions exist and we are continually attacked by irresponsible people—I mean men, usually, who have no investment to imperil except their personal position—it cannot result otherwise than to discourage development in the territory west of the Mississippi River. This territory could, under the right conditions, sustain 50,000 miles more of track at an investment of $2,000,000,000, adding to the value of the lands and the creation of taxes, and supporting many millions more people."

An Unsound Parallel.

("Wall Street Journal.")

WHEN the question of government ownership of railroads, in a country whose government is subject to the popular vote, crops up, we are invariably referred to the Panama Railroad as an instance of successful public ownership. If charging three cents per ton for freight carried by the privately owned railroads of the United States for one-fourth of that figure represents successful operation, there is nothing more to be said. Is that the kind of bill the shippers of this country and the consumers are willing to pay to secure the proffered boon?

But the administrative success in Panama was due to the exact reverse of popular government. It was, in fact, a military autocracy. Officers of the American Army, beyond the reach of bribes or politics, administered the road, unhampered by taxing boards, state regulating bodies, labor unions, or the Interstate Commerce Commission. If the carriage of freight under such favorable conditions was so costly on the fifty miles of switch at Panama, what would not politics do with the 250,000 miles of steam railroad here?

When the German State railroads, capitalized at twice the figure of the American roads, are quoted as an instance of successful State ownership, the same objection applies. Their administration is quasi-military and absolutely autocratic. There is nothing like popular control. All sorts of rebates and favors are conceded as matters of state policy, and the losses are made up by the general taxpayer, the consumer and the shipper small enough to be ignored.

No less than 216 local bodies in this country have tried municipal ownership of electric railways and relinquished it. Texas has a State railway on its hands, which it would like to give away to a private corporation on any terms that would save its face. The plain fact is that only privately owned roads, run with the most rigid economy and the highest efficiency possible by a corporation, can in any measure meet the ever increasing public demands and live.

It is said that the $35,000,000 government railroad in Alaska is to be an object lesson in successful government ownership. Even if it is run without rebates, passes or political favoritism, at the present freight and passenger rates permitted by the Interstate Commerce Commission, it will provide a bottomless quagmire for the taxpayer's money, worthy to rank with the rivers and harbors pork barrel.

The Outlook for the Express Companies.

(From the "New York Times Annalist" of March 16th.)

FROM the decision of the United States Express Company to liquidate and retire from the field it may be inferred that there is no business left for the express companies to do with profit to themselves and that, therefore, in a little while, the parcel post will entirely supplant them. That is not the case. There is an increasing demand, especially in the areas where population is dense, for the rapid transportation of freight in less than carload quantities. The railroads are performing that service at a loss. The loss is owing partly to the fact that they are not properly equipped for the business and largely to the fact that they do not control the collection of the freight. Thus, you see to-day small quantities of freight moving in forty-ton railroad cars at a loss, and in express company cars, on passenger trains, at a profit. If the express companies will take this field they will be able to relieve the railroads of a lot of unprofitable business, and at the same time so to control the collection of the tonnage as to eliminate the waste of moving it in haphazard quantities. Instead of small freight parcels reaching a certain point both via freight and express cars, they would go either one way or the other. It is a field which the railroads could occupy for themselves, but which the express companies could more easily command. They have the facilities for collecting and carting the goods; the railroads have only the facilities for moving it after it has been delivered to their platforms. The express companies should become freight forwarders, taking the whole contract, to pick up freight at the shipper's outgoing door, and to deliver it anywhere in the world.

The Danger to the Express Companies.

(New York Tribune.)

THE stronger express companies still remaining the field can probably survive if the conditions under which they operate are made no less favorable than they are to-day. Their chief danger is in the uneconomic character of the competition which they face. They have to earn dividends. The Parcels Post can be operated indefinitely with a deficit. It can be operated with a deficit and call the deficit a surplus. There is a nominal surplus now, though upon a fair basis of payment for the services rendered by the railroads in carrying parcels for the postoffice there would be a deficit. The Government can always juggle charges about so as to create the appearance of a profit. It can make the freight rate payer pay for the carrying of parcels in the Parcels Post, as it now makes the senders of one class of mail pay a large part of the expenses of another class of mail.

In order that the express companies should have a fair chance, the Parcels Post should be operated upon a business basis. It should pay for the service it requires of the railroads, not make the freight rate payers pay for them. It should have an honest system of bookkeeping that will disclose the truth. The Government requires this of public service corporations; it should set them an example. It would be a pity if by the loose accounting methods which it scolds in others it should force to the wall, performers of a public service as necessary as the express companies are.

The Express Companies.

(New York Times.)

THE way of Congress with the relation of the parcel post to the express companies is too thorough for The Merchants' Association of this city. It wanted the express business reformed, not ruined. Now that there is talk of the liquidation of the express companies, the Association recalls how excellent was the service they rendered, and how inferior, comparatively, is the commercial service of the parcel post. The express companies collect their business, give receipts for what they collect, pay indemnity for losses, with special security against them, prevent damage in transit—whereas the Post Office does damage in examination of parcels—and do business through a wider range of classes. These are not only the affirmative excellences of the express companies, they also are the defects of the parcel post. To the extent that one of the two services cripples the other, and to the extent that the express companies retire from the unequal competition, the field is abandoned altogether, for the law disqualifies the postal parcel service from doing what the express companies do. It is the formal opinion of the Association that the postal parcel service cannot be extended so as to be a satisfactory substitute for the express companies.

Congress and the Interstate Commerce Commission are racing each other in the authorization of destructive and unfair rates to please the people, and the people are not pleased with the results after all. Those who get anything for less than its cost and worth always want more, and never can be satisfied with anything short of all there is. It is so with the I. W. W., and, it would seem, with the people themselves. They are willing to accept the postal service, although it is established over the prostrate forms of the express companies, and supplied on Robin Hood principles. The Post Office requisitions the services of the railways in the manner of Villa, although amid profound peace. The Post Office submits to the protest of its own staff that it is overworked and underpaid. And then Representative Lewis in his place in the Capitol says this unpaid-for accommodation to the people "has turned a deficit in the postal revenues of $7,000,000 to an $8,000,000 or $10,000,000 surplus in the first year of its operation." The first year is not yet over, and the bills have not yet been presented or paid.

The Panama Canal as an Aid to Râilroads.

THE "World's Work" for April contains an interesting article by Theodore P. Shonts, President of the Interborough Metropolitan Street Railway of New York, in which is discussed the opening of the Panama Canal with reference to its effect on the economies of the United States and the trade relations of this Nation with other countries. As Chairman of the Second Isthmian Canal Commission, Mr. Shonts acquired intimate knowledge of affairs pertaining to this great waterway and an interesting feature of his article, in view of the present status of the Canal tolls bill, has to do with the effect of the opening of the Canal on the traffic of the trans-continental railroads. We quote in part as follows:

"I do not hold what seems to be the popular view, that the opening of the Canal will have a serious effect upon the business of the transcontinental railroads of the United States; on the contrary, I am inclined to believe that it will be to their advantage so soon as trade conditions adjust themselves.

"The traffic of the transcontinental railroads that will be the most seriously affected is that which originates at Atlantic Coast points, destined to ports on the Pacific, and vice versa. With this traffic the steamers that operate by way of the canal will come into direct competition; and, as their rates will be lower and the time taken in transit approximately the same as is now taken by the railroads, diversion of business is naturally to be expected.

"The railroads may lose some of their cheaper tonnage, but this will be more than made up to them by the inevitable increase in higher class traffic that will be brought about by the development of the territory they serve."

Reference to the canal tolls bill and a coastwise merchant marine is made by Mr. Shonts as follows:

"The opening of the canal will undoubtedly stimulate the building of American steamers for the carriage of cargo between ports on the Atlantic and Pacific coasts of the United States, even if the free tolls clause in the canal act is suspended, since steamers of foreign registry will not be permitted to engage in this traffic."

Personal

Carl R. Gray.

CARL R. GRAY, who on March 10th, resigned from the presidency of the Great Northern Railway to become president of the Western Maryland Railway, was born September 28, 1867. He was educated at the Arkansas Industrial University and entered railway service in 1882, as telegraph operator for the St. Louis and San Francisco Railroad. Since that time he has been consecutively employed in the following manner—1882 to 1886, telegraph operator and agent; 1886 to 1887, clerk in the traffic department; 1887 to 1890, commercial agent; 1890 to 1897, division freight agent; 1897 to 1900, division superintendent; 1900 to 1904, superintendent of transportation; April 8, 1904 to November 4, 1904, general manager; 1904 to 1906, second vice-president and general manager; 1906 to 1909, second vice-president; 1909 to 1911, senior vice-president, all with the St. Louis and San Francisco Railroad. On May 1, 1911, Mr. Gray became president of the Spokane, Portland and Seattle Railway, and on May 15, 1912, was elected president of the Great Northern Railway.

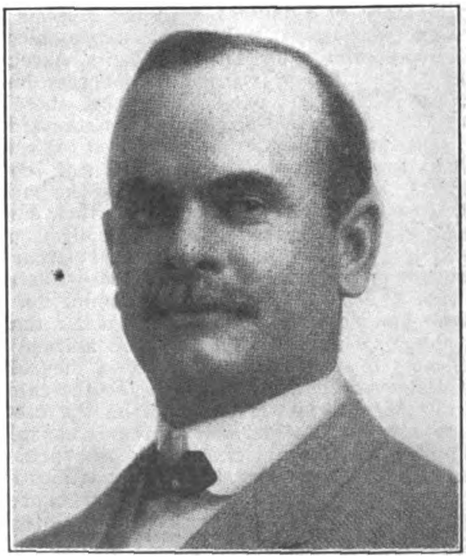
W. A. Garrett.

W. A. GARRETT, until recently vice-president of the Chicago Great Western, has been appointed chief executive officer for the receivers of the Pere Marquette, with headquarters at Detroit, Michigan.

Mr. Garrett was born at Canton, Miss., in 1861 and began railway work in 1876 as a messenger in the ticket office of the Ohio and Mississippi Railway. Subsequently he entered the employ of the St. Louis Union Depot Company, with whom he held various positions including that of office messenger clerk in the car department, time keeper, assistant paymaster, purchasing agent, conductor, yardmaster, secretary and assistant superintendent.

From 1893 until 1896, he was superintendent of the Terminal Railroad Association of St. Louis and also terminal superintendent of the Wabash Railroad, and in 1894 his authority was further extended to the superintendency of the St. Louis Merchants' Bridge Terminal Railway. On January 1, 1896, he became superintendent of the Western Division of the Wabash, being transferred in April of the following year to the middle division of the same road. August, 1899, found him superintendent of the Philadelphia Division of the Philadelphia and Reading, which position he held until September, 1900, when he was transferred to the New York Division. In March, 1902, he became general superintendent of the Philadelphia and Reading. In May, 1903, he accepted the position of General Manager of the Cincinnati, New Orleans and Texas Pacific and the Alabama Great Southern, where he remained until November, 1906, when he became vice-president of the Seaboard Air Line. The following year he was elected president of that road, which position he held until October, 1909, when he left the railway service to become vice-president of the T. H. Symington Company. From October 1, 1911 to September 18, 1912, he was chairman of the General Managers' Association of Chicago and the Association of Western Railways, leaving this position to become vice-president of the Chicago Great Western.

Mr. Garrett's career has been a remarkable one, even among railway officials, and has splendidly qualified him to handle the heavy responsibilities of his new position. He recognizes fully the necessity of conciliating public opinion, and it can be confidently predicted, that under his management, the patrons of his road will be given an absolutely square deal. In the rehabilitation of the Pere Marquette, Mr. Garrett has probably confronting him the most difficult problem of his career. His record fully justifies the prediction, however, that he will successfully meet it, and that the Pere Marquette has found an executive officer who will prove no small factor in the development of its full possibilities.



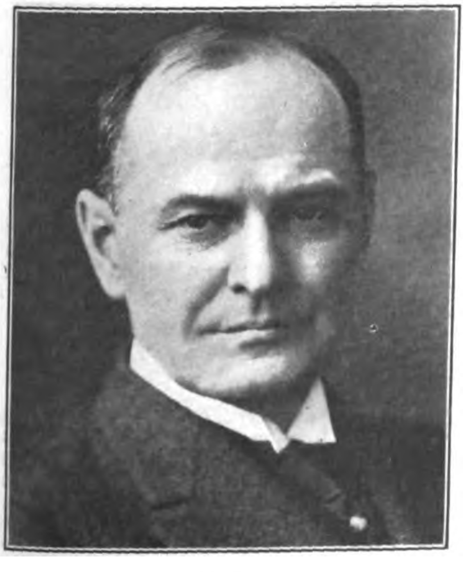
W. A. GARRETT.

J. M. Kurn.

J. M. KURN, who has been elected president and general manager of the Detroit, Toledo and Ironton Railroad Company, with office at Detroit, was born in 1870 in Mount Clemens, Michigan. He entered railway service in 1885, with the Michigan Central as telegraph operator, since which he has been consecutively, November 10, 1887 to 1892, with the Santa Fe as an operator and agent; 1892 to 1902, dispatcher, Pueblo, Colo.; 1902 to 1903, chief dispatcher; 1903 to June 27, 1905, trainmaster, June 27, to August 20, 1905, trainmaster, Las Vegas, N. M.; August 20, to December 30, 1905, superintendent of the Rio Grande Division, San Marcial, N. M.; January 1, 1906, to October 1, 1910, superintendent of New Mexico Division, with office in Las Vegas, N. M. On October 1, 1910 general superintendent, Northern District, Western Lines.

E. H. Lee.

E. H. LEE, who has recently been appointed vice-president of the Chicago and Western Indiana, retaining, at the same time, the position of chief engineer, was born in Dayton, Ohio, and was educated at the Ohio University and the University of Wooster. In the first few years of his railway service, he was largely engaged as rodman with the assistant engineers of various railroads including the Baltimore and Ohio, the Norfolk and Western, the New York, Chicago and St. Louis, the Union Pacific and the Wisconsin Central. From 1890 to 1893, he was chief engineer of the Elgin, Joliet and Eastern Railway and from 1893 to 1898, was engaged in private engineering practice and worked as a contractor. Since the latter year, he has been chief engineer of the Chicago and Western Indiana Railway Company and the Belt Railway Company of Chicago, which positions he held at the time of his recent appointment. Mr. Lee is a member of the American Society of Civil Engineers, the American Railway Engineering Association and is at the present time president of the Western Society of Engineers.



E. H. LEE.

Henry W. Thornton.

Henry W. Thornton.

HENRY W. THORNTON, whose recent appointment from the Long Island Railroad to the general managership of the Great Eastern Railway of England, has caused widespread comment in the press, was born in Logansport, Ind., in 1871. He began his railway career with the Pennsylvania Lines West of Pittsburgh in 1894, as draughtsman in the office of the chief engineer and held various positions in that office and in the construction department until 1897, when he was appointed supervisor at Columbus, Ohio. In the latter part of that year, he became assistant engineer of the Cincinnati Division and in 1899 was assigned to special work under the general manager. In November, of the same year, he was promoted to the position of engineer of maintenance of way of the Erie and Ashtabula Divisions and in 1901, became superintendent of the Marietta Division, going from there in 1902, to the position of superintendent of the Cleveland, Akron and Columbus Road, returning, however, to the Erie and Ashtabula Division a few months later as superintendent. On February 1, 1911, he was appointed assistant general superintendent of the Long Island and the following November became general superintendent.

J. M. Davis.

J. M. DAVIS has been appointed general manager of the Baltimore and Ohio Southwestern-Cincinnati, Hamilton and Dayton lines, with headquarters at Cincinnati, succeeding W. C. Loree, who resigned. The appointment which is announced by vice-president A. W. Thompson, the head of the operating department, is effective at once. Mr. Davis has been assistant general manager since January 1st.

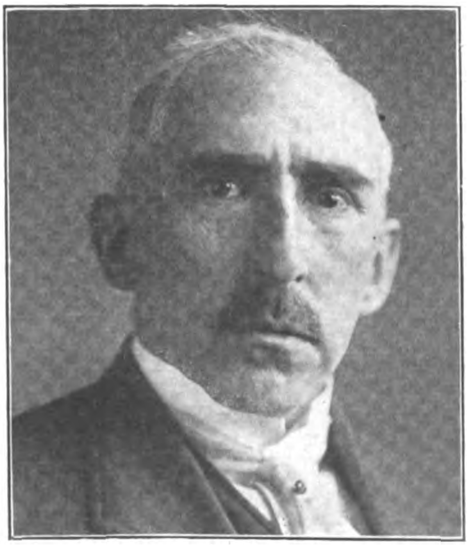
The new general manager of the Southwestern District of the Baltimore and Ohio began his railroad career in the Southwest and was later employed by the Great Northern, Erie, Union Pacific, and Southern Pacific Lines. Prior to entering Baltimore and Ohio service, the first of the year, he was general superintendent of the Southern Pacific Railroad at San Francisco.

J. M. Davis.

Jenks B. Jenkins.

JENKS B. JENKINS, who has been appointed valuation engineer of the Baltimore and Ohio System, has been advanced from the position of assistant engineer, with headquarters at Baltimore.

Mr. Jenkins has had wide experience in railroad and municipal engineering. He was born January 28, 1869, and was graduated from the Western University of Pennsylvania in June, 1888, after a four years' course. In 1887 he was engaged in railroad location work with an engineering firm and in May, 1888, became an assistant in the office of the City Engineer of Allegheny, Pa. Mr. Jenkins was employed as a structural steel draftsman in 1893, and in January, 1894, became a topographer for the Baltimore and Washington Traction and Tramway Company, an electric line. Later he was in charge of location of the Washington and Great Falls Electric Railway. Returning to Pittsburgh, he engaged in the private practice of engineering. From March, 1896, to December, 1897, he was a topographical draftsman in the department of street improvements of New York City. In June, 1898, he became assistant engineer of the board of public improvements of New York, in charge of street openings in the Borough of Queens.



Jenks B. Jenkins.

Mr. Jenkins became assistant engineer of the Baltimore and Ohio Railroad, May 1, 1900, having previously been in the maintenance of way and real estate departments of the company, and as an engineer on the Staten Island Rapid Transit Railroad, a New York terminal line of the Baltimore and Ohio.

John J. Koch.

JOHN J. KOCH, who on February 16th, was promoted to the position of assistant freight traffic manager of the Pennsylvania Lines West of Pittsburgh, was born in Pittsburgh in 1861. He entered the service of the Pennsylvania Company in the office of the general freight agent in 1879, and in 1881, was made clerk in the division freight agent's office. In 1884, he was appointed chief clerk in that office and in 1897 was promoted to division freight agent. Mr. Koch was appointed general freight agent of the Pennsylvania Company in 1908, which position he held at the time of his recent appointment.

John J. Koch.

G. S. McCabe.

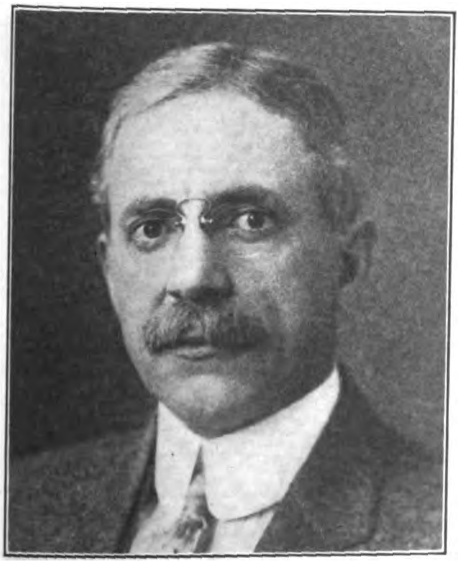
G. S. McCABE, who became general freight agent of the Pennsylvania Company, with headquarters at Pittsburgh, on February 16, 1914, was born at Sewickley, Penna., in 1873. He entered the service of the company as messenger in the general office of the Pittsburgh, Cincinnati, Chicago and St. Louis Railway Company at Columbus, Ohio, in 1889, and in 1894, was made clerk in the office of the di-

G. S. McCabe.

vision freight agent's office at Richmond, Ind. In 1896 he was appointed traveling freight agent with headquarters at Richmond, and in November of the same year, was promoted to be division freight agent at that city. In 1908, he became general western and division freight agent at Chicago and in 1910, was made general western and division freight agent of the Pennsylvania Company at the same city, which position he held at the time of his recent promotion.

S. C. Matthews.

S. C. MATTHEWS, who has recently been promoted to the position of assistant general freight agent of the Pennsylvania Company, with headquarters at Pittsburgh, was born at Cincinnati, Ohio, in 1868. He began work for the Pittsburgh, Cincinnati, Chicago and St. Louis Railway in 1882 as clerk. In 1885, he became voucher clerk in the division freight agent's office at Cincinnati, and in 1887 was promoted to the chief clerkship in the same office. In 1905, he was made division freight agent and held this position until his recent appointment.



S. C. Matthews.

James E. Weller.

JAMES E. WELLER, who has recently been promoted to the position of general western freight agent of the Pennsylvania Lines, with headquarters at Chicago, was born at North Liberty, Pa., in 1868. He was employed by the railroad in 1890 as rate clerk in the office of the division freight agent of the Pittsburgh, Cincinnati, Chicago and St. Louis Railroad at Pittsburgh. In 1891, he was made contracting agent of the Vandalia Railroad and in 1897, was appointed commercial agent. In 1906, he became district freight solicitor of the Pennsylvania Lines and the Vandalia Railroad and two years later was promoted to division freight agent of the Pan Handle, with headquarters at Pittsburgh. On June 1, 1910, he became general western and division freight agent of the Pan Handle with headquarters at Chicago, which position he held until his recent promotion.

James E. Weller.

W. P. Hinton.

W. P. HINTON, who has recently been appointed assistant passenger traffic manager of the Grand Trunk Pacific Railway and the Grand Trunk Pacific Coast Steamship Company, Limited, with headquarters at Winnipeg, Man., was born in Hintonburg, Ont., now part of the capital city of Ottawa, in 1871; educated in Ottawa and entered the service of the Canada Atlantic Railway Audit Department in that city in 1887. In 1891, entered the traffic department as rate clerk and in 1898 was ap-

W. P. HINTON.

pointed assistant general freight agent. Appointed general freight agent in 1901 of the Canada Atlantic and the Canada Atlantic Transit Company and in 1903, general freight and passenger agent. When the Canada Atlantic was taken over by the Grand Trunk in October, 1905, became general agent, passenger department, of the latter company in Ottawa in charge of immigration and trans-Atlantic steamship business. In January, 1907, was appointed assistant general passenger agent, Montreal, and in May, 1909, became the first general passenger agent of the Grand Trunk Pacific Railway, to which was added in 1910 the Grand Trunk Pacific Coast Steamship Company, Limited.

W. H. Abel.

W. H. ABEL, who became assistant passenger traffic manager of the Chicago & Alton Railroad at St. Louis, Mo., effective March 1st, claims Elizabethtown, Pa., as his birthplace. He entered the service of the passenger department of the Chicago & Alton Railroad, January 1, 1887, at Denver, Colo., and has occupied continuously since that time various positions as city passenger agent in Denver, traveling passenger agent in California, district passenger agent in the Southwest, division passenger agent at Springfield, Ill., and assistant general passenger agent at Kansas City, Mo. He has complete knowledge of the detail of passenger business and in his new position will have general supervision over all passenger traffic matters in the territory south of the Ohio River and west of the Mississippi River to the Pacific Coast.

Garnett King.

GARNETT KING, who recently was appointed general passenger agent of the El Paso and Southwestern System, with headquarters at El Paso, Texas, began his railroad career in 1900 with the Arizona and New Mexico in the capacity of bookkeeper and pay master. In 1903, he was appointed traveling freight and passenger agent of the El Paso and Southwestern and in 1907 became general agent for this road and for the Rock Island Lines with headquarters at El Paso. In 1909, he was promoted to the position of assistant general freight and passenger agent of the El Paso and Southwestern System and in 1913, was transferred to St. Louis as general agent of both freight and passenger department, which position he held at the time of his recent appointment.

T. W. Heintzelman.

T. W. HEINTZELMAN, who on February first, was promoted to the position of general superintendent of motive power of the Southern Pacific Railway Company, began his railroad service as fireman after having served as machinist's apprentice in the draughting room and as foreman in a machine shop. He later became a locomotive engineer and was subsequently made general foreman and assistant master mechanic on the Chicago, St. Paul, Minneapolis and Omaha. From this position he went to the Chicago, St. Paul and Kansas City as master mechanic, with which road he remained until 1888, when he took service with the Southern Pacific Company in a similar capacity. In 1902, he was promoted to the position of superintendent of motive power of the Northern District of this Company, which position he occupied until his recent promotion.

T. W. HEINTZELMAN.

S. F. Clark.

SAMUEL F. CLARK commenced his railroad career April 20, 1896, in the general stores of the Great Northern Railway Company at St. Paul, Minn., and for fourteen years was Division and District Storekeeper at various points on the Great Northern Line.

November 1, 1909, he resigned from the Great Northern Railway Company as storekeeper at Hillyard, Wash. store, which is the Western

S. F. Clark.

District storehouse for the Great Northern Railway Company, and immediately assumed charge of the general storehouse of the Spokane, Portland and Seattle Railway Company, at Vancouver, Washington, remaining there until August 1, 1911, when he was transferred to the Disbursements Bureau of the Accounting Department of the Spokane, Portland & Seattle Railway Company at Portland, Oregon, remaining in this capacity until February 1, 1914, at which time he was appointed general purchasing agent of the Hill Lines in this territory.

W. W. Slater.

AFTER over half a century's service as a railroad man, W. W. Slater, dean of signal engineers, has retired from the service of the Southern Pacific Company on a pension. It was Slater who invented the principle of the automatic block signal and his personality was a contributing factor in the Southern Pacific's pioneer work of protecting its lines with the automatic block.

He was born in January, 1849, and began his railroad service in 1862, as a newsboy on Columbus, Pequa and Indiana Railroad. From 1864 to 1868, he worked as telegraph operator on various eastern railroads and in 1868 he went to Salt Lake by stage to engage in the same work. In 1869, he opened the first telegraph office in Ogden. This was used exclusively for the business of the Southern Pacific and Union Pacific. Three months after opening this office, Slater saw the first Union Pacific train arrive. It was greeted by a large number of people, many of whom had never seen a railroad or an engine. The end of the Central Pacific track at this time was near Montello.

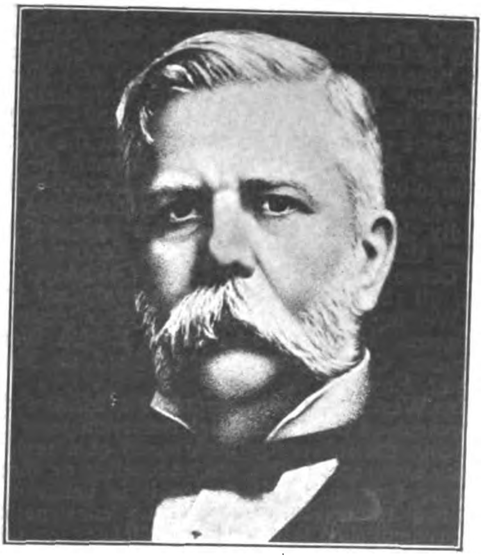
In 1869 he became freight operator on the San Francisco and San Jose Railroad. In June of that year he was made material clerk and operator at Warm Springs, securing track material for building the road from a point near Niles to the San Joaquin bridge, where it connected with the line being built from Sacramenta, and also from a point near Niles, to a connection with the Cohen Road at Hayward. This was completed in October, 1869, and the first through overland passenger train was run to Alameda to make boat connection for San Francisco in 1869. In 1865, he became signal engineer of the company.

Obituary

George Westinghouse.

GEORGE WESTINGHOUSE, the famous inventor and engineer, died at his New York City residence on March 12, 1914. The mental alertness and wonderful vitality that had so characterized his brilliant career, remained with him to the end. He was until the last, actively associated with a large number of industries, but during the last few years, he had begun a process of transferring his responsibilities to the shoulders of his trusted lieutenants and his demise therefore, will not cause any material change in the policy of operation of the companies so indelibly linked with the name of Westinghouse.

Mr. Westinghouse was born at Central Bridge, Schoharie County, New York, in 1846. He is of German descent and his father, who was an inventor, removed his family to Schenectady, New York, where he established the Schenectady Agricultural Works. The boy attended the public and high schools of the town and spent much of his leisure time in his father's machine shop. Before he was fifteen, he invented and made a rotary engine and at an early age, passed an



George Westinghouse.

examination for the position of assistant engineer in the United States Army.

In June, 1863, at the age of seventeen, he enlisted in the Twelfth New York National Guard and in November of the same year, was honorably discharged. He then joined the Sixtieth New York Cavalry as Corporal and was again honorably discharged in November of the following year. A month later, he accepted an appointment as third assistant engineer in the United States Navy. At the close of the war, Mr. Westinghouse tendered his resignation and was honorably discharged.

He returned to his home town and entered Union College where he remained until the close of his Sophomore year.

His first railroad invention occurred in 1865, when he developed a device for replacing railroad cars upon the track. His first idea of an automatic brake took the form of an attachment to the couplers, which was unsuccessful. He then experimented with steam, but this also proved unsatisfactory. At this point his attention was called, through a magazine article, to the employment of compressed air for certain purposes and this gave him the idea, which later developed into the famous Westinghouse air brake, used throughout the United States and in many sections of this civilized world. The first air brake patent was issued in April, 1869, and the Westinghouse Air Brake Company was formed on the 20th of July following. Manufacturing works were begun in 1869 and completed in 1870. From 1871 to 1882, Mr. Westinghouse was abroad introducing the air brake in England and other foreign countries, and making it applicable to the various conditions to be met there.

In the meantime, he invented the "automatic" feature of the brake which overcame the imperfections in the first form and removed the danger from the parting of trains on steep grades. In 1886, he invented the "quick action" brake, the improvement being made in what is known as the "triple-valve." By this valve, it became practicable to apply all brakes on a train of fifty freight cars in two seconds. Mr. Westinghouse also turned his inventive genius in the direction of signal work and it was he who developed and patented the system now manufactured by the Union Switch and Signal Company. The "pneumatic interlocking switch and signal apparatus" has been successfully introduced in Boston, Jersey City, Philadelphia, Chicago, St. Louis and many other places. In 1886, the Westinghouse Electric Company was formed for the manufacture of electric lamps and electric lighting apparatus, and the business developed so rapidly that in 1889 and 1890 this company absorbed the United States Electric Company and the Consolidated Electric Light Company. In 1891, all these properties were reorganized into the Westinghouse Electric and Manufacturing Company. In 1895, works of the British Westinghouse Company were established at Manchester, England.

Mr. Westinghouse is responsible for the development of the mechanical reduction gear for reducing the inherently high speed of a turbine to the slow speed of a ship propeller or direct current dynamo. This device it is believed is destined to revolutionize marine construction. He accomplished this work in collaboration with the late Admiral George W. Melville, U. S. N., and John H. McAlpine. Within recent years he has also occupied himself with the development of an air spring for automobiles and motor trucks. The alternating current transmission which is so widely used to-day to carry power from distant waterfalls and central stations for lighting purposes, is the result of Mr. Westinghouse's steadfast belief that this class of high tension transmission would make distant electrical distribution possible. In spite of opposition, ridicule and unfair efforts, the value of his methods have received world-wide recognition, and constitute a glowing tribute to his foresight and perseverance.

The same opposition was apparent in the more recent developments of his company with reference to alternating current traction by means of the single phase motor, which has now been wrought into an accomplished reality in the case of a number of traction lines, railroad terminals and tunnels.

Originating with one of the most important inventions connected with railways, the growth of the various Westinghouse industries has been largely identified with railway progress, and it is interesting to note that this progress has represented increased security of life, increased capacity of the railway and reduced cost of operation. It is simply stating a simple fact to say that Mr. Westinghouse has been a great factor in the advance of civilization as represented by the important part he has played by introducing improved means of transportation.

Chance has had no place in the success of this man. It has been due to his foresight, courage and technical skill. As with his first invention, the air brake, the different kinds of apparatus has been developed to answer actual needs, in some cases acknowledged generally, and in others foreseen by him with remarkable prevision. When the apparatus had passed the experimental state and was ready for commercial exploitation, he established factories which are themselves models, and which show the same anticipation of future development. Not only are the buildings handsome and well equipped with the best tools, but the comfort of the employes has been considered in every respect. It is worth noting that the nine-hour day, or rather the fifty-four hour week, was started in the Air Brake Works in 1869, and has been adopted in all the other works as they have been established.

Owing to his many achievements in mechanics, electricity, steam and gas, his name was known the world over, and he had many honorable distinctions conferred upon him for his achievements and in recognition of the services he rendered the various branches of engineering. His alma mater, Union College of Schenectady, conferred upon him the degree of doctor of philosophy. He was decorated with the order of the Legion of Honor, with the order of the Royal Crown of Italy, with the order of Leopold of Belgium. He was the second recipient of the John Fritz medal. He received the degree of doctor of engineering from the Koenigliche Technische Hochschule of Berlin, Germany. He was an honorary member of the American Society of Mechanical Engineers, of which body he was also president in 1910.

He was one of the two honorary members of the American Society for the Advancement of Science. He was an honorary member of the National Electric Light Association of America.

He was awarded the Scott premium and medal by the Franklin Institute of the State of Pennsylvania. He received the Edison gold medal for meritorious achievements in the alternating current system of electrical distribution. He received the Grashof gold medal from the Society of German Engineers in Germany, which acknowledged him the greatest American engineer.

Mr. Westinghouse was connected with a large number of industries at home and abroad, many of which bore his name. He was president and director of Westinghouse Air Brake Co., Westinghouse Machine Co., Nernst Lamp Company, The Union Swith & Signal Co., Societe Anonyme Westinghouse, Paris; Cooper Hewitt Electric Co., Pittsburgh Meter Co., Societe Italiene Westinghouse, Italy; The East Pittsburgh Improvement Co., The Westinghouse Brake Co., Ltd., London, Westinghouse Cooper Hewitt Company, London, Westinghouse Friction Draft Gear Co., Westinghouse Metal Filament Lamp Co., Ltd., London.

He was also chairman of the Board of Directors of Westinghouse Electric Co., Ltd., London, and Director, Westinghouse Elec. & Mfg. Co., The Traction & Power Securities Co., Westinghouse Metallfaden Gluhlampenfabrik, Vienna.

The Westinghouse Companies employ 50,000 men, on whom 150,000 persons are dependent. The total capitalization of all the companies is $200,000,000.

Mr. Westinghouse was married August 8, 1867 at Brooklyn, N. Y., to Marguerite Franklin Walker. They had one son, George, who is a graduate of Yale, and was recently married to the Honorable Evelyn Violet Brocklebank. His wife and son survive him.

A. B. Adams, division master mechanic of the Gulf, Colorado & Santa Fe Railway, at Silsbee, Texas, died suddenly February 16th, aged 49 years.

John Y. Boyd, a former member of the Pennsylvania State Railroad Commission, died at his home in Harrisburg, March 9th, at the age of 52.

Col. R. G. Butler, former general agent of the Grand Trunk Railway, at Milwaukee, Wis., died in that city March 18th, aged seventy years.

Adolph Butze, formerly general purchasing agent of the Grand Trunk, died at St. Louis, Mo., on March 3rd, aged 68 years. Mr. Butze began railway work in 1868 with the Wabash, in whose employ he remained for some time. From 1885 to 1887 he was in the purchasing department of the Missouri Pacific, and then became private secretary to the general manager of the Chicago, Indianapolis & Louisville. He was made general purchasing agent of the Grand Trunk in 1896, retiring on January 1, 1912, under the pension rules of the company.

Douglas T. Chase, formerly general superintendent of the Atchison, Topeka & Santa Fe Railway, died at Macon, Ill., February 20th, aged 78 years.

Thomas M. Connors, superintendent of the Hocking Valley, at Columbus, Ohio, died at a hotel in Toledo on March 17th. He was born on July 15, 1862, at Toronto, Ont., and was educated in Erie County, Pennsylvania, schools. In 1878 he began railway work as a telegraph operator on the Philadelphia & Erie, now a part of the Pennsylvania Railroad. He was then consecutively telegraph operator of the Standard Oil Company, the Cincinnati, Hamilton & Dayton Railroad and the Cleveland, Cincinnati, Chicago & St. Louis. From 1890 to 1891 he was train dispatcher on the Cincinnati, Hamilton & Dayton, and then to 1903 was trainmaster on the Kanawha & Michigan. He was subsequently trainmaster on the Toledo & Ohio Central and the Hocking Valley. From 1906 to 1907 he was assistant superintendent of the Toledo & Ohio Central and then was superintendent of the Kanawha & Michigan until 1909, when he was appointed superintendent of the Hocking Valley.

D. Clem Deaver, immigration agent of the Chicago, Burlington & Quincy Railroad, with office at Omaha, Neb., died in that city, February 23rd.

D. E. Fitzgerald, former assistant superintendent of motive power of St. Louis & San Francisco Railroad, lost his life in the fire which destroyed Missouri Athletic Club in St. Louis, March 9th. Mr. Fitzgerald resigned his position with the railroad in February last, to take a position with the Pierce Oil Corporation.

Edward Bourne Gibbs, formerly connected with the Union Pacific at North Platte, Neb., died on March 5th at St. Louis, Mo., aged 80 years. Mr. Gibbs was manager of power and rolling stock of the old Platte County Railroad in 1863, was master of machinery and motive power of the St. Louis & Iron Mountain in 1868, and in 1880 became connected with the Union Pacific at North Platte, Neb. Later he was in charge of the Oregon Division of that road at Portland, Ore., and subsequently returned to North Platte, retiring from active service in 1904.

John Grant, of 5886 Ellsworth Avenue, died in his home yesterday. Mr. Grant was born in County Down, Ireland. He was employed as a freight agent at the Anderson Street Station of the Pennsylvania Railroad Company, and had been in the employ of the company for the last 46 years. He was a member of the Sacred Heart Catholic Church and was secretary of the Church Committee and secretary of the Holy Name Society of the church. He was a member of Duquesne Council No. 264, Knights of Columbus, and Branch 34, C. M. B. A. His widow, three children, John A Grant, of Emsworth; Mrs. Minnie E. Denny, of Homewood; and Miss Loretta F. Grant, at home; two brothers, James Grant, of Wilkinsburg and Patrick Grant, of County Down, Ireland, and one sister, Elizabeth Grant, in Ireland, survive.

Frank N. Hall, superintendent and general freight and passenger agent of the Moncton & Buctouche Railway, aged 48 years, met death in a railway accident near Moncton, N. B., February 20th.

W. L. Hall, general attorney of the Texas & Pacific, with headquarters at Dallas, Texas, died recently at the age of 67.

J. J. Harding, formerly engineer of masonry construction on the Chicago, Milwaukee & St. Paul, at Chicago, died at Seattle, Wash., on February 28th. He had been in the service of the St. Paul from 1895 to 1910.

J. W. Jacomb-Hood, M. I. C. E., of London, England, chief resident engineer of the London & Southwestern, died suddenly March 6th, while riding horseback, alone, the cause of death being, presumably, heart disease. Mr. Jacomb-Hood was known to many Americans. He was born at Redhill in 1859. He was educated in engineering and did engineering work on the London & Southwestern at the age of 18. He had been chief resident engineer since 1901, and had had charge of many important improvements on the London & Southwestern, including the rebuilding of Waterloo Station.

G. D. Hughes, trainmaster of the Denver & Rio Grande Railroad at Helper, Utah, died at Salt Lake City, February 28th, aged 36 years.

D. C. Idler, former master mechanic of the Vandalia Railroad, died at Indianapolis, Ind., February 23rd.

David O. Ives, traffic manager of the Boston Chamber of Commerce, died at his home in Boston, March 18th, at the age of 63. Mr. Ives was for about twenty years in the railway service, having been general traffic manager of the Wabash and affiliated lines from August, 1905, to July, 1908. Before his connection with the Wabash he was for many years in the traffic department of the Burlington Lines in Iowa and Missouri.

Edwin Milner, who was a director of the New York, New Haven & Hartford from 1902 until his resignation on January 15th of this year, on account of ill health, died at his home in Moosup, Conn., on February 19th, at the age of 71.

James W. Munn, assistant general passenger and ticket agent of the Chicago & North Western, with office at Chicago, died on March 13th, at his residence in Chicago. Mr. Munn had been connected with the North Western since 1880, and had been assistant general passenger and ticket agent since September, 1912.

Arthur M. Richards, former superintendent of the Chicago & Alton Railroad, died at his home in Chicago, February 26th. Mr. Richards was born in Chester, England, in 1838.

John J. Rogers, commercial agent of the Missouri, Kansas & Texas at Chicago, died in that city, March 7th, aged 67 years. Mr. Rogers had been connected with the Missouri, Kansas & Texas since November, 1888, and had been in railway service 49 years.

W. B. Shepperd, traveling freight and passenger agent of the Fort Worth & Denver City, with headquarters at Wichita Falls, Texas, died in that city on March 5th, aged 30 years.

J. C. Stuart, former vice-president of the Erie Railroad, died at the Garden City Hotel, Garden City, L. I., March 4th, aged 53 years. Mr. Stuart was relieved of the duties of vice-president on account of ill health on January 1st, and since then has been assistant to the president. He took up his life's work while hardly more than a boy. In January, 1888, he was made chief train dispatcher of the west division of the Chicago & North Western Railway, a position he held until June, 1890. Then he was made assistant superintendent of the Galena Division in June, 1892. This position he held until February, 1898, when he accepted the position of general superintendent of the Chicago, St. Paul, Minneapolis & Omaha Railway. Two years later he went to the Baltimore & Ohio Railroad as general superintendent of the middle and northwestern divisions. In September, 1901, he was promoted to general superintendent of transportation of the Baltimore & Ohio System. Mr. Stuart took service with the Erie Railroad on January 1, 1903, when he was made general superintendent of the Ohio Division and Chicago & Erie. After a year's work he was made general manager of the Erie, the position he held up to the time of his appointment as vice-president in November, 1909. In 1912, Mr. Stuart was chairman of the general managers' committee of Eastern roads which successfully carried through the arbitration with the engineers.

William C. Thompson, former auditor of the Southern Railway, died at Thomasville, Ga., March 4th, aged 75 years.

John M. Turner, formerly general manager of the Georgia & Florida, died suddenly on March 21st, at Maxton, N. C.

W. H. Underwood, assistant to passenger traffic manager of the New York Central Lines at Chicago, died in Chicago on Wednesday. He was born May 6, 1858, at Rochester, N. Y., and began railway work in 1874. He was a clerk in the office of the assistant general superintendent of the Michigan Central and clerk in the city ticket office of the Canada Southern at Detroit, Mich., until July, 1878, when he was made city passenger and ticket agent of the Wabash in that city. In April, 1883, he was appointed western passenger agent of the Michigan Central at Chicago, and four years later he became general eastern passenger agent at Buffalo, N. Y. He was promoted to assistant general passenger agent of the latter road in April, 1905, and in September, 1913, was appointed assistant to the passenger traffic manager of the New York Central Lines West at Chicago.

Elhanan Zook, formerly superintendent of construction of the Panama Railroad, until January 4, 1914, died at Philadelphia on January 26th. He had been a roadmaster and trainmaster on the Chicago, Burlington & Quincy, and entered the service of the Isthmian Canal Commission in 1905 as assistant engineer. He was later supervisor, roadmaster, engineer of maintenance, and from June 15, 1913, to January 4, 1914, superintendent of construction.

A New Floating Palace

ON May 30th, the Cunard Steamship Company puts into service their new steamship Aquitania, which represents the last word in ocean-going vessels of the trans-atlantic passenger type. This new marine marvel embodies all those qualities conducive to the structural strength, comfortable habitation, regularity and economy of propulsion at high speed and perfect stability. The following illustrations give some idea of the luxurious appointments of this modern floating hotel.

The Aquitania is 901 feet over-all, with a beam of 97 feet and depth of 64 feet and a displacement of 55,000 tons. A normal sea speed of 23 knots is provided thus enabling the trip from New York to be made in about six days. There are accommodations for 4,210 persons, and of this number 876 will travel first-class; 594 second-class and over 1,700 third-class. The crew numbers nearly a thousand.

The ship is built on the double-bottom principle. The whole double bottom is braced together by longitudinal and transverse struts, and is divided into over forty separate watertight compartments. To meet the stress set up by great waves on the Atlantic, certain parts of the sides or hull are hydraulically riveted and have as much as eight rows of rivets.

An important feature in the Aquitania is that for quite one-half of the length there is that great desideratum, a ship within a ship.. In other words there are two shells of nearly 500 feet of the length of the ship. In addition to this important sea-excluding provision, there are sixteen bulkheads extending athwartship from the port to starboard side. These bulkheads too, have been specially stiffened. Moreover, the decks are made watertight. There is a special arrangement of tanks amidships in order to counteract any tendency of rolling.

As to the general arrangement of the various decks for the convenience and accommodation of passengers, lounge and conservatory combined occupy a space about 100 feet square on deck "A." On the same deck is the first-class smoking room, which will be a particularly pleasing apartment. On this deck also there is the first-class drawing-room forward.

The next deck, "B," is taken up almost exclusively with suites of rooms. There is abundant promenading space, and here again the practice of screening off the side of the ship by sliding windows is adopted, in order to afford protection and an uninterrupted view of the sea for passengers who do not wish to sit in the open.

The third deck, "C," is given over entirely to the staterooms, and fourth deck, "D," to staterooms and the restaurants and cuisine department. The First Class Restaurant is a compartment considerably over 100 feet in length, and the full width of the ship. Forward of it there is a foyer nearly fifty feet long.

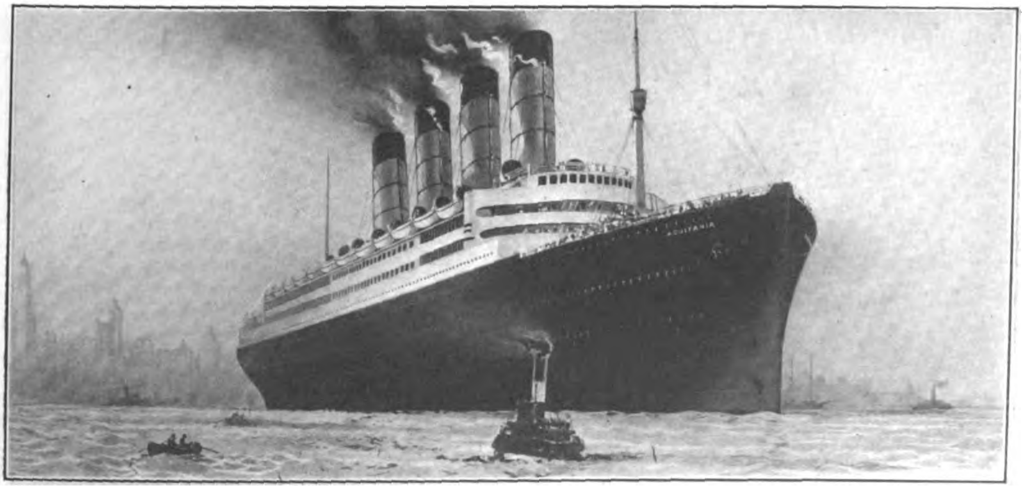
The next deck, "E," is taken up in the central part with the swimming bath and gymnasium, and storerooms for the cuisine department.

The dining saloon for the second class passengers is on the same deck as the first-class dining saloon, but abaft the cuisine department.

The third-class passengers are particularly well catered for in the arrangement of public rooms, staterooms and promenades.

As to propulsion, the turbine machinery working the four shafts, represents the absolutely latest practice. The high-pressure turbine is on one of the wing shafts, while the intermediate-pressure turbine is on the other wing shaft. The low-pressure turbines are on the two inner shafts. The condensing and auxiliary machinery is divided between two separate watertight compartments, thus the engines are distributed over five compartments.

There are astern turbines on all four shafts. Should any turbine break down the steam can be passed to the others, the power of the remaining turbines can be so increased that there need be very little, if any, falling off in speed. While at sea all four shafts will be used, arrangements have been made so that in harbor and particularly in docks, only the inner shafts will be worked. It need scarcely be said that in the engine room every auxiliary which will con-



THE CUNARD LINES NEW STEAMSHIP AQUITANIA.

The Magnificent Restaurant of the Aquitania.

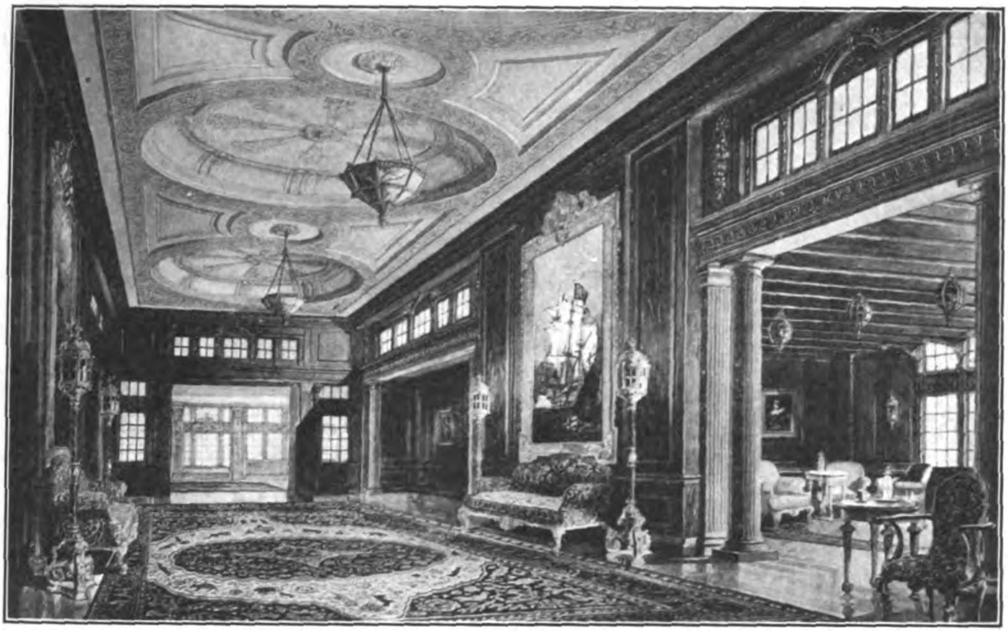
duce to safety and economy has been introduced. The auxiliaries of course, include very extensive refrigerating appliances in connection with the storage of food supplies for the passengers and crew.

The electric power station is equal almost to that of many towns. Not only is the ship very extensively lighted by electricity, but the current is largely used for motors. There are also about 10,000 lamps, and in addition, the electric current is used in connection with cabin bells, telephones, fire-alarms, a complete system of electric clocks, indicators for the watertight door machinery, and other similar purposes.

Steam is supplied from twenty-one boilers each with eight furnaces, and of very considerable power and weight. The boilers are distributed over four rooms. Each of the first, second and third boiler rooms from the bow contains six boilers, while the fourth boiler room has only three boilers.

The four funnels rise to a height of 164 feet from the bottom of the ship and 151 feet from the fire grates of the respective boilers. The boiler rooms, like the engine room, are well equipped with every labor economizing appliance. One of the features of the arrangement of the accommodation for the crew is that it is detached

The First-Class Lounge.



A PORTION OF THE FIRST-CLASS SMOKE ROOM.

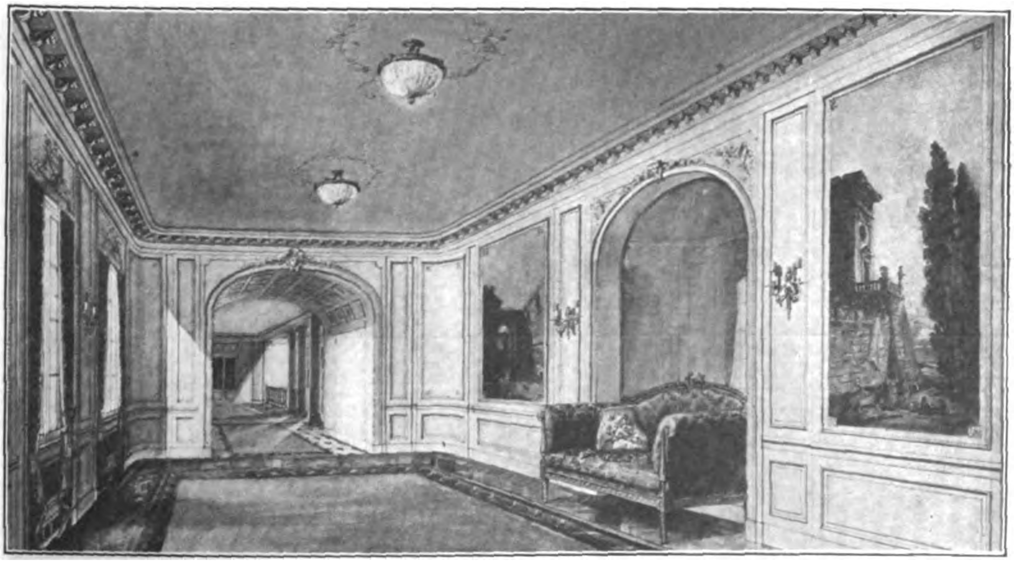
and quite separate from that provided for the passengers.

Regarding the appliances associated with the anchoring, manoeuvring and navigating of the ship the cables are the largest so far fitted, the links being made up of steel about four inches in diameter, while the anchors are each eleven tons in weight. The steering gear is located well below the waterline, where it works direct on to the tiller head. The watertight doors are fitted with Stone-Lloyd quick-closing gear, the officer on the bridge having complete control over every door so that all or each may be closed simultaneously.

The division of the ship into watertight compartments is much more extensive than is required by any regulations yet made. There are two forty feet and two thirty feet motor lifeboats, which will in an emergency, be mother boats to all the other boats, and be able to tow if necessary. Of large rowing boats there are twenty-five and also a large number of collapsible boats. The great majority of the boats are placed under davits and the collapsible boats are arranged, some of them under the ordinary lifeboats and others so that they can easily be moved across the deck on skids to the davits. The motor boats are fitted with wireless telegraphy.

The diameter of funnels is 22 x 15 feet.

The seven ash expellers are situated in the



FIRST-CLASS A SALON.

stokehold, and are used to discharge the ashes through the ship's side below water, clear of all suction pipes aft of the expeller.

They are each actuated by a steam turbine driven centrifugal pump. The ashes are shovelled into a hopper or trough, through a grating which regulates their size, then they are drawn into the expeller and discharged into the sea.

This expeller is so devised that it creates a vacuum about the hopper, drawing in ashes or anything else that might be placed in hopper, and discharging them into the sea, but it is impossible for the sea to return into the ship, as the moment the expeller is shut off an automatic valve closes all communication between hopper and sea.

The Chief Engineer is provided with a well-equipped office and a qualified engineer to do his clerical work. He may, while sitting at his desk, be in close communication with every part of the ship by telephone, and also may communicate with the engineer on watch through a loud-speaking telephone, which can be heard very distinctly from all parts of the office, and is connected to the starting platform in the engine room below. This is, of course, invaluable when the engineer requires the chief's advice in a possible emergency or if the chief has to issue his orders promptly, and is a great advance on the old-fashioned speaking tube. On the wall of the office is fitted a pressure recorder which automatically records the pressure carried on the boilers at every instant throughout the voyage. This enables the chief engineer to keep a close check on the efficiency of his firemen and the engineers in charge of the various stokeholds.

He has also in front of him a dial shaped like the face of a clock but marked in revolutions. This instrument, known as the revolution indicator, is operated by an electric machine on each turbine in the engine room below, so that if he desires to know what revolutions are being made by any turbine he has to simply turn a handle connected with a pointer opposite to the mark H. P. or L. P., as the case may be, and at once the revolutions can be read off the dial. Each propeller goes round 175 times per minute when at full speed.

While the Aquitania has been under construction the ventilation of stokehold and the engine room has been thoroughly considered and numerous experiments made until it is as perfect as modern engineering science can make it.

The pumping arrangements of the Aquitania will be the most complete of any ship afloat. Some idea of the enormous installation may be gained by the fact that nearly 4,000,000 gallons of water can be pumped out in one hour.

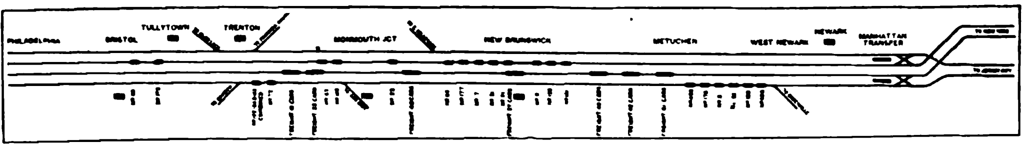
As is only to be expected in such a large ship the staterooms are of exceptional size. They are all above the water line, and with the exception of those designed to accommodate parties of three persons, none of the rooms are fitted with upper berths. Wooden bedsteads are provided, and the wardrobes and other fittings are on an unusually large scale. There is hot and cold running fresh water, and the old-fashioned tip-up wash basins have been entirely done away with. In their place are large porcelain basins, above which are expansive mirrors. Full-length mirrors have also been provided in a number of the staterooms on the inside of the wardrobe doors. An important point is the provision of proper systems of ventilation, giving a continual supply of fresh air, and lighting arrangements.

The vessel also contains a first-class swimming bath. At the side of the baths are a number of cubicles with hot and cold douches. The gymnasium adjoins the swimming bath and is fitted with all those appliances for recreation and exercise associated with the most modern and complete gymnasium.

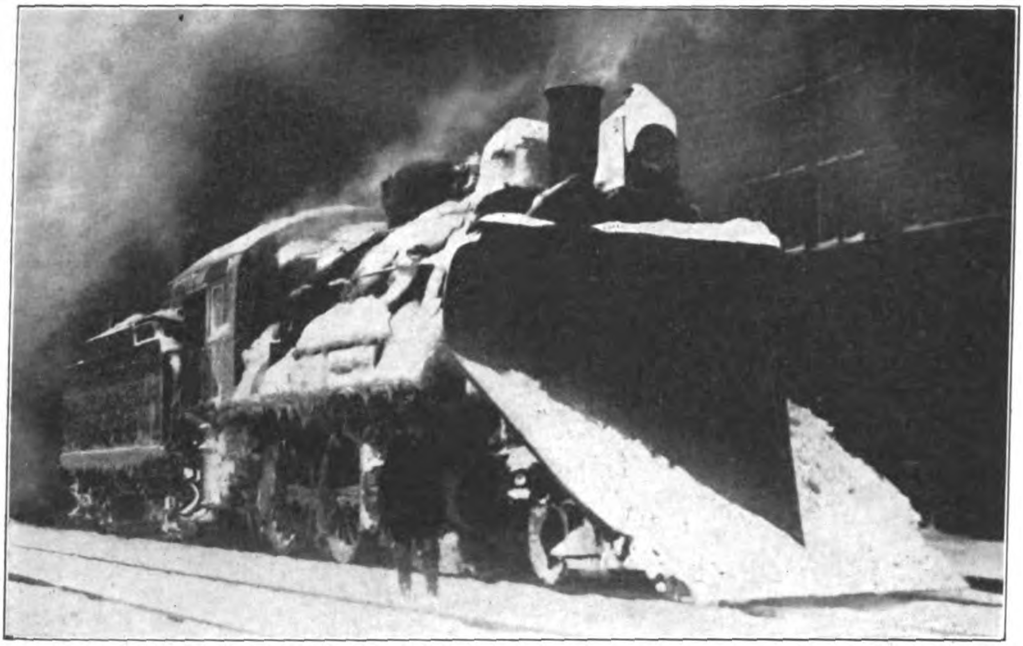
How a Great Railroad Copes with a Blizzard

JUST as the Eastern railways were beginning to congratulate themselves upon the fact of a mild winter with no great snow storms to seriously interrupt traffic and greatly increase operating expenses, the blizzard of March 1st and 2d spread across New Jersey, crippling the railways of that State worse than any other storm in their history.

So severe was its effect that it paralyzed the main line of the Pennsylvania Railroad between New York and Philadelphia, (one of the busiest pieces of railroad in the world) for twenty-four hours. How completely was the tie-up, is shown by the following diagram, the longer arrows denoting the freight train, while the smaller ones refer to the passenger trains. As indicated, twenty-one passenger trains were held up during this period, interrupting traffic between the north and south and between the east and west. Not only was the passenger and freight service temporarily put out of commission, but owing to the terrific gales which accompanied the storm, telegraph wires were down in all directions, adding to the confusion and handicapping the efforts made to re-establish the service. Officials of the Pennsylvania Railroad state that it has cost the road $500,000 to repair the actual damage done and that the loss direct and indirect will amount to $2,000,000.



This diagram shows where trains were stalled on the New York division of the Pennsylvania Railroad during the storm of March 14. The longer arrows denote freight trains and the shorter arrows the passenger trains. As the diagram indicates, there were twenty-one passenger trains stalled between Philadelphia and New York during this storm.



THE APPEARANCE OF ONE OF THE PENNSYLVANIA RAILROAD'S SNOW PLOWS AFTER ITS FIGHT WITH THE DRIFTS WHICH WERE PILED HIGH BETWEEN THE CITIES OF PHILADELPHIA AND NEW YORK AS THE RESULT OF THE STORM OF MARCH 1ST AND 2ND.

How a great railroad fights a storm of this character is interestingly set forth in a bulletin just issued by the Pennsylvania Railroad. Most railroads have a regular storm manual, a book of some thirty odd pages which outlines the work every man is to do in case of a snow storm. No orders are given, they are not needed. Railroad men go out on the line intuitively when trouble seems imminent. They know when a train once gets stalled in a heavy storm, it is doubly hard to start it, and the thing to do is to keep as many trains as possible on the road, but to make them light and equip them with extra locomotives so that they can make speed and plow the snow from the tracks before it gets deep enough to halt the trains.

In coping with the storm of March 1st and 2d, conditions prevailed which required courage, action, ingenuity and initiative. Many officers and employes worked for forty-eight hours without sleep. The superintendent and engineer of maintenance of way and the division operator were on the job from early Sunday afternoon until late Monday, when the blockade was broken. It was their duty to send out trainload after trainload of men to be followed by the necessary commissary trains and wreck trains. They kept in touch by a round about long distance telephone wire with Philadelphia, where others were working to free the division from the storm's grip.

Men out on the road had only one order and that was "get the line open and keep it open." By two or three o'clock Monday morning the east end of the New York division was covered with work trains, wreck trains, and trains full of laborers from Jersey City. Snow plows were bucking the drifts and laborers were shoveling the snow and removing telegraph poles as they came upon them. Drifts four and five feet deep were frequently encountered, while in a number of localities drifts to the extent of ten feet had to be removed.

Laborers were procured from every available source. Harrisburg sent 300 men and Altoona sent 300 on the first order and 500 later on Monday morning. Other gangs came from Pittsburgh and Baltimore, while wreck trains from Renovo and Sunbury, with crews trained to fight blizzards, were rushed to the scene of trouble. From Philadelphia, trainloads of snow shovelers were dispatched as fast as they could be obtained by contractors, and by noon of Monday there were no less than 5,000 men shoveling snow between Jersey City and Philadelphia. As a brakeman of a freight train said when he saw one thousand men at work, "There are enough men out there to eat it."

THIS ENGINE WAS SUCCESSFULLY EMPLOYED IN BUCKING THE DRIFTS ON THE TRENTON DIVISION.

SHOVELING SNOW IN A RAGING BLIZZARD NEAR BRISTOL ON THE AFTERNOON OF MARCH 2ND. THE TIME THE PHOTOGRAPH WAS TAKEN THE WIND WAS BLOWING FIFTY MILES AN HOUR, AND IT WAS SO COLD THAT THE LABORERS COULD NOT STAY OUT OF THE CARS MORE THAN FIVE MINUTES AT A TIME.

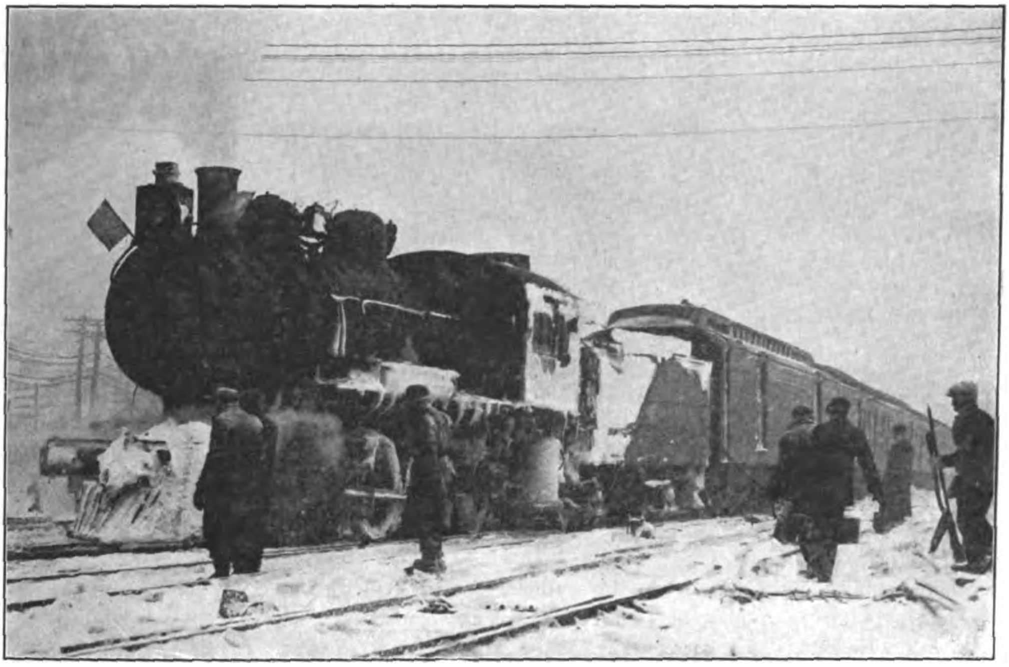
At nine o'clock on Monday morning the storm appeared to have obtained complete mastery, and not a regular westbound train on the New York division was moving, except those that were already out and stranded. Eight passenger trains were stalled near New Brunswick and Millstone Junction; seven freight trains were held up between Jersey City and Philadelphia, but it was not long before the work of the wreckers and snow plows and thousands of snow shovelers began to tell. Many of the laborers, however, suffered intensely, being poorly clad and not prepared to encounter such intense cold. Dozens of ears, hands and feet were frozen but through it all the work was being rapidly and efficiently pushed with the one object in view of getting the road open as soon as possible.

Not one of the small problems confronting the management was the task of feeding for three days 5,000 extra laborers and 2,300 regular men, stretched out over ninety miles of railroad with no means of communication. These men were working against overwhelming odds and could not be expected to make much headway without food. At Philadelphia, the engineer of maintenance of way had charge of the commissary. The restaurant at Broad Street Station, Philadelphia, was kept open all Monday night and more than 60,000 meals were sent out on special trains to feed the men as they found them along the road. The same thing was done on the Jersey City end and commissary trains were sent out as fast as the food could be prepared. In addition to the commissary trains from Philadelphia and Jersey City, track supervisors at Tacony, Trenton, New Brunswick and Jersey City, supplied laborers with food from nearby restaurants. Sandwich and coffee comprised the menu of most of the 100,000 meals the railroads served to its forces between Sunday and Thursday.

When the blockade began the first thought of the railroad officers was naturally the welfare of the passengers in the stalled trains. They had to be made comfortable and fed until the trains could be started. Fortunately many of the marooned trains carried dining cars where the passengers could obtain food. All meals, beyond those regularly served for a train on time, were supplied free. In the neighborhood of New Brunswick there were nearly one thousand passengers to be taken care of, and the activities of the station force at this point, well illustrates some of the unusual things a railroad sometimes has to do to provide for its passengers.

The agent at New Brunswick got in touch with the conductors on the several trains Sunday night and told them to announce through their trains, that if any passenger wished to leave and go to a hotel, the company would be very glad to do anything in its power for their comfort. He also told the conductors that they should serve dinner and luncheon to all passengers irrespective of who they might be.

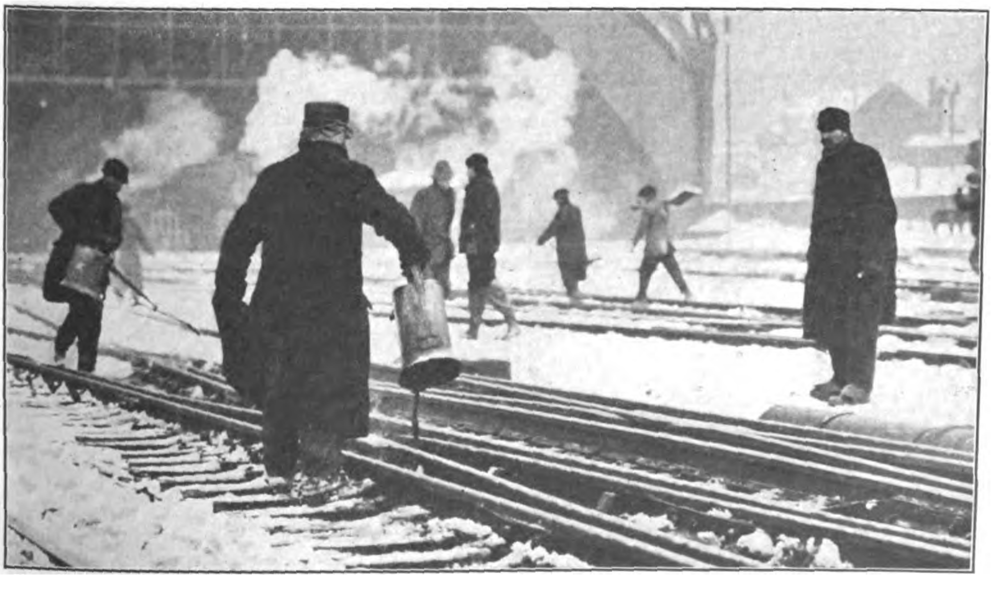
At the New Brunswick station the company aided a great many passengers by sending messages to their families and friends, among them was Thomas J. Marshall, vice-president of the United States. The station force used an extra



THE CONGRESSIONAL LIMITED, ONE OF THE PENNSYLVANIA RAILROAD'S CRACK TRAINS RUNNING BETWEEN WASHINGTON AND NEW YORK, IS HERE SHOWN ARRIVING AT MANHATTAN TRANSFER, FIFTEEN HOURS LATE.

engine and crew from 10.30 Monday morning until 1 P. M. to distribute food to the trains near New Brunswick. They had three miles of trains to cover and they were making sure that no passenger should want for coffee or eatable. They had all passengers fed in an hour.

When the New York-New Orleans Limited and the Sunday evening five o'clock express train from New York to Philadelphia reached Trenton on Monday noon, the passengers were sent to Trenton hotels as guests of the railroad. They remained there until six o'clock, when they went to Philadelphia on Train No. 65 which had worked its way to Trenton in the rear of a snow plow. On the Congressional Limited, one of the westbound trains, the dining car was kept open and many of the passengers formed groups and played cards. The engineers kept steam up so that the cars were warm and comfortable. As indicating the spirit of general good fellowship which



EMPLOYES BURNING PITCH FOR THE PURPOSE OF MELTING ICE BOUND SWITCHES. THIS METHOD IS LARGELY EMPLOYED BY THE PENNSYLVANIA RAILROAD DURING COLD WEATHER IN ORDER TO FREE THE MOVING PARTS FROM ICE.

prevailed, several of the passengers, the following morning, gave their breakfast to the flagmen and other employes who were endeavoring to remove fallen wires from around the train.

At the railroad offices of the Pennsylvania station in New York, a record breaking situation had to be dealt with on Monday morning, and no time was lost in notifying passengers of the actual conditions. Large notices were posted on the gates to tracks on which trains were scheduled to depart, which read:

"The road is tied up as far west as Trenton, and there is no possibility that trains will move to-day. Trains may move this evening, and full announcements will be made well in advance of each departure. Persons having New York hotel or residence addresses are advised to leave their telephone numbers with the station master and return to their homes to wait the departure of trains in comfort."

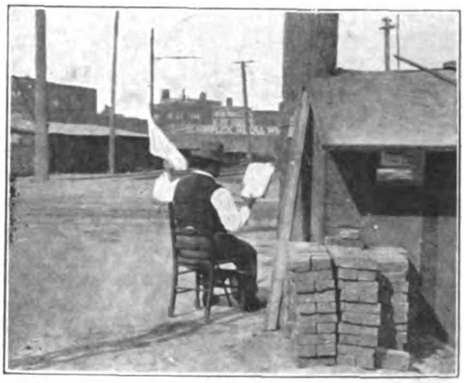
The passenger department arranged to extend the limit of all tickets which, due to the blizzard, could not be used before their time limit expired. Eight hundred people slept in Pullman cars in the station Sunday night. One man woke up believing he was in Pittsburgh. Twenty-five hundred people remained in the trains in the station Sunday night, among them members of twenty-two theatrical companies. The Pullman Company redeemed $600 worth of Pullman tickets Sunday night in New York.

By Monday night all the snow was cleared and the trains started on their way, most of them just twenty-four hours late. It was eight o'clock Monday night before a regular train left either New York or Philadelphia. On Tuesday morning, trains were compelled to run slowly as the dispatchers had great difficulty in getting orders to them, but the blockade by that time had been thoroughly broken and service rapidly improved until it became normal. By Tuesday evening trains were leaving their terminals on time, arriving from an hour to two hours late. By Wednesday morning they were only a few minutes late going over the New York division and by Wednesday night they were on time, in spite of the fact that practically all the regular wires were still out of service. Train dispatchers kept in touch with trains on the road as best they could and gave their orders verbally. Underground long distance telephone wires were used for communicating between New York, Jersey City and Philadelphia. Complete train service was resumed Thursday.

Teaching Railroading by Pictures

THE Pacific Electric Railway Company, of Los Angeles, has inaugurated and adopted a system of illustrated lectures by which the different conditions and problems which confront the employe in his daily tasks are brought before his eyes in the form of pictures, illustrating the manner in which they may be most easily and satisfactorily solved. While the system is comparatively new, the results already obtained are of a most gratifying character. The lectures are well attended and the employes are showing an appreciative interest in the efforts being made to explain the technical and general points liable to confront them in their daily occupations. The pictures, which are of a most practical character, are accompanied by suggestions or explanations by the lecturer, all of which tends to make them more interesting. The success of the idea may be seen when it is stated that since the pictures have been introduced the general attendances have been three and even four times as large as they were formerly.

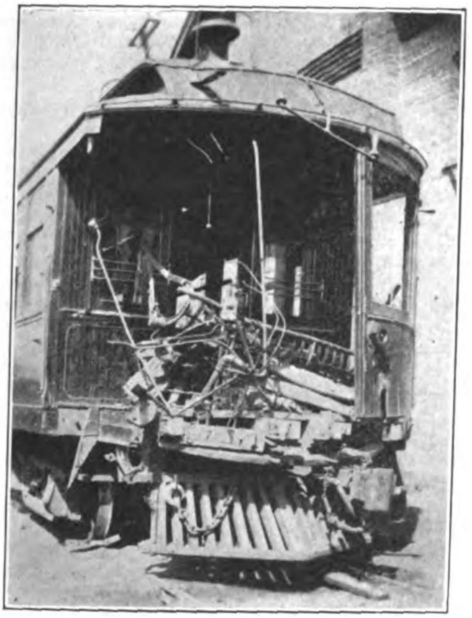
Lecture Room in Which Charts, Moving Pictures, Etc., are Employed to Increase the Interest of the Employe.



Illustrating the Careless Manner in Which Flagmen Sometimes Signal Trains While Reading a Newspaper.

In this illustrated lecture work, both the stereopticon and the moving picture projector are employed.

Many technical points may be satisfactorily illustrated by a single view, the lecturer using a pointer to designate the different features as he proceeds with his narrative. For instance, a picture of a headlight is thrown upon the screen and several minutes will be given by the speaker in explaining the use of each part of this feature, also showing and telling the men what to do in case of trouble with this particular article. By this type of picture is also shown the wrong method of doing certain things connected with the business, these pictures always being followed by illustrations showing the ways in which these things should be done. To illustrate this point we might draw attention to two of the accompanying illustrations. One shows a flag-

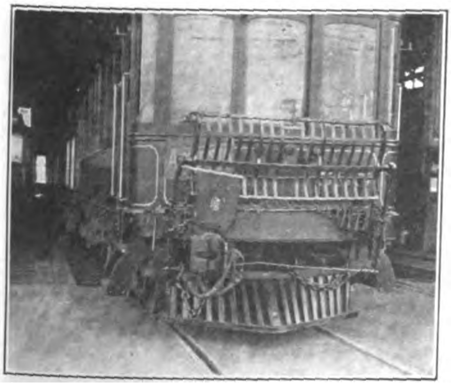


The Damage Shown by This Illustration was the Result of a Disobeyed Order.

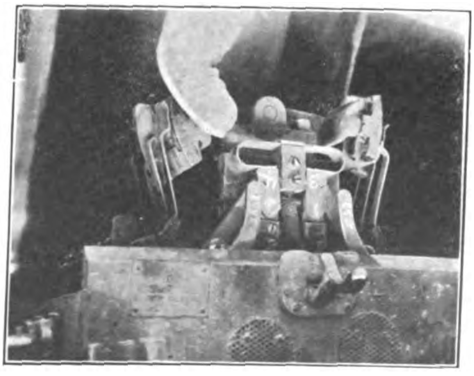
An Unbecoming Attitude Which is Strikingly Shown in the Accompanying Illustration. The Picture Also Serves to Show an Employe Breaking a Rule of the Company by Talking to the Motorman.

man sitting in a chair beside the track flagging an approaching train to proceed ahead, at the same time never removing his attention from the paper which he is reading. Immediately after this slide is shown comes a picture showing how the flagman, before signalling to an oncoming train to proceed, should walk to the middle of the track or in such a position as will enable him to see for a long distance up and down the track, and looking in both directions, before raising the white flag. The other shows how some employes throw the reverser with their feet, this being followed by a picture illustrating how this action, if properly done, is executed by hand.

In these lectures the point emphasized most emphatically is "Safety First." The men are instructed to care first for the safety of the public, next for the property of the company, and later for economy of power. In connection with this "Safety First" idea, both the stereopticon and moving pictures are employed, the "movies" being used where the stereopticon does not entirely "cover the ground." One set of motion pictures shows a high bridge, from the approach of which the structure cannot be seen. A short distance on either side of the bridge is a large "SLOW" sign, this being so conspicuous that it is almost impossible for the motorman to miss seeing it. The first picture shows a train approaching the bridge and when the "SLOW" sign is encountered the motorman heeds the warning and applies the air. Upon starting across the bridge he see that someone, who had started to walk across the structure has been caught in the middle of it. On account of obeying the orders of the "SLOW" sign the driver is able to stop his car without injury to the party caught upon the bridge. Immediately after this picture is run comes a series of motion pictures showing



The Flag System, with Flags Colored, is Thoroughly Explained by the Pictures.



Photograph Showing the Wrong Method of Throwing the Reverser.

a careless driver rushing by the "SLOW" sign without even giving it a glance. His car starts across the bridge and he notices the man in the center. The air is applied but this is unable to overcome the excessive rate of speed at which he had been traveling and the unfortunate man (a dummy being used for this picture) is overtaken and cut to pieces beneath the wheels of the car.

Following a number of these moving pictures showing the violation of the rules and laws of the company, stereopticon pictures showing wrecked cars which are the result of disobedience on the part of the car drivers, and, very often, conductors. At this point figures showing the loss to the company per year through smash-ups of different kinds, caused by non-obeyance of rules, are thrown upon the screen. It is also emphasized that the company cannot afford to retain employes who now and then disregard the rules that have been laid down for them. "If the intention was that these rules and regulations were not to have been recognized and obeyed, they would never have been made."

Another point which is emphasized is that of the appearance of the company's employes while on duty. Many of the men were "snapped" by the photographer during working hours, in positions which were anything but refined. In many instances these men did not realize that their attitudes were anything out of the way, but when shown on the screen these pictures made, these men, and many others, "see themselves as others see them." It is a source of amusement for the men to "jolly" their workingmates who happen to have been unfortunate enough to have been photographed in any awkward position or undignified attitude.

A number of pictures are shown of employes violating rules publicly that have wisely been laid down for the safety of the public and of the company's property, these including talking to motorman, etc. Several pictures show groups of employes, including the conductor of the car upon which the photograph was taken, laughing and joking, during which time passengers upon the car were being neglected.

Throughout these "entertainments" by which term these illustrated lectures have grown to be known, sections of the rules of the company are thrown upon the screen. When a certain part of the work is being described, sections of the rules pertaining to these parts are projected. For instance, when the various flag signals are being illustrated, the rules and laws governing these signals are shown before or after the flag to which it refers. Every section of the work is taken up in connection with these pictures and when certain points are being discussed suggestions and helpful ideas are offered by experienced trainmen as to the best way to meet these unusual happenings or every-day circumstances.

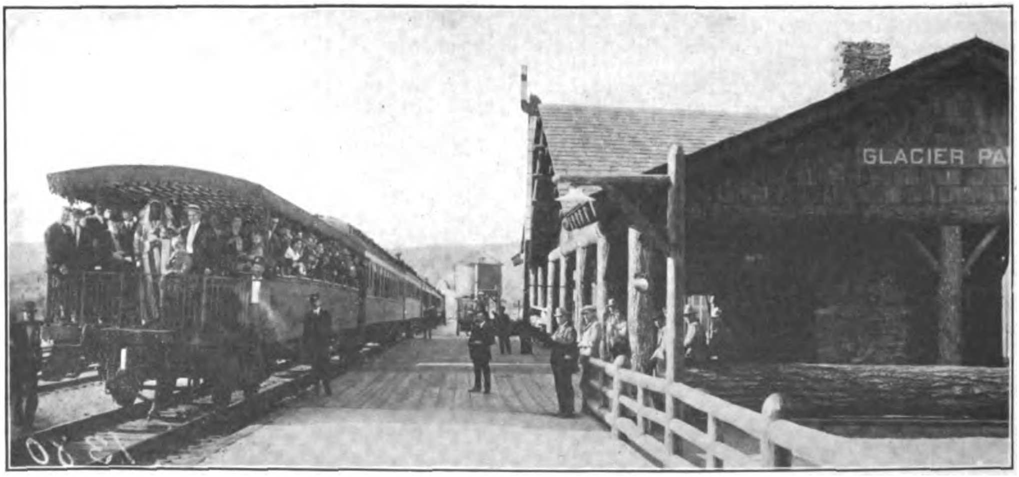
Conducted in conjunction with this illustrated lecture course is a black-board system, in which well-informed instructors "SHOW" rather than "TELL" the recruits and often many of the men older in the service, how certain problems should be handled. This course is complete and quite effective.

There is something like 1,600 men in the employ of this company, and in order that all of the men might have the benefit of these illustrated lectures the various pieces of apparatus necessary for these programs are transported to various points of the company's system, remaining in each district for a stated length of time. So successful has this picture method of instruction become that other railroads are contemplating adopting it, representatives of various roads having already visited Los Angeles for the purpose of investigating its various features.

Opening Up the Glacier National Park in Montana

AUTOMOBILING in Uncle Sam's newest playground—Glacier National Park — not only has opened the way for the most modern mode of travel into America's prettiest mountain scenery but it brings together for unique contrast upon the same scenic highways, the big touring car and Indian travois.

The Blackfeet Indians, who are inseparably identified with the new National Park up in Northwestern Montana, like the automobile as



Oriental Limited at the Glacier National Park Depot.

a curiosity but they prefer to stick to their ponies and use the travois whenever they have any toting to do. Thus the strange meeting of these two widely different types of transportation vehicles upon the roads in Glacier Park furnishes quite an odd spectacle to the summer tourist.

Glacier Park is one of a few of Uncle Sam's playgrounds the automobile has invaded. The "See America First" tourist now may take an automobile ride into the heart of the Switzerland of the New World, as the result of the building of a $100,000 scenic highway by Louis W. Hill, chairman of the Board of Directors of the Great Northern Railway. Before this great roadway was hewed through the mountain and forest fastnesses travel by trail was the only means of penetrating the scenic marvel land which for thousands of years had been the hunting grounds of the Piegan Indians.

This roadway, which Mr. Hill personally helped to lay out, begins at Glacier Park Hotel, Glacier Park Station, Montana—which is regarded as the most unique hostelry in the world. It cost $150,000 and is built of huge cedar and fir logs and has an open camp fire burning in the center of the lobby on chilly evenings. The glow from this camp fire lights the lobby and the three tepees pitched in the lobby as card tooms, together with the rafter and wall Indian decorations form a novel picture for the eastern tourist to gaze upon.

Panama Canal Developments

THE first towing locomotive of the forty ordered for employment on the Panama Canal reached the Isthmus on January 27th, and has been installed on the west side of the center wall at Gatun Locks. Beginning with February 16th, tests of this locomotive have been conducted each week day consisting principally of operating it back and forth along the rack rail, including the inclines. A second machine has been more recently received and four are to be delivered on or about the 15th of each month until all deliveries have been effected. A schedule has been prepared by the First Division for the installation of the locomotives, as follows:

No. of Shipment.	Date.	Destination.	Locomotive. Nos.
1..........	1-15-14	Gatun	641
2..........	2-15-14	Gatun	642 to 644
	2-15-14	Miraflores	681
3..........	3-15-14	Pedro Miguel ...	666 to 669
4..........	4-15-14	Miraflores	682 to 685
5..........	5-15-14	Gatun	645 to 648
6..........	6-15-14	Pedro Miguel ...	670 to 673
7..........	7-15-14	Miraflores	686 to 689
8..........	8-15-14	Gatun	649 to 652
9..........	9-15-14	Miraflores	690 to 693
10..........	10-15-14	Gatun	653 to 656
11..........	11-15-14	Miraflores	694 to 696

The numbers were chosen in the 600 series in the general numbering system of all machines, float wells, transformer room, and other equipment.

The watchman service of the Panama Railroad was reorganized, effective March 1, according to the following general provisions: The position of chief inspector was abolished, and the watchmen were placed under the immediate orders of the company's representatives at the various points. Those at the Panama freight station and in the Panama yard are in charge of the local agent at Panama. The watchmen at the company's piers in Colon have been placed under the receiving and forwarding agent for that port; the guarding of the docks in Cristobal is in charge of the Division of Police and Prisons. This division also took over the patrol of the wharves at Balboa and, as it did several months ago while in temporary charge, assigned to this work nine colored policemen. This provided continuously a gateman and a patrolman on the steel pier and annex, and a patrolman on the new concrete wharf.

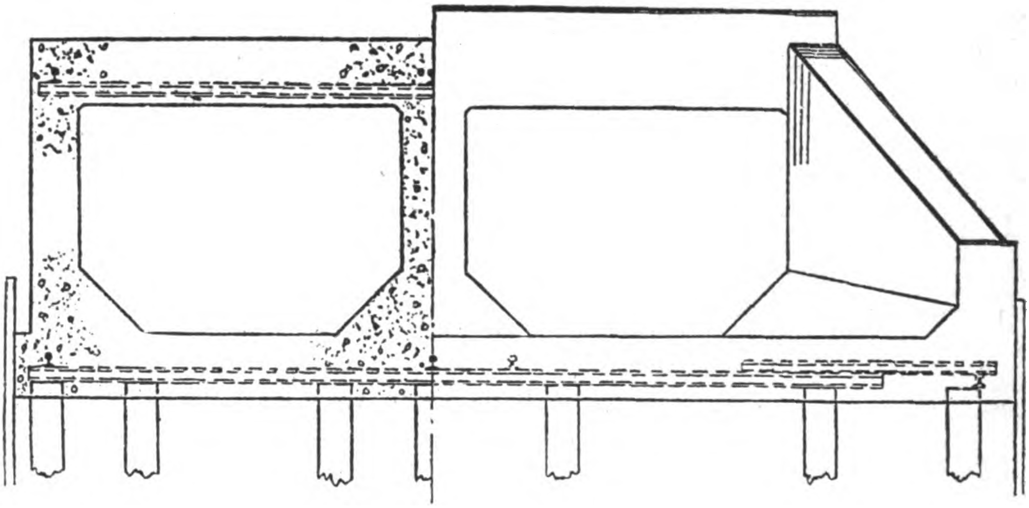
Foundations for the track-span bridges of the high tension transmission line have been installed between Mount Hope and Diablo, and their installation is now advancing south of Diablo, along the right of way of what will be made the permanent main line of the Panama Railroad, running into Balboa. About twenty foundations are yet to be placed. At Corozal, their placing required the moving of two crossovers, the shifting of the spur leading to the commissary building, and throwing the temporary track south of Corozal, known as the sand line, to the west, placing it on a center of 19 feet 6 inches from the southbound main of the Panama Railroad. At Gamboa bridge, across the Chagres River, the placing of foundations is delayed by the work of erecting brackets, which are also to support the highway and foot bridge being erected by the Panama Railroad on the east side of the bridge. Two foundations, caught in small local slides near Radio Station, are being reset.

The erection of the track-span bridges is following closely the completion of foundations. The bridges are in place between Mindi and Pedro Miguel, with the exception of seven at Gamboa bridge, five at Frijoles, and two or three others which cannot be erected at present on account of some local interference.

The one ground wire and three power wires which are suspended on each side of the track, have been strung between Radio Station and Pedro Miguel, with the exception of the gap at the Chagres River. The insulators are placed at about the same time the bridges are erected.

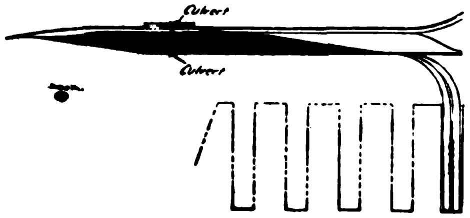
The steel work for the transformer substation at Gatun has been completed and erection of the walls of hollow concrete block has begun. The steel work at the Miraflores substation is practically completed. Filling for the site of the substation at Cristobal, east of Camp Bierd and opposite the proposed Atlantic entrance coaling plant, is in progress and the Panama Railroad is making preparations for driving the piles to support the building. Bed rock beneath this area lies from 35 to 45 feet below sea level, and the station will be supported on about 600 timber piles. Part of the foundation steel has been delivered at the site, in readiness for the beginning of building operations.

The diversion of the main line tracks of the Panama Railroad to serve the new town of Balboa, and the construction of a number of yard tracks in connection with the new pier, have made necessary a suitable crossing over the Curundu River at the point indicated in the attached sketch (A). The Curundu is a small stream that drains



Sketch B—Showing Ends of Openings in Double Box Culvert with one of the Wing Wall Sections.

the meadows lying east of the present Panama Railroad main line, a section of the district of San Miguel in the city of Panama, and the greater part of the swampy area between Ancon and Diablo Hills. Its discharge, except after heavy rains, is insignificant; at the present time it amounts to almost nothing; but it is subject to a tidal flow along its entire winding course through the swamp, and as far back as the railroad crossing above referred to. A part of the swamp has been filled with material pumped by suction dredge in excavating the inner harbor at Balboa, and to avoid blocking the Curundu, while the work is in progress, its channel was deepened, and the earth taken therefrom was used to form levees on each bank.



Showing Culvert Over Curundu River, and Railroad Track Layout in Relation to New Balboa Pier.

The adopted plan for the new crossing of this stream provides for a box culvert, with two openings, which, on account of the numerous tracks to be laid over it, will have a length of 307½ feet, between portals. Each opening will be 10 feet wide, and seven feet high, square at the top, but with the corners cut off at the bottom. The wall between the openings will be two feet thick, the outside walls one and one half feet thick, while the floor and roof will be two feet thick. On each side there will be an apron nine feet wide between wing walls. The entire structure will be of concrete, heavily reinforced, and founded on about 600 piles penetrating to rock. The piles have been driven, and about 100 feet of culvert have already been finished. The floor of the bridge will be at elevation plus three feet above mean sea level, and not much work is required in excavating the pit for it. The ground at this point is very soft, and to prevent caving in during construction and underwashing of the finished structure, the pit (with a width of 25 feet) is entirely enclosed in sheet piling. The culvert is designed to support a wagon road of standard width, two tracks of the Panama Railroad main line, and 16 yard tracks. The tracks and road will cross the culvert at right angles, as shown in Sketch B, and will be placed on a 2½-foot fill of earth to be made over the roof of the structure. This will be the fourth culvert constructed over the Curundu River; one now spans it on the old Corozal wagon road, one on the new Corozal road, and another for the present railroad crossing.

In order to prevent the tidal flow from ascending the river east of the new culvert, automatic tidal gates will be installed at the west end of the bridge, one to cover each opening. These gates will be constructed of 4-inch timber, heavily bolted and braced, to be hinged to the upper edge of the opening. Their operation will be entirely controlled by the tidal rise and fall. When the tide rises above the water level in the swamps, the beginning flow will serve to close the gates against the culvert openings, and when it falls below that level, the accumulation of the natural flow of the stream on the other side of the gates will push them open, allowing the water to escape. This device will prevent the inundation of the low parts of the swamp twice every 24 hours, as now, and will prevent also wearing of the bed of the Curundu by rapid currents caused by the tidal flow.

"The only way to turn away the wrath of an irate passenger is to greet him with a smile. One who works with the traveling public must remember that many of the patrons of a railroad often are under a nervous strain. Some are going to the funerals of a father or mother, and others are answering disagreeable calls. The passenger ALWAYS should get the benefit of a doubt. It is seldom you see one a second time and he should carry away a pleasant remembrance of the city and the railroad company."—Calvin Dutton.

Recent British Railway Developments

(From our London Correspondent.)

Britain Buying Locomotives.

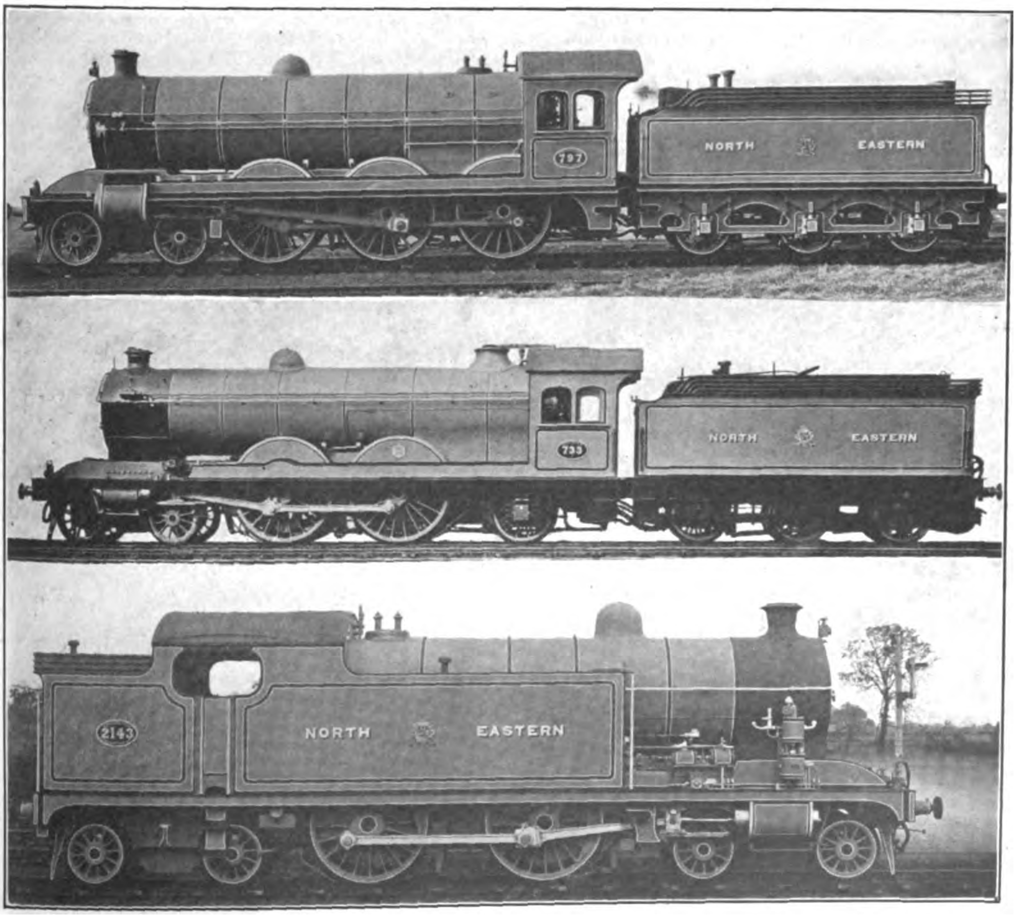
BRITISH railway boards are apparently eager at the moment to follow foreign methods. Close on the heels of the Great Eastern's appointment of an American as general manager comes a report that the South-Eastern and Chatham are going to Germany for locomotives.

I am informed from an authoritative source that the directors of the South-Eastern and Chatham Railway, with a view to providing more adequate locomotive power for the working of their continental boat express traffic, have just recently placed a contract for ten powerful locomotives with A. Borsig, a well known German locomotive building firm, whose works are at Tegel, near Berlin. Although, some nine years ago, the Great Central, Great Northern, and Midland companies introduced a number of goods locomotives which had been built at the Schenectady works of the American Locomotive Company and at the Baldwin works, Philadelphia, and the Great Western Company introduced into their Paddington and Plymouth express service an experimental de Glehn locomotive, built in France, no German-built locomotives have ever been imported into Great Britain with the exception of small narrow-gauge engines for contractors' purposes.

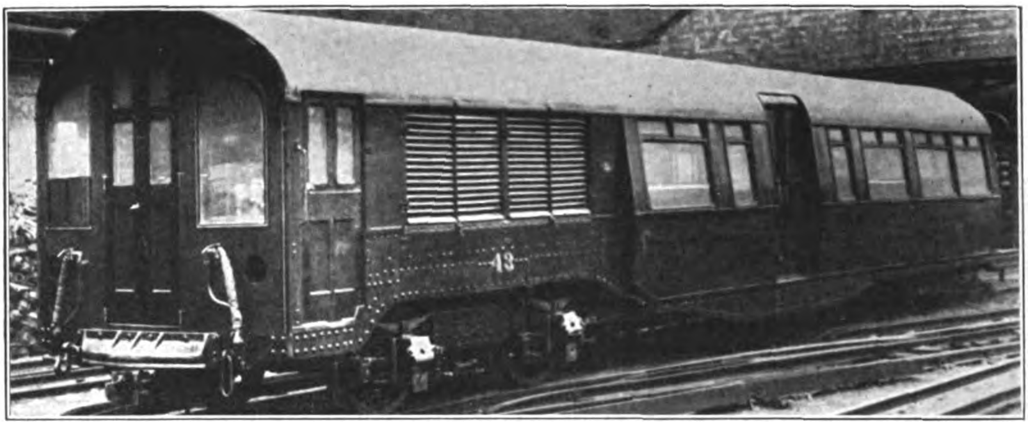
In explanation of the placing of this order in Germany, it is stated, that owing to the present prosperity of the British locomotive and railway rolling stock industry, sufficiently early delivery could not be guaranteed by leading builders in this country quite apart from the more favorable price quoted by the German builders. The South-Eastern and Chatham Company in order to meet immediate requirements, have lately obtained on loan from the Great Northern Railway Company the use of fifteen four-wheeled coupled bogie locomotives, several of which have already been put to service on the South-Eastern and Chatham line.

New Locomotives.

The accompanying illustrations are of three of the newer North-Eastern locomotives. In one of these the Stumpf cylinder arrangement on the uniflow principle has been applied.



RECENT TYPES OF LOCOMOTIVES PURCHASED BY THE NORTHEASTERN RAILWAY OF ENGLAND.



New All-Steel Car for London Underground Railway.

New Steel Middle Door Carriages for London Underground Railways.

THE underground or tube railways of London are being continually improved and one line of development concerns the rolling stock. Even the old cars and motors on these lines were ahead of the rest of the country and the progress is being continued with all fresh stock.

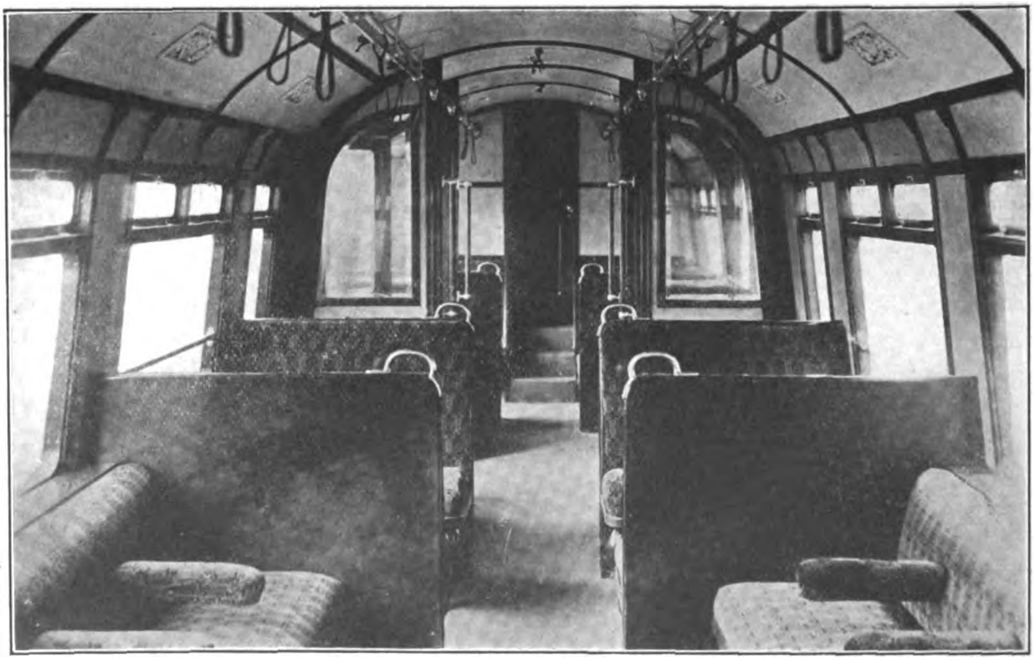
At the beginning of February new all-steel cars were introduced, including many improvements. For one thing middle doors have been installed in addition to the end entrances and exits. These middle doors are double hinged and open inwards. They are operated by the passengers and close automatically.

Electrically controlled locks are fitted to the doors so that the gateman on the end platform can lock and unlock the doors. The operating switches are connected with the levers which open and close the ordinary gates at the end platform of car. Small red and green lamps are fitted at the end platform so that the gateman may see that the doors are locked before starting the train. Experimental cars fitted with middle doors have been running on the Piccadilly line for some time and have been found very useful for dealing with very heavy traffic.

The new cars are arranged with arch roofs, in place of the clerestory roof, to increase the interior air space and facilitate the fitting of middle doors.

The seats and backs are constructed of woven wire and are upholstered in moquette velvet and fitted with arm rests projecting from the seat backs.

Sanitary fireproof composition is used as flooring in place of wooden slats.



Interior of New All-Steel Car for London Underground Railway.

The cars are equipped with emergency electric lighting supplied from accumulators. Emergency lights are automatically switched on in the event of failure of the ordinary supply current.

The cars are constructed entirely of steel and other metals except for a small portion of wood which has been rendered fire-resisting.

The electrical equipment is of improved design and the cars are mounted on bogies specially designed to give smooth running and reduce noise.

The new cars will be fitted with white enamelled steel covers on the hand straps.

Hitherto the carriages used on all the London tube railways have only had two doors (in the end motor coaches only one means of entrance and exit is provided for the use of the public) but as will be seen the new cars built for the London Electric Railway (which is the official title of the combined underground and tube railways) are equipped with a third door in the center of the vehicle. This may be regarded as putting an end to a controversy that began with the electrification of the Metropolitan and District Railways. With the exception of the motor coaches, the vehicles used for the District's electric service have been of the three-door type from the outset, while the others dispensed with the center door. Both types of vehicle have their partisans. The car with three doors can discharge outgoing passengers and receive new ones in shorter time, and as the duration of the station stops is a very important factor in determining the speed and frequency of the underground train services, this is a very great advantage. But, on the other hand, the provision of an extra door means a reduction in seating accommodation so far as open cars are concerned, and as the accommodation is never quite enough during the rush hours this is a decided drawback. It seems, however, to have been discovered in practice that the operating advantages of the three-door car outweigh its drawbacks. It will be seen that this development also follows upon tests undertaken on the New York "subway," which I understand show the provision of doors at the middle as well as at each end to be desirable. It does not appear likely that any more coaches without central doors will be built for the London underground railways.

No fewer than five types of central door cars have been experimented with in an endeavor to find a type which would meet traffic conditions on the London tube railways. It is understood that the type of car which has now been evolved shall form the future train unit of tube railways. Some interesting calculations have been made as to the advantage of the central and end door car over the end door type. It was found that if only ten passengers per car had to be handled there was an actual loss of time in the use of the central door owing to the extra work thrown on the conductor. With fifteen passengers entering and alighting the time was the same as with the old type of car. From that point onwards conditions were in favor of the new type, and when forty passengers were being handled the economy in time saved on stops at stations against the old type of car was 38 per cent.

The companies are also eliminating the inflammable element in the coaches.

In recent years great attention has been given to the question of fireproofing, with the result that not only is the woodwork being rendered fire proof, but every year marks a closer advance to the ideal of the "all-steel' coach. On the London Electric Railway steel construction is already used on about 480 vehicles, and there are some eighty of similar construction running on the District Railway. The Central London, which was a pioneer in this direction, has some steel cars on order for use on its Ealing extension, and the carriages which will be used for working on the through London and North-Western Bakerloo service on the opening of the extension from Paddington to Queen's Park will also be of steel.

Porcelain straps for strap-hangers, center swing doors, and more cross-seats are among the improvements in the new cars which are running on the Bakerloo Tube Railway. This railway is one of the half dozen tube lines that are operated under the general title of Underground Railways of London. J. P. Thomas, superintendent of the Underground railways, speaking to your correspondent said that the new straps will be hygienic as they can be washed. Twin-doors in the center of the carriages will open inwards, requiring but a gentle pull from the passenger. When the train starts these doors will be secured automatically. An electric bolt will fasten them at the moment the conductor on the platform between the carriages closes his gates. The doors will be connected electrically with pilot lamps on the conductor's platform and in the driver's cab. These lamps will go out when the doors open and light up when they shut, thus assisting drivers and conductors in their control of the train. At present there are no center doors in any of the tube trains with the exception of an experimental train running on the Piccadilly tube. Other improvements are:

1. Less stuffy carriages. A continuous flow of fresh air will be forced in from ducts connected with a special chamber. The roofs are arched, thus giving more air space.

2. Better lighting. The lamps will be placed at an angle so that the glare will not shine in the eyes of a passenger looking across the carriage.

3. More cross-seats. All seats will have arms and be covered with the material known as moquet—more comfortable-looking than rattan cane seats.

4. Improved springs in the trucks will secure easier running.

5. The cars will be all-steel with the exception of the window sashes and the floors, which are non-inflammable.

Electric Lighting for Trains.

THIS is a subject which has recently been discussed at some length in the British newspaper press. Our railways have been slow in adopting electric lighting for their passenger trains, not for the reason that it was unsatisfactory as a means of illumination or that there was no reliable system available, but rather on account of the comparatively high capital expenditure that would be required. When electric lighting was introduced commercially the majority of trains were lighted by compressed oil gas, except in some few instances where oil lamps were still employed. At that time, according to T. Ferguson, who read a paper on train lighting before the British Institute of Electrical Engineers, the gas-lighting plant installed represented a very large capital invested in gas-manufacturing plants, compressors, and traveling gas tanks, as well as storage cylinders and rolling stock equipment.

The author of the paper considered that the cheapest form of train lighting would be the installation of high-speed steam-driven generators on the engines, with suitable flexible cable connections from locomotive to carriages, the latter being wired in the usual way. To some extent, as readers of the RAILWAY WORLD will be aware, this system is already used in America, and it has been found to be the cheapest in first cost and subsequent maintenance. It has, however, certain inconveniences which need not be dwelt on at length, chief of which is that the locomotives have to remain attached to their trains longer than would be otherwise necessary. The individual unit as already used on many of our British lines, is particularly well adapted to the requirements of the railways, as each coach so equipped is an independent unit and can be run anywhere on the railway, no storage tanks being necessary.

Superheated Steam.

A SAVING in coal consumption of no less than 30 per cent is stated to have been recorded by the Midland Railway in comparative tests between a locomotive fitted with a superheater and one of similar design less the superheater. Another comparison of consumption per ton mile shows an average saving of 23 per cent in coal and 22 per cent in the quantity of water used.

These interesting results were given by Henry Fowler to the British Institution of Civil Engineers in a paper setting forth the advantages of and difficulties encountered in the use of superheated steam in locomotives. The utilization of steam superheated, said Mr. Fowler, has engaged the attention of engineers since the middle of the eighteenth century. Its application in locomotives was suggested over 85 years ago, and for half a century many attempts were made to employ it in this class of engine, but owing to trouble arising from the packing and the lubrication these were not successful.

The type of superheater now in most general use is that in which the steam receives its superheat when passing through small tubes placed in large smoke tubes through which the heated gases travel on their way from the firebox to the chimney. This type is general in this country, where, in addition to the Schmidt system, the Swindon and Robinson systems, which differ from the Schmidt in detail only are also employed. The utilization of the heat in smoke-box gases has been tried repeatedly but without much practical success.

Under ordinary conditions, when an engine is running the steam passing through the superheating elements carries away with it sufficient heat to keep the metal of the elements comparatively cool. When, however, a locomotive is running down an incline without steam this does not occur, and it becomes necessary to prevent the gases from passing through the fire tubes. This is effected by a damper or some other type of retarder. Arrangements are generally made for working the dampers or retarders automatically.

The greater volume of superheated steam, when compared with saturated, has in many cases led to the adoption of larger cylinders and lower boiler pressure. This leads to economy in boiler repairs, which may counterbalance the increase of maintenance necessary for the extra apparatus required when superheated steam is used. The degree of superheat usually employed is 230 degrees to 260 degrees F. No figures at present seem to be available for the variation in the economy with varying degrees of superheat.

Experiments have been carried out to ascertain the effect of superheating the steam supplied to the high pressure cylinder of a three-cylinder compound locomotive and it has been found that a saving of coal of 25.9 per cent and of water of 22.3 per cent has resulted when comparison is made with a similar engine using saturated steam. In tests carried out with goods engines the coal saving has been from 14.3 per cent to 18 per cent.

Piston valves are in this country used almost exclusively in locomotives using superheated steam. These have to be of special design, owing to the greater fluidity of superheated steam and to the difficulty of efficiently lubricating any surface to which highly superheated steam has access and which has a heavily loaded machine part passing over it. For the same reasons special attention has to be paid to the design of the piston head.

Steel Sleepers for India.

THE Secretary of State for India is now inviting tenders in England for the supply of steel sleepers, which indicates that the age of the steel sleeper is commencing in India. For some time past the price of wooden sleepers has been advancing with alarming rapidity, and even at the enhanced prices the railways have great difficulty in fulfilling their requirements of sleepers. The Forest Department of Burma, it appears, has supplied large quantities of pyngadu sleepers, but the price for these rose so rapidly that the railways had to look to other sources for their requirements, and large quantities of sleepers of the kind called Jharrah were imported into India for supply to railways. The price of these is also steadily rising. Deodar, sal, and other kinds of timber are also used for sleepers, but the demand is greatly in excess of the supply, and they are readily bought up as soon as they come on the market.

Forced Employment of Superfluous Men.

ONE of the unfavorable features in the railway situation is the forced employment of superfluous men. This fact should not be confused with that of wage advances. Wage advances are not an unmixed evil; superfluous men on railways are. Demoralization, with resultant poorer service to the public, form the evil of idlers, especially in railways, is an obvious fact.

"The public is hurt when non-essential men are kept on, and essential men, necessary for the better conduct of the business, are laid off. This is unfair at the start, and will in the end lower the efficiency of railways. Pressure of public opinion, exerted through its chosen representatives, presents the only way in which it can be remedied."—T. D. Underwood, President, Erie R. R.

Financial

The Outlook.

MARCH showed no well defined trend in either the business or the financial situation, although the latest railway returns have naturally given cause for the gravest apprehension. Net results, in a great many cases, are so unsatisfactory, that unless a sharp turn for the better occurs, a number of important roads will soon be in serious financial difficulties. Figures compiled by the Bureau of Railway News and Statistics for the six months ending December 31, 1913, show that while the gross returns from business done during this period were $10,000,000 greater than for the corresponding six months of the previous fiscal year, expenses increased $68,000,000 causing a loss in net operating revenues for the first half of the current fiscal year of $58,000,000. Later figures by the Bureau of Railway Economics for the month of January of the present calendar year, which we publish elsewhere, show even a worse state of affairs.

Under such conditions, the forthcoming decision of the Interstate Commerce Commission with reference to the proposed increase of five per cent in Eastern Territory is of paramount importance. Should this decision prove favorable, it is anticipated that it will at once stimulate railroad buying, and will have an encouraging effect upon general business. Even the most radical of legislators now recognizes the fact that the situation has become extremely serious, and the pendulum of public opinion is at last swinging definitely in the direction of fair play for the carriers and the imperative necessity of not delaying a decision in the rate case longer. There also appears to be a gleam of hope, a growing appreciation on the part of our citizens as to how closely our business future is dependent upon the prosperity of the railways. It would be foolish, however, to overlook the fact that the railroads have been severely crippled by the dilatory tactics of regulative authorities and that whatever action may be taken by the Commission, it will mean a long, hard pull before normal conditions can be restored.

The financial markets during March showed a noticeable absence of anything approaching liquidation, although the general tenor of public opinion seemed to be in the direction of awaiting some definite action in the political and business situation before undertaking anything of importance in the way of commitments. While general business continued under approximately the same scale as in January and February, practically all transactions were marked by a feeling of hesitation and insecurity which made hand to mouth buying the prevailing method of transactions for the month.

At Washington, the boiling point has about been reached, owing to the Mexican and Panama Canal toll questions. President Wilson has won the initial battle for the repudiation of the plank of the Democratic platform which called for the free passage of American vessels through that waterway, but the end is not yet, and lively times may be confidently anticipated for the next few weeks. The Mexican situation drags along in a most deplorable and discouraging manner and the President is being freely criticised for his lack of definite action. This, of course, adds to the unfavorable influences which are affecting business. On the other hand, fundamental conditions are not without their offer of better times to come. The mild winter and early spring give promise of bountiful crops and the country's tremendous natural resources are only waiting for that stimulus, which accompanies a feeling of restored confidence, to again flow, in gigantic volume, into the markets of the world.

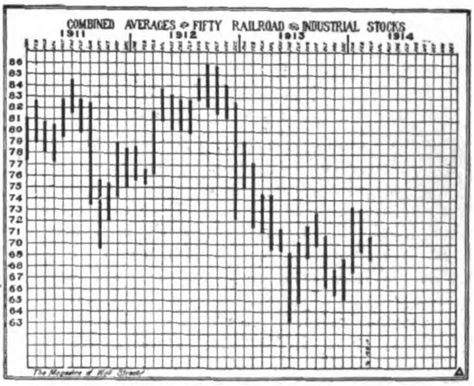
It is this lack of confidence, caused by the apparent inability of those in authority to deal with the great business enterprises of the country on a business basis, that is responsible for the present stagnation and uncertainty. It should not be overlooked, however, that the consuming public have been buying very sparingly within recent months and that economy has been the watch-word in practically every section of the Nation. Money is in abundant supply and it would appear that even a partial restoration of confidence in the ability of the authorities at Washington to deal with business in an intelligent and fair manner, should have an immediate and stimulating effect.

Spencer, Trask and Company, in discussing in their monthly letter the present condition of the security markets and the probable outlook, has the following in part to say:

"The situation in the security markets has been somewhat perplexing, but, generally speaking, the trend has been, with few exceptions, in an upward direction. Specific instances like the Rock Island situation, the heavy assessment upon the stock of the Wabash Railroad Company incident to its re-organization, and the prospect of suspension of dividends by other railroad corporations, have had their effect primarily on the securities directly affected, but the more seasoned and better grade of railroad stocks have held the improvement previously made during the year, and there has been little or no selling pressure from any quarter whatsoever. New offerings of securities have been of less volume than anticipated, largely because of the feeling that it was not wise to put them out under existing conditions, and the relatively small amounts issued, if made by corporations of standing and prominence, have met, as a usual thing, with comparatively ready sale. There is an abundance of money awaiting investment in the country, and while at the present time it is being used in the direction of high grade and seasoned securities, it undoubtedly would be available in larger quantities for new securities if assurance of a definite trend in the way of improvement could once be indicated.

"The bond market has shown little or no change from the previous month, with the exception that some new issues have not maintained the advance previously made. The floating supply of old line bonds has been very materially reduced, and the attention of conservative investors has necessarily been diverted to some extent at least, in the direction of public service corporation issues of seasoned standing and unquestioned earning capacity. The demand for municipal bonds has been of less volume than during the first two months of the year, largely because of the fact that the requirements incident to the Federal Income Tax Law have been very largely met; at the same time the present selling prices show such a small income return as to warrant investors in disregarding the income tax feature and reinvesting in securities that do not possess this element of investment attractiveness.

"The prospects for the immediate future, therefore, are contingent largely upon the consummation of factors previously referred to, particularly the final disposition of the railroad rate cases. Until something definite of this kind is indicated, there would seem to be little, if any, probability of a marked change in any direction. Given, however, a favorable and immediate decision on the rate question, security markets and general business may confidently be expected to change rapidly for the better."



Railway Revenues and Expenses for January.

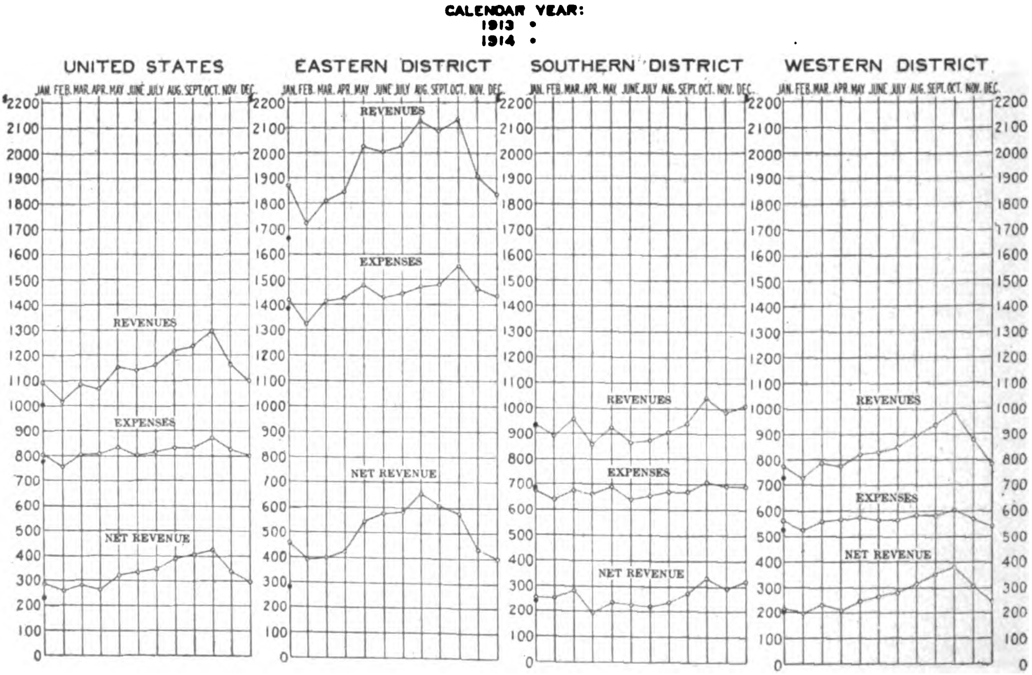
THE latest Bulletin of the Bureau of Railway Economics of Washington, D. C., shows a decrease in total operating revenues for January, 1914, as compared with the same month in 1913, of 7.5 per cent per mile, and a decrease in operating expenses of 3.3 per cent per mile. Net operating revenue per mile was less by $56 or 19.5 per cent than for January, 1913, while that for January, 1913, was 40 per cent greater than for January, 1912.

Railways operating 225,510 miles of line are covered by this summary, or about 90 per cent of all steam railway mileage in the United States. Their operating revenues for the month of January, 1914, amounted to $226,618,120. This amount includes revenues from freight and passenger traffic, from carrying mail and express, and from miscellaneous sources connected with rail operation. Compared with January, 1913, total operating revenues show a decrease of $16,457,067. Total operating revenues per mile of line averaged $1,005 in January, 1914, and $1,087 in January, 1913, a decrease of $82, or 7.5 per cent. There were decreases of 9.9 per cent in freight revenue per mile and of 1.2 per cent in passenger revenue per mile.

Operating expenses, which include all the costs of maintaining track and equipment, operating trains, securing traffic, and of administration, amounted to $175,067,091. This was $4,464,388 less than for January, 1913. These operating

MONTHLY REVENUES AND EXPENSES PER MILE OF LINE

ROADS HAVING ANNUAL OPERATING REVENUES OF $1,000,000 OR OVER



The points on the vertical lines are of significance only in showing the condition for the particular month. The lines connecting the points assist in tracing the change from month to month but do not indicate the trend during the month, nor are they cumulative for the period.

expenses per mile of line averaged $776 in January, 1914, and $803 in January, 1913, a decrease of $26 per mile, or 3.3 per cent.

Net operating revenue, that is, total operating revenues less operating expenses, amounted to $51,551,029, which was $11,992,679 less than for January, 1913. Net operating revenue per mile of line averaged $229 in January, 1914, and $284 in January, 1913, a decrease of $56 per mile, or 19.5 per cent.

Taxes for the month of January amounted to $11,178,828 or $50 per mile, an increase of 10.2 per cent over January, 1913.

Operating income, which is net revenue from rail and auxiliary operations, less taxes, averaged $177 per mile of line and in January, 1913, $238, thus decreasing $61, or 25.6 per cent. Operating income for each mile of line for each day in January averaged $5.71 and for January, 1913, $7.61. Operating income is that proportion of their operating receipts which remains available to the railways for rentals, interest on bonds, appropriations for betterments, improvements, new construction, and for dividends.

The operating ratio for January, that is, the per cent of total operating revenues absorbed in operating expenses, was 77.3 per cent, which is comparable with 73.9 per cent in January, 1913, and 78.2 per cent in January, 1912.

Colorado and Southern Passes Dividend on Preferred Stock.

THE Colorado and Southern Railway Company has been forced, owing to unsatisfactory financial results, to pass the dividend on its preferred stock, due April 1, 1914. In taking this action, the following letter has been addressed to the holders of this stock:

March 30th, 1914.

To the Preferred Stockholders:

It is with great regret that the management of the Company is compelled to announce to the holders of its Preferred Stock, that its financial condition will not justify the payment of a dividend on April 1st, 1914.

This condition has been brought about by the strike of the Colorado coal miners declared in the early Fall of 1913 and the serious shortage in the cotton and other crops on the Texas lines of the Company.

Every effort has been made to restrict operating and maintenance expenses as far as prudence would permit, but as a result of these conditions the operating income of the Colorado and Southern Railway Company for the seven months ended January 31st, 1914, shows a decrease of $432,908 as compared with the previous year, and a corresponding reduction of $915,266 in the operating income of the Colorado and Southern System Lines for the same period.

The revival of general business in the territory served by the Colorado and Southern will depend largely upon the outcome of the next crop season.

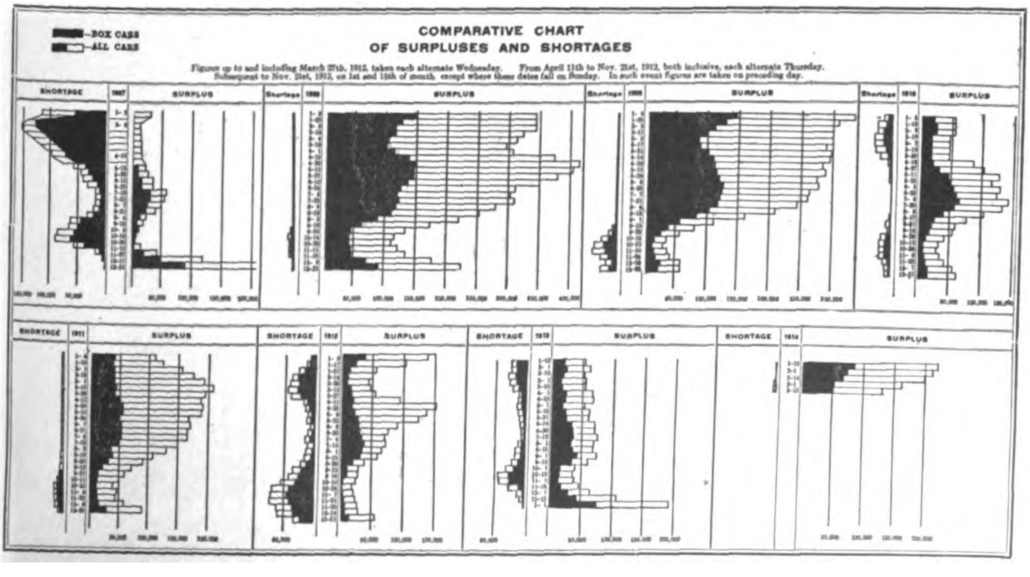
In view of this serious shortage in revenue and the uncertain prospects for the immediate future, we think the stockholders will agree that it would be unwise for the Company to make any dividend payments at this time.

The Colorado & Southern Railway Co.,
By Darius Miller,
President.

Operation

Statement of Car Surplusses and Shortages.

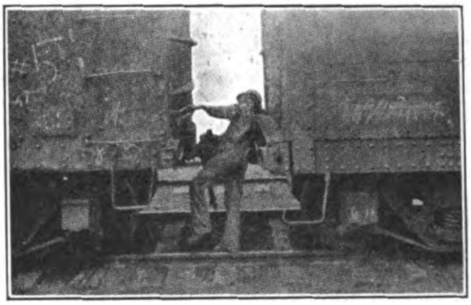
THE latest report of the American Railway Association on the car situation continues to show a large increase in the number of idle cars over the number on a corresponding date last year. The total surplus on March 15, 1914, was 132,010 cars compared with 57,998 on March 15, 1913. The shortages on similar dates were 7,145 on March 15th of the current year and



20,223 on March 10th of last year. The following diagram shows the surplusses and shortages on specified monthly dates for a series of years.

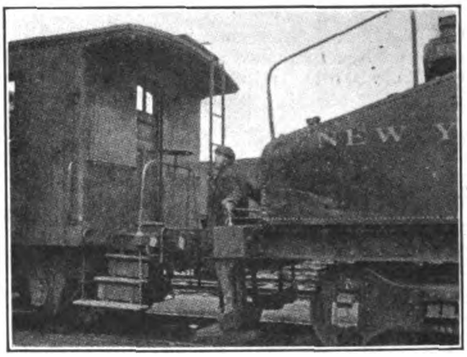
New York Central Safety Exhibit.

THE accompanying photograph gives some idea of the elaborate exhibit of the New York Central Lines on the occasion of the recent International Exposition of Safety and Sanitation held at the Grand Central Palace, New York City, in December. This exhibit occupied 416 square feet of space. A frame one foot wide and twenty-five feet in length contained thirty-four illuminated transparencies of scenes along the New York Central Lines. These were made by Japanese hand-colored artists and the coloring was of unusual beauty and richness. On a table just underneath them, was a most complete set of models showing safety guards as applied to machines. These little models were perfectly constructed and formed a most instructive exhibit. On the east side of the booth was a table containing pictures of unsafe practices and showing the safe and unsafe way of performing work by railroad men. On the same table were a number of pictures illustrating the trespass evil and pointing out graphically the class of trespassers most commonly found on railroads. Another table contained a neatly contrived stand holding illuminated lantern slides which illustrated unsafe practices used by the Safety Department for the education of employes. On a shelf above the beautiful transparent views, was a model of a New York Central Line box car equipped with all the proper safety appliances. This exhibit, taken as a whole, was considered so artistic, complete and instructive, as to merit a grand prize, which was accordingly awarded by the Exposition officers.



INDULGING IN THIS PRACTICE HAS COST HUNDREDS OF LIVES.

The February issue of the New York Central Lines' little safety magazine calls attention to the fact that that issue represents the first anniversary of the publication of the magazine which has appeared quarterly during the past year. There are 80,000 copies printed each issue and distributed to



A NUMBER OF MEN HAVE BEEN KILLED RIDING ON THE FOOT BOARD OF AN ENGINE WHEN A HARD COUPLING SHOVED THE DRAW HEADS IN.

the New York Central Lines English speaking employes. It has been the object of the editor to keep within its covers, pictures and reading matter of educational value to the men of all branches of the railway service. An effort has been made to point out plainly many of the causes of accidents that result in injury to employes of the railroad companies and others on their premises.

The current issue contains, as usual, a number of photographs illustrating how chances are being taken which often result in fatal accidents. The accompanying illustrations are fair examples of those which appear in the February issue.

Passenger Accidents Through Personal Negligence.

IT would be surprising to many individuals who have inaccurately reached the conclusion that whenever a passenger is injured or killed, the fault must rest with the railroad, to learn how many accidents occur to passengers which are entirely the result of their own carelessness. For example, seven hundred and twenty-one accidents to passengers of this kind occurred on the enn-sylvania Railroad last year, due entirely either to the carelessness of the passengers themselves or to a disregard of the rules of the company. As showing the great care with which railway operations are conducted, it is a highly significant fact that while no passengers were killed on the Pennsylvania Railroad in a train accident during 1913, seventeen were killed on the property of this company as a result of their own fault. Seven of these killed, either fell, jumped or stepped from moving trains, while four jumped from ferry boats. The other cases of death were due to the following causes: Attempting to board a moving train, jumping through coach window, stepping from train into canal feeder, stepping off station platform in front of train, being struck by train after alighting from another train, child and woman being struck by a train in an effort made by woman to rescue child who had started across tracks.

Passengers on trains have often objected to the requests of trainmen not to allow luggage to remain in the aisles of coaches, but the necessity for this rule is apparent when it is stated that the Pennsylvania Railroad alone last year, paid out $5,143 on account of accidents to passengers who tripped over other passenger's grips placed in the aisles.

Railroad Employes as Fire Fighters.

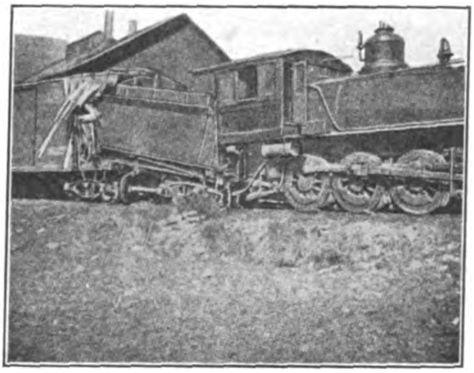
LAST year 823 fires occurred on the property of the Pennsylvania Railroad System; this was the smallest number of fires in a year since 1904. The fire loss for the year was $271,288, the smallest, with the exception of one year, in the past 35 years.

As showing a steady improvement in efficiency, in 1908 the company's employes extinguished 274 fires out of a total of 1,397 which occurred on railroad property.

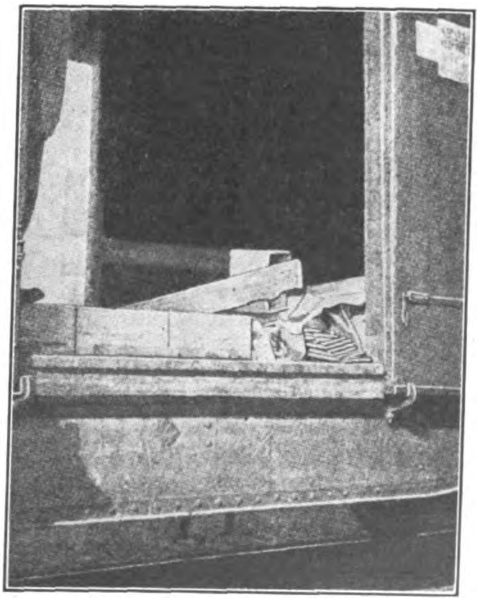
The railroad has issued a circular giving the causes of all fires on the System in 1913, in order that employes may realize that their efforts to minimize losses from fire are effective and are appreciated.

Report of the Chief Inspector of the Bureau of Explosives.

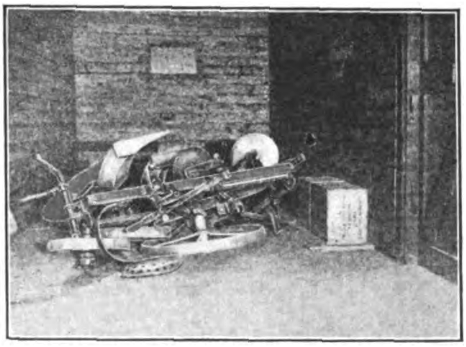
COLONEL W. B. DUNN, chief inspector of the Bureau of Explosives, has issued his report for the calendar year 1913. The report constitutes a thorough and comprehensive review of the work of this valuable organization during the past twelve months and contains a statistical record of all accidents which occurred during the year rightfully coming under the jurisdiction of the Bureau, including the property loss involved and the number of persons injured and killed. In the transportation of articles named in the list of dangerous articles, the report shows that there were two hundred and sixteen accidents, representing a property loss of $5,282, accompanied by the injury of twenty persons and the death of one. The fires which occurred in the transportation of articles named in the list of



A NARROW ESCAPE. THIS CAR OF EXPLOSIVES WAS BEING HANDLED NEXT TO ENGINE IN VIOLATION OF THE INTERSTATE COMMERCE COMMISSION'S REGULATIONS.



A "NEAR ACCIDENT" TO CAR CONTAINING 23,000 POUNDS OF HIGH EXPLOSIVES. CONDITION DISCLOSED, CAUSED BY ROUGH HANDLING.



A Gang Plow Loaded Near Two Boxes of High Explosives. The Conditions are Favorable for an Explosion and the Position of the Boxes in Direct Violation of the Interstate Commerce Commission's Regulation.

dangerous articles involved a property loss of $276,000, and injury to sixteen persons. The accidents in the transportation of explosives resulting either in explosion or fires involved a property loss of $22,000 and caused the injury of four persons.

In discussing the results of the year's work, Colonel Dunn has the following in part to say:

"When this work was started in 1907 the only object in view was to promote safety in the transportation of explosives. Safety in the transportation of dangerous articles other than explosives was not considered at that time. In the year 1907, 79 accidents occurred in connection with shipments of explosives in transit and on carriers' property awaiting delivery to consignees; 52 persons were killed and 80 injured as a result of these accidents. The total property loss reported was $496,820 and it is known that this did not include all losses, since many suits for damages were unsettled at the time the reports were rendered.

"During the year 1913 no life was lost and only 4 slight personal injuries occurred in connection with the transportation of explosives by railway common carriers in the United States and Canada. The total property loss was $22,048.50. Of this total it is proper to consider $4,048.50 as the actual loss resulting from violation of the regulations properly chargeable to shippers and carriers. An item of $18,000 in the total loss was caused by an explosion and fire which our investigation indicates was due to the criminal act of a railway employe, whose object was to collect an accident insurance policy.

"Of the 4 persons slightly injured 3 were injured by the explosion of small quantities of black powder or small arms ammunition concealed by shippers in baggage or household goods. The remaining injury was received while fighting a fire that reached a car containing a shipment of 32 cases of dynamite, and resulted in the explosion of this material.

"The most serious accident for which carelessness of the carrier can be charged is that of the explosion of 32 cases of dynamite in a car which was stored in a yard in such a position as to be subject to fire risk. The negligence in this case was indirect, however, since the fire was caused by live sparks blown by a high wind into a pile of lumber which happened to be near the car.

"It cannot be denied that the work of this Bureau is a prime factor in the enforcement of the regulations and that to the degree of enforcement attained is due the difference in loss of life and property, between the records cited for the years 1907 and 1913."

Growth of Sanitation on Northwestern System.

SOMEWHAT over a year ago the Chicago and North-Western inaugurated a system of sanitation inspection on its lines under the supervision of Dr. C. G. Elmore. At the start, Dr. Elmore confined his efforts to the inspection of equipment arriving at and leaving from the new passenger terminal at Chicago. His field has been so rapidly enlarged, however, that to-day the Chicago Passenger Terminal itself as well as all parlor cars, buffet cars, dining cars, chair cars, coaches, baggage cars, station and employes' quarters, and such places as round houses, shops, etc., over the entire system, come under his direct supervision. In this work Dr. Elmore has the co-

Inspecting Fish Racks and Dining Car Kitchens on Chicago North Western Road.

operation of the vast army of Chicago and North-Western employes, who are making it their duty to report any unsatisfactory conditions they find in their particular localities.

As an indication of the magnitude of this work, it is of interest to state that 325 cars are cleaned and inspected at the California Avenue yards in Chicago each day and about 250 similarly treated at the Erie Street yards in the same city. The coach yards at Milwaukee and Council Bluffs also handle large numbers, while the cleaning done at other points on the system swells the total considerably. No details are too small to escape attention, as, for example, the corners of window sills are given extra cleaning, dining cars are inspected, while on their regular runs for the refrigeration of milk and vegetables and for the handling of butter, cheese, etc. Fish racks and baggage cars are kept thoroughly cleaned with cleanser and deodorant. Milk loading stations are watched to see that no milk is left on the station to attract flies or other germ bearing insects.

A card system has been installed in the principal coach yards by which a car inspector can tell at a glance whether or not the thorough cleaning demanded has been performed. If he finds any part of the work unsatisfactory, the responsible employe is instructed to go over it, thus insuring a maximum of cleanliness before going into service.

Observance of Rules on the Pennsylvania.

TO test the general observance of rules on the Pennsylvania Railroad, 5,961,732 observations were made and reported in 1913, with 8,120 failures, showing a record of 99.9 per cent perfect. These tests included a great variety of violations, from employes reporting late to smoking on duty, using locomotive whistle unnecessarily, leaving headlight burning in daytime, using foot to adjust couplers, going between cars to repair leak in air brake hose without notifying train crew, placing torpedoes where persons are liable to be injured by them, and the use of reliable watches. In all, 93 different kinds of observations were made. Exactly 784,675 observations were made as to the use of intoxicants by employes, and only 158 cases required discipline.

Track Inspection on the Southern Railway.

DETAILS of the methods by which every rail in the Southern Railway's 7,036 miles of track is annually subjected to the closest inspection are given in the March issue of the *Southern News Bulletin* in an article telling of the steps which the Southern has taken to prevent derailments resulting from broken rails.

The system of inspection which was adopted over two years ago is believed the most rigid and effective possible. The work is under the direction of the district engineers and division roadmasters and is done by the track supervisors and section foremen who closely scrutinize each and every rail while on their hands and knees and with eyes close enough to the rail to detect the slightest discoverable tendency toward weakness or failure and wherever such are found the rail is immediately removed. Detailed reports are made on each rail left in the track so that comparison can be made at the next year's inspection.

Presentation of Harriman Medals for Safety Work.

THE presentation of the E. H. Harriman Memorial Medals to the Southern Pacific Railroad for safety work by the American Museum of Safety, took place in New York on the evening of March 14th. Two of the medals went to the officials of the road, Mr. Julius Kruttschnitt, chairman of the executive committee, and Mr. William Sproule, president of the company, while the third was presented to an employe, Mr. William Schwab, a conductor on the Sacramento division, whose practical suggestions for safeguarding life and limb have been of value to the road.

This is the first award of the Harriman medals which were donated by Mrs. E. H. Harriman to stimulate a direct effort for the conservation of human life and to be awarded annually to the American steam railroad making the best record in accident prevention and industrial hygiene affecting the public and its own employes. The announcement that the first award would be to the Southern Pacific was made at the annual meeting of the Museum of Safety in December, 1913.

The awards were made in the studio of A. A. Anderson and the medal was accepted on behalf of the company by Chairman Julius Kruttschnitt, who, after paying a tribute to the late E. H. Harriman's genius, said:

"Team work and co-operation were Mr. Harriman's watchword and his wonderful success was in a great measure due to the faith in the meaning of the words with which he inspired his officers and men. I believe the high degree of safety in train operation attained by men of the Southern Pacific was made possible only by loyal and perfect co-operation following Mr. Harriman's ardently advocated policy of working together. In the year 1913, the company's locomotives in freight, passenger and work service, ran for a distance of 59,738,000 miles, a figure too large to convey any meaning. At this rate since last Saturday night the miles ran would girdle the earth forty-six times, or nearly seven times in one day, or once in three and one half hours. With so great a movement liability to accident is very great, yet 41,783,000 passengers were carried the inconceivably great distance of 1,756,482,000 miles, and this was done without fatality in train accident. Furthermore, it was done for the four years preceding with the same immunity. Among the forty-five thousand men engaged in pursuits not involving train movement there was one fatality in every 876,400 days or 2,400 years worked."

Chairman Kruttschnitt then paid a tribute to Mrs. Harrriman, who provided the medal, and President Sproule was given the silver replica. He said in part:

"In receiving the medal which the American Museum of Safety has seen fit to bestow on me, I do so with a keen sense of the representative relation I bear to the Southern Pacific Company. I fully realize and recognize how little could be attained in the high degree of safety achieving in the company's operations were it not for the loyalty and efficiency of the officers and staff and the men on the line, in every grade of the service.

"With a body of men imbued with the loyalty that makes for efficiency and imbued with the knowledge that efficiency cannot be had without discipline, great things may be done. I believe our winning of the medal is because of the loyalty, efficiency and discipline of all the company's forces in all the branches of the service which contribute to the safety of the passenger and so in accepting for myself this silver replica of the medal I desire to couple with it an expression of my appreciation of these high qualities in the officers associated with me and in my fellow employes throughout the service. The formal and nation wide recognition of safety as an imperious factor in railroad operation stimulates us to make further and persistent and intelligent effort to maintain the record of the past and to improve upon it. I desire also to express my personal gratification that the gracious lady who has given these medals in memorial of her husband under whom I served finds that the Museum's first bestowal of the medal is upon one of the Harriman lines."

Conductor Schwab said that close observation of conditions and practices of employes and the traveling public bring to any employe interested in safety work, many things that can be remedied. He said that employes are realizing more and more that the better protetcion of the traveling public means also added protection of their own lives and the happiness of their families. In referring to the company's efficiency tests he said that they have come to be a great factor in the prevention of accidents and that the elimination of excessive speed of trains with the fact that trainmen are not criticised for failure to make up lost time when the effort would endanger life and property and the close observance of the rules of the operating department have done much to establish the safety record.

The affair was attended by several hundred people. The Anderson studio was placed at the service of the Museum, making the scene of the presentation as unique and interesting in its character as was the occasion itself.

Queen and Crescent Route to Experiment with Automatic Train Stops.

A THOROUGH test of the automatic train stop is to be made by the Cincinnati, New Orleans and Texas Pacific Railway Company (Queen and Crescent Route) which has arranged to conduct a series of experiments to determine the value of this device in train service under practical operating conditions. The advocates of the automatic train stop have made very extensive claims as to its efficiency in preventing accidents, the most important of which is that it will automatically bring to a stop any train whose engineer has overlooked or misread a danger or caution signal, thus eliminating danger resulting from mistakes on the part of employes. The experiments to be conducted by the Cincinnati, New Orleans and Texas Pacific are for the purpose of determining to what extent these claims will be borne out by the results obtained in actual practice on a busy railway.

The first device to be tested was the Julian Automatic Cab Signal and Train Control, the test being made at Ludlow, Ky., on March 28th. This will be referred to in greater detail in a future issue of the RAILWAY WORLD.

Police Department Report of the Cincinnati, Hamilton and Dayton.

THE police department report of the Cincinnati, Hamilton and Dayton Railroad, as submitted to General Manager J. M. Davis, covering 1913 shows that 518 persons were arrested for crimes committed against the railroad and while on the railroad property. Of these, there were but four dismissals by the courts.

The report covered all classes of crimes. There were 228 cases of petty larceny, 66 for burglary and 170 for riding unlawfully on trains.

On the Toledo division 453 arrests were made, 57 on the Indianapolis division and 8 on the Wellston division. The total is an increase of 110 arrests as compared with 1912.

In commenting upon the report of the police department, Chief Special Agent Woodward sums up the criminal situation when he says:

"The increase in robberies was caused by the flood of 1912, which threw thousands of men out of work in the territory and brought thousands of thugs and thieves into the stricken district under the guise of laborers. These laborers took advantage of every opportunity to steal in the various communities and the railroads were the particular prey of this criminal class.

"The leniency of the courts also made it difficult to protect the railroad and its patrons."

"Rolling" One Hundred Thousand People an Hour.

ONE of the most unique and original methods of transportation ever devised for handling exposition crowds, and one which will effectually solve the problem of transporting the enormous crowds from the ferry building to the exposition grounds, is planned for San Francisco during the Panama-Pacific International Exposition next year.

The new method known as the roller conveyor system is similar to that which has been in use in factories for years, although this will be the first application of the mechanism to passenger traffic.

The cars will operate upon an elevated trestle having a fall of three feet to every hundred, and along which rollers are placed at intervals of a few feet, allowing the cars to coast easily. At intervals of four hundred feet the car will be lifted by a cable up a steep declivity to a height of twelve feet above the lowest point of the trestle track, and will then coast to the next similar station.

The entire system will cost only $350,000 and the expense of maintenance will be slight. Twenty motor stations will be necessary to operate the cables but each will require a smaller motor than that used on an ordinary street car.

A sight that never fails to amaze visitors to the Panama-Pacific International Exposition grounds is that of a train of freight cars speeding out of a nearly-finished exhibit palace. While all the entrances are large enough to admit locomotives and cars, the proportions of the immense buildings are such that the spectator does not realize this. Spurs of the exposition terminal railway system enter all the palaces and are now in daily use transporting lumber and materials for construction to the interior of the edifices. Later these tracks will be used in the installation of exhibits. When the exposition opens every track will be covered over, and will remain invisible until the close of the celebration, when they will again be used.

The accompanying artist's drawing has been distributed by the Panama-Pacific International Exposition Company as indicating the general appearance of the exposition grounds, after completion of the vast enterprises now under way. The exhibits will be grouped in eleven departments, as follows:

Department A, Fine Arts.
Department B, Education.
Department C, Social Economy.
Department D, Liberal Arts.
Department E, Manufactures and Varied Industries.
Department F, Machinery.
Department G, Transportation.
Department H, Agriculture.
Department I, Livestock.
Department K, Horticulture.
Department L, Mines and Metallurgy.

The combined area will amount to 3,731,000 square feet. A horticultural display of fifty acres, twelve acres of railroad and other outdoor exhibits, a drill and aviation field of fifty acres, State buildings covering forty acres and foreign buildings covering thirty-seven acres will be some of the features.

Aiming to prevent accidents at the crossings of its tracks in the cities and towns and on the highways, the Baltimore and Ohio management has issued a comprehensive code of rules to watchmen, clearly defining the duties of such employes and urging every precaution in the interest of public safety.

Under the new regulations the watchmen report to the track supervisors and are required to undergo an examination as to operating rules, signals and schedules. Daily inspections of the crossings are included in the work of the watchmen and miscellaneous repairs are to be made by the employe on the ground.

The crossing watchmen are provided with a white and a red flag, to be used in daylight; and between sunset and sunrise lanterns are used in signaling. A flag or lantern held at arm's length is a stop indication, and when the tracks are clear the flag or lantern is raised in a vertical position.

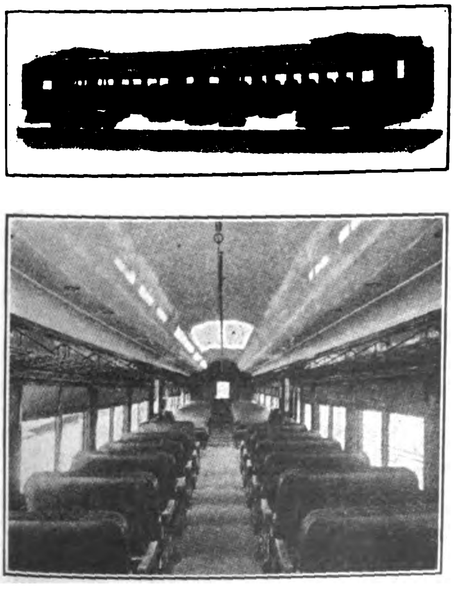
The watchmen are furnished uniform caps, with their occupation displayed on a metallic plate, to identify them before the public.

Mechanical

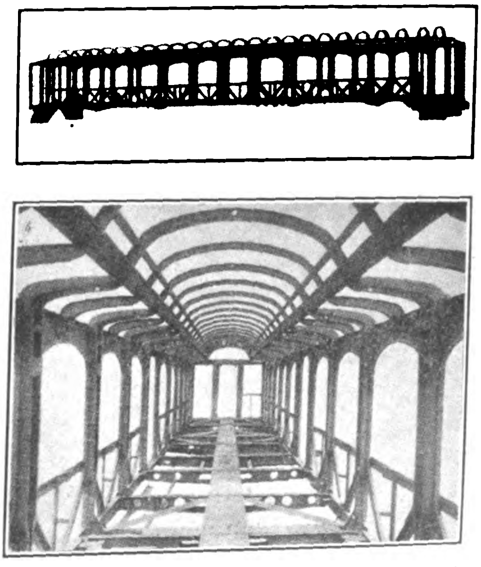
Steel Passenger Cars.

AT the February meeting of the New England Railway Club, the members listened to an instructive talk on "Steel Passenger Car Construction," by Mr. F. M. Brinckerhoff, of New York City. After dealing, in a comprehensive manner, with the general design of steel passenger cars from the standpoint of safety and comforts to passengers, low cost of operation, low cost of maintenance and moderate first cost, Mr. Brinkerhoff closed his discussion by describing, with the use of illustrations, the full vestibule, steel suburban passenger cars, operated on the New York, Westchester and Boston Railway.

These cars are 61 feet body length, 72 feet overall, seat 78 passengers and are equipped with electric motive power apparatus capable of maintaining a schedule speed of thirty miles per hour, making station stops approximately one mile apart. Each car weighs complete 119,500 pounds and Mr. Brinckerhoff stated that designs have recently been prepared of a similar car for operation on steam railway service. This latter car will be arranged for 86 seated passengers, the middle side door being omitted, and will weigh complete about 85,000 pounds, exclusive of storage battery or axle driven generator for lighting, but including all other necessary fixtures. This car will weigh about 15,000 pounds less and will accommodate fourteen more passengers



Exterior and Interior View of Full Vestibuled All Steel Cars on the New York, Westchester and Boston.



Showing Frame Work and Method of Construction of All Steel Cars of the New York, Westchester and Boston Road.

than the corresponding type of wooden car now in service on the road for which they are designed.

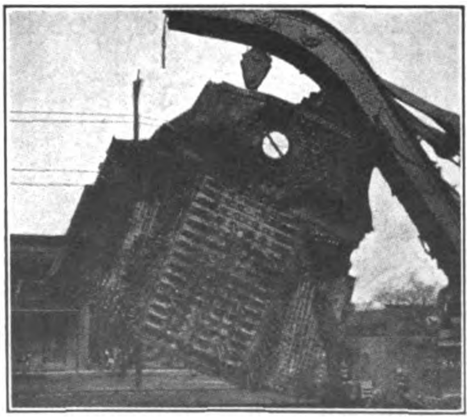
The following illustrations give an excellent idea of the cars employed on the New York, Westchester and Boston. It will be noted that the interior view shows several new features in steel car construction, notably the arched roof with light colored finish giving high reflecting value to the electric lamps. The car is fitted with two systems of lighting, the principal illumination coming from the lamps arranged along the side of the car, which are in service as long as the motive power remains on the car, and the second lighting circuit, being fed from the storage batteries, and being used only during such periods as the motive power is temporarily cut off from the car.

The construction views herewith presented are of particular interest. As indicated, the side plate is virtually a pressed channel continuous throughout the length of the car body, in one piece, and with side piers which are ten-inch pressed channel formation of one-fourth inch steel. At the side sill of the car is a seven-inch rolled steel channel to which all the side frame piers and posts are securely riveted. The use of a cross-bearer at each of the main piers of the side frame, securely supports the center sill construction against dislocation either upward or downward, and the diagonal braces in the underframe secure the integrity of the center sills against dislocation in a horizontal plane. This type of construction relieves the center sill from any vertical load and thus leaves its entire section available for resistance to impact shocks.

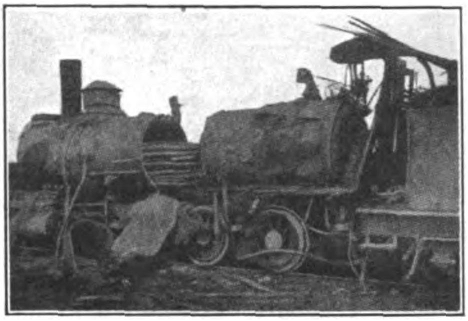
The great strength of the combined arch type of roof is manifest in this illustration. The roof sheets are in one piece from side plate to side plate, double lapped across the wide carlines, and are rivetted to their upper flanges. This form of roof Mr. Brinkerhoff asserted is about 1,500 pounds lighter than a monitor deck roof and is notably stronger and cheaper to construct on account of having fewer joints.

Results of Locomotive Boiler Inspection Law.

AT its December meeting the Western Railway Club was addressed by Mr. Frank McManamy, chief inspector of the division of locomotive boiler inspection of the Interstate Commerce Commission, on the Locomotive Boiler Inspection Law. Mr. McManamy pointed out that while the enforcement of such a comprehensive law has not been effected without some friction and opposition, and while to a measure, it has proved costly and has led to the sacrificing of certain ideas and practices, the fact is now generally admitted that the law on the whole, has proved beneficial to the carriers.



This Wrapper Sheet, Dome and Portion of Mud Ring Weighing Approximately 1600 Pounds, was Blown 1200 Feet in the Opposite Direction from the Back Head on Account of Explosion Due to Excessive Pressure.



Explosion Due to Defective Dome Owing to Flaw in Casting.

He asserted that the practice of conducting a rigid searching investigation of all accidents to locomotive boilers and their appurtenances sufficiently serious to justify a report, with the sole object in view of determining the exact cost and having the proper remedy applied, has done much to reduce the list of casualties which, during the fiscal year ended June 30, 1913, shows a reduction of over sixty per cent in the number killed and ten per cent in the number injured by failures of locomotive boilers and their appurtenances.

The following comparison of some of the most serious as well as some of the most frequent accidents during the first and last quarters of the fiscal year ended June 30, 1913, fairly represents the benefits which result from supervision over the condition of locomotive boilers and their appurtenances. It will be noted that for the six classes of accidents referred to which resulted in injury, ninety-five occurred in the first quarter and fifty-one during the last quarter.

	First Quarter			Last Quarter		
	Accidents.	Killed.	Injured.	Accidents.	Killed.	Injured.
Crown sheet failures	18	10	30	9	2	13
Flue failures	15	..	18	11	1	11
Injector steam pipe failures.	10	..	13	5	..	6
Arch tube failures	5	..	5	5	..	7
Water glasses bursting	36	..	36	16	..	16
Lubricator glasses bursting .	11	..	11	6	..	6

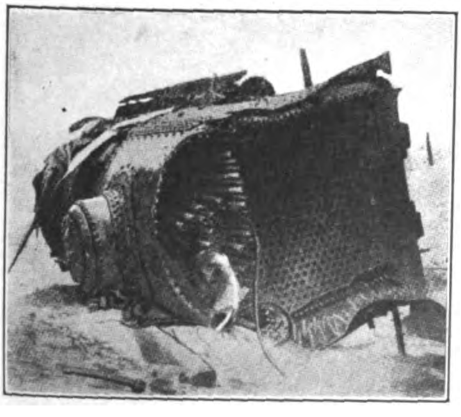
Mr. McManamy explained that perhaps a better illustration of the improvement which has been brought about, is that during the three months ended September 30, 1912, there were ninety-five accidents of the classes mentioned above with ten persons killed and one hundred and thirteen injured thereby, while during the six months ended September 30, 1913, there were ninety-four accidents with eight killed and one hundred and three injured thereby

While a very decided improvement on the whole is thus shown, it is pointed out that there are certain classes of accidents where, instead of an improvement, conditions appear to have grown worse. One illustration of this is in arch tube failures. An investigation shows that of twenty such failures, fifteen were caused by improper application or neglect, three were reported as defective and only one showed a clear rupture without evidence of improper application, neglect or defect in the tube

Tightening washout plugs under pressure is a practice that has also caused numerous accidents. These accidents are positively preventable and strict instructions should be issued and enforced never to put a wrench on a plug when there is pressure on the boiler. Another type of accidents which has shown an increase during the year is injector steam pipe failures. Out of a total of thirty-six accidents of this type, twenty-four of the failures occurred where the collar was brazed on the pipe and were due either to defective brazing or to the fact that the pipe or the collar was too thin at this point. The attention of injector manufacturers and locomotive builders has been called to this weak point and they are at the present time earnestly striving, through the efforts of a joint committee, to have adopted a connection which will remedy the trouble.

Another class of accidents in which there has not been an improvement is flue failures. During the year ended June 30, 1912, there were fifty-six failures which caused injury, and during the year ended June 30, 1913, there were fifty-four failures causing injury. In discussing this question, Mr. McManamy said, "The question of flue failures, although important in itself, has been mentioned principally because it leads up to what to me appears to be a more important question that should now be given serious consideration by the mechanical departments of the various railroads and by the departments of the Government with which I am connected, namely, shall superheater tubes be welded?"

"With the wonderful results claimed and in a measure obtained from superheaters, it appears to be a question of only a few years until practically all locomotives will use superheat. This will result in thousands of 5⅜-inch or 5½-inch superheater tubes being used where now there are hundreds. To the men on locomotives, the collapse or failure of one of these large tubes amounts to about the same as a crown sheet failure, because in either case, death or serious injury is almost certain. Therefore, if we are to have the same number of failures of superheater tubes due to welding that we now have with the smaller tubes, the injuries resulting therefrom will on account of the size of the tubes doubtless be so much more serious that in the interest of safety, action will have to be taken possibly even to the extent of prohibiting welds in such large tubes.



EXPLOSION DUE TO LOW WATER. GLASS WATER COCKS CLOSED SHORTLY BEFORE ACCIDENT TO MAKE REPAIRS. TOP COCK WAS PROBABLY NOT OPENED, AS IT WAS FOUND CLOSED AFTER EXPLOSION.

CONDITION OF FIRE BOX SHEET AS THE RESULT OF AN EXPLOSION CAUSED BY WATER FOAMING.

"Do not misunderstand me in this. I am not making a positive statement that welds in superheater tubes will be prohibited, but that it is a matter which is being closely watched, and what action may be necessary will depend on future developments, because a large percentage of such tubes now in service are comparatively new and have never been safe ended. Many shops where this work is being done are poorly equipped for handling it, adequate tests of welded tubes are in many instances not being made, and, as might be expected, there is a wide divergency of opinion as to the best method of doing such work. That the strength of a weld is practically an unknown quantity has been demonstrated times without number. The fact that a number are tested and found good is not an indication of what the next one will do, and, for this reason it is the generally recognized practice that where the highest degree of efficiency and reliability is required, welds are prohibited. It is the general practice not to permit the use of welded radials or other boiler stays. Almost all roads prohibit welding arch tubes, safety appliance standard prohibits the use of welded brake shafts, yet in none of these things is reliability more essential nor failure more disastrous than in superheater tubes."

The Application of Thermit in Locomotive and Shop Repairs.

AT the regular January meeting of the Railway Club of Pittsburgh the members were entertained with a joint address by W. R. Hulbert and H. D. Kelley, of the Goldschmidt Thermit Company, who talked on "Thermit and its latest development in railway shop practice."

Mr. Hulbert explained that the fact that aluminum is hard to separate from oxygen is taken advantage of in the thermit reaction, as the high affinity of aluminum for oxygen permits of a chemical reaction between the two when they are heated hot enough.

In making a thermit weld the parts to be united are first arranged with a space between them varying from one half inch to two thirds, depending upon the size of the sections. Where the

pieces to be welded are in two parts, it is a simple matter to provide the space, but in the case of the fracture, it is often necessary to cut out the metal by means of the oxy-acetylene cutting flame or by a slower process. Mr. Hulbert stated that in the case of welding locomotive frames, it was almost always necessary to cut out the fracture. Thermit, as he pointed out, is a mixture of aluminum and iron oxide which, when ignited, reacts. The aluminum combines with the oxygen of the iron oxide, while the iron is set free and comes down as a highly liquidated steel at a temperature of 50,000 Fahrenheit or about twice the temperature of ordinary molten steel. When this is poured around the sections to be united it will melt those sections and amalgamate with them so that the whole will cool down to form a single homogeneous mass.

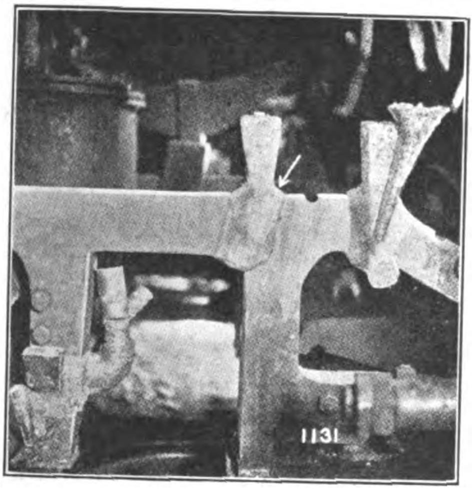
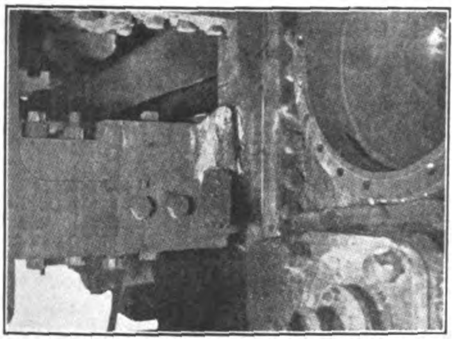
First picture shows link lined up previous to welding, and second picture, the finished welds previous to machining.



Difficult Welds on Frame of Engine of Chicago, Rock Island and Pacific.



Thermit Weld in Splice of Locomotive Frame Showing Weld Near Cylinder.

Dealing particularly with the welding of a locomotive frame, of which the following illustranecessary to jack the frame apart obout one-eighth to three sixteenths of an inch before putting on the mould in order to allow for the contions are examples, Mr. Hulbert stated that it was traction of the thermit steel with the metal when the weld cools. It was asserted that the great economy of the process in locomotive repair work has led to its adoption by practically all the railroads of consequence in the United States, Canada and Mexico, it now being employed on 421 different railroad shops in North America.

Mr. Hulbert stated that it is not only on locomotive frames that thermit finds extensive use in railroad shops, as it can be applied to equal advantage in the welding of broken driving wheel spokes, side rods, connecting rods, rocker shafts, cross head guides, cylinder saddles, mud rings and other broken sections too numerous to mention.

The Hancock Coal Sprinkler.

MOST accidents in a locomotive cab are due to the failure of the coal sprinkling apparatus. Water for sprinkling is usually taken from the delivery pipe of the injector, and the temperature is so high and the pressure so great that when the delivery hose becomes clogged, as it frequently does as a result of the heat and pressure destroying the inner lining, the hose either bursts or is blown off the connection scalding the occupants of the cab. Of all cab accidents, seventy per cent are said to come from this source.

The Hancock Sprinkler, which acts on the principle of an ejector, is so designed that it is absolutely proof against accidents of this kind.

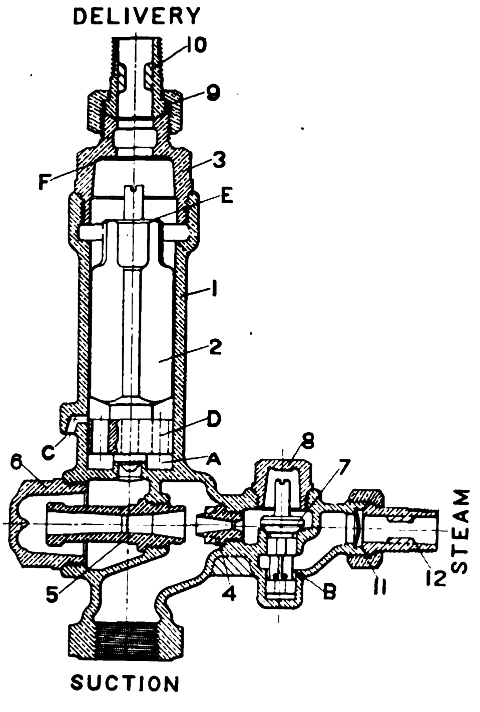
The principal feature of the Hancock Coal Sprinkler (made by the Hancock Inspirator Company, New York) is a valve which automatically discriminates between steam and water and its action is so positive and reliable that there cannot be a sudden and unexpected discharge of steam through the hose.

The sprinkler is generally applied on the strainer or on the suction pipe of the injector of the locomotive by the use of a short connecting nipple having a bend so that the sprinkler will be in a vertical position. A valve is placed in the steam pipe at a point where it can be conveniently reached.

In operating the coal sprinkler the steam valve in the pipe is opened wide and that action opens the Valve 7. That action also closes the drip hole B, the piston end on the lower end of guiding stem covering the hole. Steam will now flow through Nozzle No. 4, forming a jet and combining with water in Valve 5. (But there never will be a flow of steam in starting because tubes 4 and 5 are always under water by reason of the location of the sprinkler at a point lower than the tank.)

Steam will flow into the pressure chamber A and Valve 2, which has been closed heretofore, will be lifted. Port C, which has been opened heretofore, will also be closed and the water will be forced through the delivery pipe and into the delivery hose.

The accidents resulting from the use of a



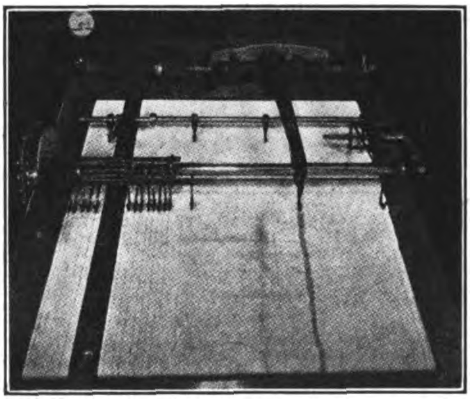
Detailed Drawing of Hancock Coal Sprinkler.

sprinkler, have generally been caused by an interruption of the water supply due to an obstruction such as leaves waste or coal at the strainer, or by the failure of the injector to work. Should the flow of water be interrupted or the injector refuse to work, where a Hancock Coal Sprinkler is used the valve No. 2 which discriminates between steam and water will close the sprinkler so that no steam will escape into the hose; instead the steam will be blown back toward the suction pipe, will flow into the pressure chamber A, and force Valve 2 upward.

The end E of valve 2 will seat against the surface F thus making it impossible for steam to flow into the delivery tube.

When not operating, both valves will seat. The discriminating Valve No. 2 is heavy enough to prevent water flowing up the delivery pipe and then all the water in the delivery pipe will flow out of the drain hole C. At the same time Steam Valve 7 will seat, no water will flow up the steam pipe and all water or steam in the steam pipe will drain out at the hole B.

This sprinkler uses comparatively cold water, no steam can escape, it is self-draining and can not freeze.



RECORDING TABLE OF DYNAMOMETER CAR.

The Erie's New Dynamometer Car.

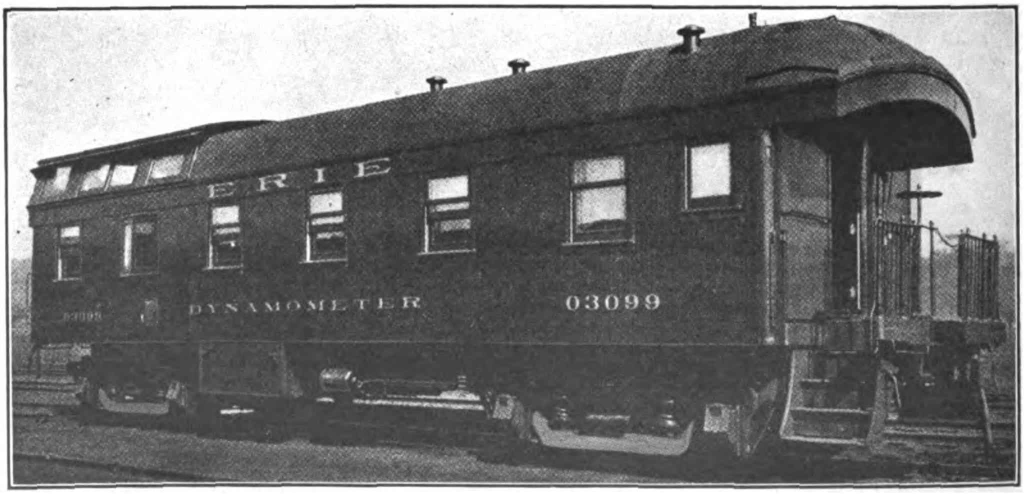
THE Erie Railroad, through its mechanical department, has recently placed in service a dynamometer car whose general appearance is indicated in the accompanying photograph. All but the recording table and the underframe was constructed in the Erie shops at Meadville. The dynamometer is of the liquid type with double pistons twenty inches in diameter, whose heads press against blind rubber caskets covering the liquid cylinders from one of which the pressure of the drawbar pull is registered, and from the other, the buffing. The car is provided with a possible pull or shock registering capacity of a million pounds, and also has the means of recording locomotive data while the engine is standing still. This is accomplished by means of a supplementary record which is four inches wide. When the car is at rest the roll is driven by a motor. Night running is accomplished by placing hoods for search lights at the floor level on either side of the car.

The Wright Stabilizing Machine.

THE one defect which has thus far kept the aeroplane from becoming a practical device for transportation purposes, has been its lack of stability. Aviation from the start was, and still remains, too dangerous a pasttime or business to become popularized in either direction.

The adherents and champions of this new method of transportation have long recognized this serious handicap, and many able minds have been directed towards its elimination, with but indifferent success. The most recent stabilizing device is offered by the father of aviation, Orville Wright, and if only on account of its origin, merits at least respectful attention. Whether his solution of the problem may prove to be the final one is a mooted question, but a writer in the "London Sphere" is of the opinion that it probably will, at least under certain restricted conditions. He writes:

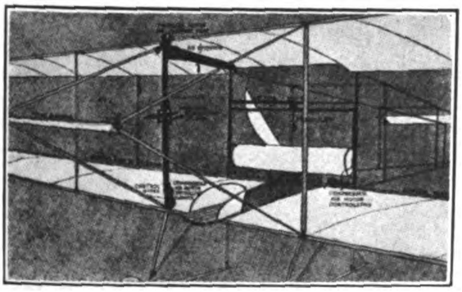
"Mr. Orville Wright, after making experiments extending over several years, has invented an automatic stabilizer for aeroplanes, so that for



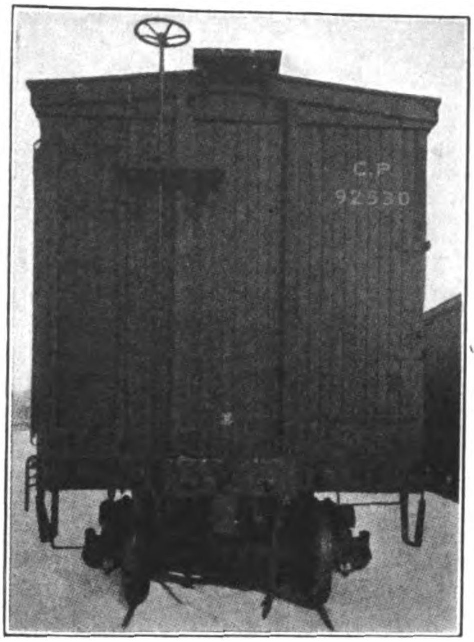
THE NEW DYNAMOMETER CAR OF THE ERIE RAILROAD.

a certain while the machine 'will fly itself.' The machine is to be 'fool-proof.' The apparatus is air-driven; in other words, a small propeller-driven air-pump compresses the air in the reservoir. This is carried by pipes attached to the struts through a check-valve. This valve is controlled by a vane which is actuated by the wind-pressure and so works the valve that controls the compress-air engine, which in turn works the elevator. To balance the machine, a pendulum controls the valve which is attached to the pipes to the air-engine that supplies the power to work the ailerons. Expert aviators who have been interviewed think that the device would be useful for long flights or for single-man scouting, when the pilot could leave the machine to look after itself while he spies out the country below. But otherwise they cónsider that the man-only control is still the best and safest method of flying until we can perfect a machine which will be automatically stable without loading it with a number of delicate mechanical devices which are always liable to get out of gear. There are two schools of thought working on this great problem, one to make the machine itself stable by the construction of its surfaces, of which the Dunne is an example, and the other is the mechanical device on which Wright and Curtiss are working.

"Naturally the question of stability is of the greatest importance for the simple reason that an unstable machine means continuous work for the pilot, and a long flight on a machine of this type would be impossible unless it had duplicated control and two pilots so that one could relieve the other. Mechanical devices for gaining stability, if in good working order, would certainly be able to balance an unstable machine, but it is argued by the opponents of this system that it would be far better to concentrate our energies on the machine, which should be so constructed that the planes themselves act as balancers, as has been attempted in the Dunne biplane in this country, and to an even greater extent in Germany, where all the machines have planes not unlike the wings of a bird. To illustrate the point, we may take the case of a boat, which is more or less balanced on the sea by giving it a keel, enabling it to maintain its position in any ordinary sea. . . . A large number of experts explain away the possibilities of the mechanical device for aeroplanes and emphatically state that we must attempt to discover the secret of keeping the aeroplane from overturning by some naturally stable form, just as our ancestors found that by scooping out a log they could sit in it without experiencing the troubles of balancing with which they had previously to contend."



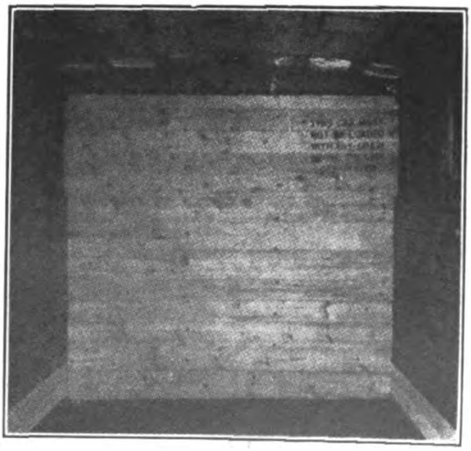
AEROPLANE SHOWING APPLICATION OF WRIGHT'S STABILIZING MACHINE.



CANADIAN PACIFIC BOX CAR END POSTS REINFORCED BY MEANS OF Z-BARS BOLTED THROUGH TO INSIDE LINING.

Reinforcing Wooden Box Cars.

THE Canadian Pacific Railway Company has recently been conducting some interesting experiments in the reinforcing of wooden box cars, in order that such equipment may be kept in service longer, without resorting to the repair track for repairs to center sills, draught gears and end structures. These experiments have led to the development of methods by which such troubles have been overcome with a minimum increase in cost and with no further delay to the car than if the original structure were to be renewed. For example, defective wood center



CANADIAN PACIFIC BOX CAR SHOWING RELINED END.

sills are replaced with 6-in. by 22.7-lb. steel "Z" bars. These sills are made up at the Angus shops of the road at Montreal, and shipped to all repair points where sill work is being done. The steel sills are bolted to the needle beams, rivetted to the body bolsters, and are securely attached to the end sills. Of the 2,700 cars equipped with these sills, the failures are stated to have been no more numerous than would have been experienced with any of the more costly steel underframes.

In reinforcing the ends of box cars 1¾-in. lining is applied over the old linings. This is an inexpensive method of repair inasmuch as the cost of repairs to the original lining is saved. The end posts which are so frequently broken are reinforced on the exterior by means of 3-in. by 6.7-lb. "Z" bars which are bolted to the old posts (the cracked posts not being removed), the bolts also serving to secure the heavy inside lining.

An Interesting Dump Car.

THE following photographs illustrate one of a number of cars recently constructed by the Orenstein-Arthur Koppel Company of Pittsburgh, Pa., to be used in railway ballasting, filling and construction work.

The car is all-steel with wood floor planks inserted instead of being wooden car tied together by a few iron bars and therefore, repairs are reduced to minimum as the only parts which wear out are the floor planks and these can be replaced without disturbing the frame of the car.

The ends are steel plate reinforced by six heavy gussets which are riveted to the long beams.

The doors are steel plate inside and outside with wood filler beams thus combining the elasticity of wood with the strength of steel.

The side chains which usually are used on cars of this type to hold them in position have been omitted and an automatic locking device substituted, this consisting of a heavy cast steel hook at each bolster. This hook engages downward-projecting links on the car. Both hooks on each side of the car are operated by levers placed on the end sill at diagonally opposite corners.

This construction makes it possible to unlock the car for dumping instantly and when the car is again brought to the upright position it locks automatically.

The underframe and end sills of the car have been made especially heavy and to conform with the Interstate Commerce Commission requirements, so that the cars can be shipped anywhere on their wheels and axles in trains consisting of heavy standard gauge equipment without danger of being injured.

The Employment of Brazing Machines for the Removal of Snow and Ice.

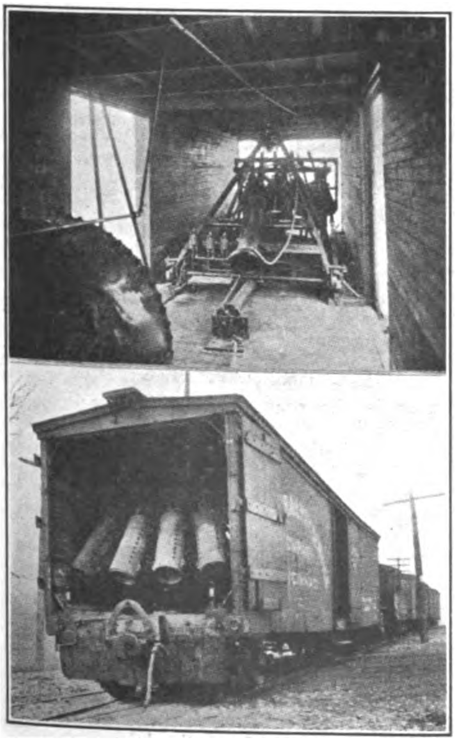
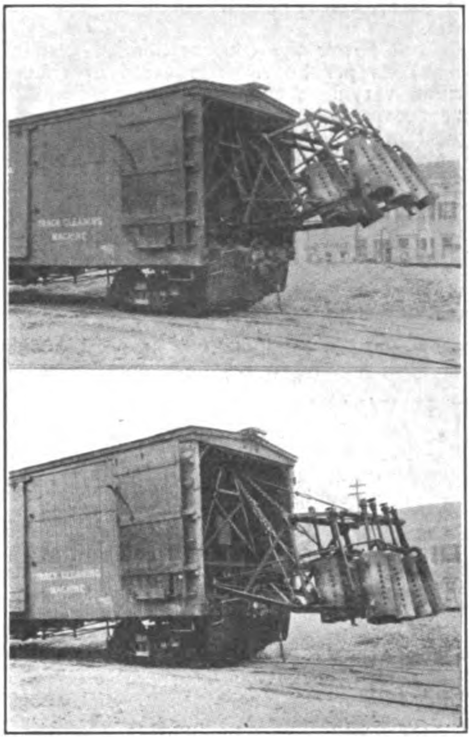
switches, frogs, interlocking connections, guard rails, switch stands and many other places.

This machine consists of two powerful burners each attached to a flexible oil tube connected with a seamless steel tank of eight gallons capacity with air pump and gauge. The powerful flame from the two burners can be connected or directed on a single point or used independent at any angle. The machine will burn for five hours in any blast without filling. In track operations, the machine can be placed beside the track and two men can work at the same time. Either gasoline or kerosene can be used or fuel. The machines are also employed in car repair shops, round houses, machine shops, boiler shops, etc.



Interior Views of the Lamb Weed Burner Car. Showing the Burner, Carriage, Tank and Fittings in Place.



Two Positions of the Burner When Extending from Car.

Upper position employed when passing over bridges. Lower position, when in full operation for the destruction of weeds.

The Lamb Weed Burner.

THE following photographs show the general appearance of the Lamb weed burner and the manner in which it is employed in clearing the right of way of weeds and other material which interferes with operation such as snow and ice. The device consists of a battery of burners mounted on a carriage so that it can be projected out over the end of the car. The carriage is made of structural steel and the wheels confined in twelve-inch channels for safety in transit and to keep the battery in place when in operation.

The length of the runway is regulated to extend the battery ten feet from the car and the movements of the carriage and battery are controlled by cylinders actuated by compressed air from the locomotives. The battery can be raised and lowered at will so that the fire can be directed to the ground or in the air when passing over bridges. Gasoline is employed as fuel, the battery having seven burners. The gas is forced from the generating coils through needle point orifices by compressed air at a pressure of one hundred pounds or more and the flame covers a width of twelve feet at the point of contact on the ground. The capacity of the fuel tank, which is also used as a receiver for compressed air, is 1,200 gallons. All apparatus is fastened strongly and firmly to the platform of the car and only all steel or steel covered cars are employed. A steel superstructure is built over the car to protect the machinery from the weather and all cars are equipped to pass interchange on all roads in the United States.

At full power the consumption of gasoline is 200 gallons per hour. The speed of transit in burning varying from four to twelve miles per hour according to the character and age of the vegetation. The average operating cost of burning weeds is about $4.00 per mile. This does not include motive power and rental. The best results are obtained when the growth is young, the burner then desiccating and destroying it entirely. It is asserted that the weed burner should destroy fifty miles per day unless the growth is very heavy and old and provided of course that it has the right of way.

Cast Iron Wheel Records.

H. H. VAUGHAN, assistant to the vice-president of the Canadian Pacific Railway, delivered an interesting address before the January meeting of the Canadian Railway Club on the above subject. He said in part:

"Practically all railroads have abandoned any form of cast iron wheel record which follows the history of each individual wheel. Apart from the enormous amount of work in reporting and entering the movements of several hundred thousand wheels which are in service in a large system, it is practically impossible to avoid incorrect numbers being reported.

"The difficulty of straightening out the errors that arose, errors which frequently were not disclosed for years after they actually occurred, and the correspondence involved in the attempt, were sufficient reasons for discarding a system that did not furnish sufficient useful information to justify its expense. The writer has not investigated methods used on other roads to describe them with accuracy in this paper, but believes that apart from the records maintained for guarantee purposes, the only systems in general use are those in which the average life of wheels removed from service for various causes, is determined in various ways. It is usual to show a figure for the average life of wheels obtained by dividing the number in service by the number removed per year, but this figure is not of much value as it depends more on the rate at which the number of wheels in service increases, than on the actual life of the wheels removed. Thus if the number of wheels in service remained stationary for a period of years, while the number of wheels removed increased 25 per cent, it would indicate a decrease in the average life of the wheels of 20 per cent, while if during the same period the wheels in service had increased 50 per cent, the same increase in the number of wheels removed would indicate an increase in the average life of 20 per cent.

"Now if the increase in the wheels in service had taken place in two or three years, it would have had comparatively little influence on the wheels removed, so that an increase in the life of the wheel might be shown by these figures, while a reduction had actually occurred. In addition reports of whels removed on foreign lines are not obtained correctly, especially for wheels removed on handling companies account and in general it is not uncommon for a life of twelve to eighteen years to be shown for wheels, when as a matter of fact they are lasting about five or six.

"The figures showing the life of the actual wheels removed can be obtained with considerable accuracy and with simple reports and records. Each wheel is marked with its number, the date cast, etc., so that no complications are introduced by recording the date put into service and the date removed. While no record is usually kept of any time the wheel may be out of service, or the movements of the car under which it has been placed, these factors are relatively unimportant on a large number of wheels and the average life of the wheels removed is a figure of sufficient importance on any road to justify the records and statements required. It should properly be kept by weight of wheels, so that any alteration that occurs in the life of wheels under the same weight of equipment may be distinguished from the changes due to the introduction of a greater proportion of heavier equipment or similar causes.

"While the average life of wheels removed affords valuable information over a period of years, it does not enable the result of any variation in the quality or service of the wheels to be detected until considerable time has elapsed and then only in a general way. When the wheel foundry methods of the Canadian Pacific Railway were revised in 1908, it became desirable to introduce some system by which it could be determined whether better service results were being obtained or not, without the complications of the old individual records.

"This was accomplished in a satisfactory and simple manner by comparing for each year's make of wheels, of the same weight and manufacture, the number removed for various classes of defect in each year of their life. This system does not require any additional reports over those commonly used. The only information needed is the make of the wheel, weight, date cast, maker and cause of removal, items that are likely to be reported accurately and which are those required for a record of any kind. As the number of wheels of any group cast in each year is known, the number removed in each year's life for each cause may be expressed as a percentage of the number made and this percentage may be compared year by year to determine the comparative service obtained from the different wheels.

"As the records are compiled in the Canadian Pacific Railway, no attention is paid to the date the wheel is put into service. For wheels made in any one year, the number removed in that year are taken as being removed in the first year of their life, those removed in the next year, as in the second year of their life and so on. This introduces an inaccuracy in the case of any particular wheels placed in service towards the end of the year, but the error becomes unimportant after a year or so and the labor of compiling the record is greatly reduced."

Salt as a Timber Preservative.

IN replacing a railroad trestle recently burned along the north shore of Great Salt Lake, engineers have just found that the piles are still perfectly sound after 43 years of service. Looking for the cause, since these were only local pine and fir, they found the timbers were impregnated throughout with salt from the lake.

At another point on the lake, 18-inch piles, set 29 years, are similarly preserved with salt which has penetrated to their very center. Timbers in the Southern Pacific trestles across Salt Lake, placed in 1902, appear to be as good as on the day when the piles were driven. They have been preserved well above water line by the salt dashed on to them by the waves, a fact apparently anticipated by the engineers who built the trestles.

The first transcontinental telegraph line, built before the railroad, extended west from Salt Lake City through the prosperous mining camps of Eureka, Austin, and Virginia City. When the railroad was built, the telegraph line was transferred to follow its right of way and the old poles sawed off at the ground. An engineer who recently examined the butts left in the ground in the salt desert near Fish Springs found that, although fifty years had passed since the poles were cut off, the old butts were perfectly sound.

Telephone and electric companies in the Salt Lake valley have used the local salt for preserving poles. When set up, about 75 pounds of salt is placed around the pole on the ground. This method can not be used, however, when the pole is on or near a lawn, or in any place where vegetation is desired.

It is pointed out that the reason why the waters of Salt Lake act as a strong preservative, as distinguished from ocean waters, is because the lake water is so much saltier, being practically a saturate solution. Preservation with salt is of no use in ocean piling against the attack of teredos and other marine borers.

Experts in the forest service who have been investigating the preservative treatment of timber offer the suggestion that ties and poles which have been immersed for some time in the waters of the lake ought to be impervious to decay if the salt is not leached out by the action of the elements. It has been suggested that this can be guarded against, for example, by painting the butt of the pole with a coat of creosote which will keep out the moisture and keep in the salt.

Electrical

The Trend of Electric Locomotive Construction.

IN a recent issue the *Commercial and Financial Chronicle* calls attention to the fact that the building of electric locomotives is still restricted within limits imposed by the system of current transmission on the lines for which engines are to be used.

Engineers in making their choice between these systems and in designing heavier and more powerful locomotives for high-speed passenger trains and for haulage of freight over severe mountain grades have many considerations to take into account other than the simple comparison of weight and maintenance that may be drawn between engines constructed to suit one or other of the rival systems of current transmission.

The advantages of greater simplicity in one type of locomotive may be offset in the greater expense of coal used in raising the energy at the power house. Locomotives, however, used on systems of both direct current and single-phase installations have been running continuously so satisfactorily that arguments as to their comparative merits fall somewhat flat.

The new rolling stock ordered in 1913, in addition to new improved engines of the same types, has a new type of locomotive, the so-called split-phase locomotive, designed specially for the Norfolk and Western Railway. These locomotives, 24 of which have been ordered of 135 tons weight and 11,000 voltage, will supersede some of the most powerful Mallet steam locomotives of the world and haul 3,250-ton trains at 14 miles per hour instead of seven, thus doubling the capacity of the mountain division of the road. The electric zone of the New Haven system now calls for 100 electric locomotives, embracing switcher, freight and passenger services. The Pennsylvania Railroad's 600-volt locomotives in their second year's operation established higher records than in the initial twelve months of the service. But with the increase in the potential voltage to 2,400 volts and the building of turbo-generators in units of 35,000 kilowatts a corresponding increase in the size and power of locomotives seems a certain accompaniment.

Last year showed no great step forward in output, chiefly because of financial reasons, as the number of electric locomotives ordered was only 68, as against 65 in the preceding year; but the engines now building include several of the larger type. The New York Central has ordered 16 high-speed engines for terminal service out of New York City, 10 of which weigh a hundred tons each and develop 1,460 horsepower continuously. They will operate 800-ton trains on the local branch at 65 miles per hour. The other six, which are of 110 tons, will operate 1,200-ton trains on the level straight track at 57 miles per hour. The Canadian Northern Railway, for its electrification of the tunnel and terminal entering Montreal, will employ seven locomotives of 83 tons weight operated on the 2,400-volt direct-current and the Canadian Pacific has similarly decided to electrify its Rossland division on the same system and employ four 92-ton locomotives for the service.

While attention has been mainly concentrated on such powerful units already employed or being constructed for the big "common carriers," the remarkable increase in the use of electric locomotives for industrial, mining, dock, canal and similar purposes has generally escaped notice. No complete official census has been made, nor, indeed, has it been possible so far for any comprehensive set of figures to be collected and collated. It is, however, accepted in authoritative quarters, basing the estimate on authentic information, that there are at least 12,000 electric locomotives used on private or semi-public trackage for the use of mining, industrial and similar plants requiring yard and local transportation facilities. These units range in power capacity from 15 to 20 horsepower and in weight from a few tons up to the biggest size of 80 tons. They are, of course, used by common carriers, of which there are now sixty-eight employing such small locomotives for subsidiary work.

The *Chronicle* believes that great development may be expected in the use of electric power in freight and assembly yards and for similar switching service in and around industrial plants. The switching service, owing to its inherent requirements, has always presented the most difficult problems for the operating electric engineer.

But improvements in the control equipments and the slow-speed electric locomotive is producing an excellent type of engine which will doubtless prove beneficial to the various belt lines joining freight terminals in cities or in linking up waterfront wharves with trunk line systems.

Terminal Improvements

Rochester's New Passenger Station.

THE New York Central Lines has given to Rochester, New York, a new and artistic passenger station, which in the future will be used by all through trains of this system, as well as by the branch line trains on the Auburn Road, the Rochester and Charlotte branch, the Rochester and Niagara Falls branch and the Ontario and St. Lawrence division. The new station, which is of the through type, has eleven station tracks and is served by six platforms in addition to two through passenger and two freight tracks not adjacent to these platforms. Each station track has a capacity of fourteen cars or a total capacity of 154 cars.

The frame of the building is of steel and the walls Medina sandstone up to the second floor level, and of a reddish purple brick for the remaining height. Long Meadow sandstone is used for trimming purposes. The four story portions at each end of the building, as indicated in the photograph, contain accommodations for the office force.

The main waiting room which is about ninety feet by one hundred and fifty-five feet and fifty-four feet high, is unusually large and artistically finished. Seating capacity for four hundred and forty people is provided and a broad stairway leads down from the main entrance to the waiting room floor. The benches are surmounted by double bracketed reading lamps. The coloring effect is particularly attractive and gives the room a warm rich appearance without any suggestion of the ornate.

Along the street side of the waiting room on either side of the main entrance are located the information and parcel rooms and the men's pay toilets. Directly across the room from the main entrance is the vestibuled entrance to the concourse. To the east of this entrance is the baggage checking counter which adjoins the baggage room on the rear. On the other side of the concourse entrance are the news stand, telegraph booth and a passageway from the concourse for the use of passengers coming from trains who want to enter the waiting rooms. At the west end of the waiting room are located the lunch room and dining room with the smoking room and men's free toilet in the corner next to the street. A row of telephone booths is placed along the wall between the entrances to the lunch

room and dining room. At the opposite end of the waiting room is the ticket office and in the front corner on that end are the women's rooms and toilets. Quarters for a barber shop, the station master, the station police and a branch station of the post office are provided on a mezzanine floor around the waiting room.

A special hospital room is provided in the express building which can be reached from the first platform. This room is fitted with hot and cold water and all necessary first aid supplies.

Chicago Railway Terminals.

W. H. LYFORD, general counsel of the Chicago and Eastern Illinois, delivered an extremely interesting address before the Traffic Club of Chicago, on February 26th, dealing with proposed improvements in terminal facilities at Chicago. While Mr. Lyford, at the present time, is representing the Chicago and Eastern Illinois, in the capacity of general counsel, he was previously, for several years, in the engineering and operating departments of this Road, and is one of the leading authorities on Chicago railway terminal affairs. His address is a valuable contribution on this important subject, and is herewith reproduced in full:

"There are 31 trunk lines of railroad reaching Chicago, owned by 24 separate companies. All of these lines come into terminals within an area about a mile square, in the center of the city. From this small center they radiate like the spokes of a wheel in every direction excepting due east.

"There are six passenger terminals, which collectively receive all through trains and, with the exception of the Illinois Central, all suburban trains. There are 56 freight stations in the down-town district, and 144 in the entire city. The railroads handle, in and out of the city daily, about 125,000 suburban passengers and 70,000 through passengers. They also bring into the city 260,000 carloads of freight per month, and take out about the same number, handling in and out about 17,500 loaded cars per day.

"I think I may safely say that only one of the passenger terminals in this city, the North Western, is in any sense permanent. All of the others have already outgrown their usefulness and will soon be entirely changed and rebuilt or combined on broader lines.

"The Union Station on the west side is to be replaced with a monumental structure in the same neighborhood. The Pennsylvania, Burlington and St. Paul, which use it, want to remain on the west side, and the people of this city are willing that they should do so.

"I predict that all of the other lines will join the Illinois Central in the magnificent station which it is about to construct on the lake front at Twelfth Street. That station should be capable of taking care of all of us for fifteen or twenty years, and if we should then outgrow it, some of us can move west of State Street, where we own ample property for a passenger station for all time.

"Certainly the new North Western Station, the new Union Station, and the new Illinois Central Station will have ample capacity to take care of the through passenger traffic of this city for many years to come.

"So long as the people on the west side want to keep two large passenger stations on that side of the river, we owe it to the traveling public to connect the west side stations with the Illinois Central and any other stations on this side of the river by direct surface or subway lines on which passengers can conveniently transfer from one station to another with their hand luggage and at a cost of five cents.

"The suburban passenger has no use for a monumental terminal station. He wants to reach all parts of the business district of the city, and for his purposes there should be a number of stations or covered platforms within the loop district, at any one of which he could stop, and at some of which he could transfer to any surface, subway or elevated line to any part of the city.

"A subway loop connecting all of the terminal passenger stations, for the sole use of suburban trains, has been suggested. It is utterly impracticable. All of the suburban fares collected on all of the railroads in this city would not pay the interest on the cost of a subway sufficiently large to carry all of these suburban trains. Excepting the Illinois Central and the North Western, all of the other roads are losing money on their suburban business now. The suburbanite cannot afford to pay materially higher rates than he is now paying.

"There is only one proper solution of the suburban problem, and this is the thought to which I wish to give prominence on the passenger question, namely, one of the subways which are proposed should be connected with all of the railroads at points outside of the business district. All suburban trains of the steam railroads should pass through the subway loop instead of stopping at the passenger terminals. A sane development of this idea will be the turning over by the steam lines of all their suburban business to the company which operates the subway, and by electrifying the suburban tracks, moving the subway trains out on the steam railroads through the suburban district. I have been advised by competent authority that this electrification will not cost more than $5,000 per mile of single track.

"Until the subways are constructed, the suburban trains could be transferred to the elevated roads at existing crossings of the steam lines, at substantially the same points I have named for connections with the subways. All suburban trains could then run at high speed on the steam railroads, and take their passengers to any point in the loop district or, by convenient transfers, to any part of the city on any surface, elevated or subway line. Two or three cents additional fare per trip would be the outside limit of increase from his present fare, and he would be given the privilege of universal transfer to any part of the city without extra charge.

"That the operation of electrified suburban trains on the same tracks with through passenger trains is feasible, has been proven by the experience of the New York Central Railroad at New York City. The wonderful success of the Interborough subway in the same city has established the practicability of operating high speed, ten-car, suburban trains through a subway loop.

"The subject of freight terminal facilities is far more important than the subject of passenger terminals. On account of the radiating lines of railroad extending in all directions from the congested center of the city, industrial centers have been built up in all parts of the city along these radiating lines. As a general rule, the only direct connections between railroads which interchange traffic at Chicago are at the hub of the wheel in the congested district bounded by Kinzie, Canal, Sixteenth Street and Lake Michigan.

"Of the enormous volume of freight traffic coming into this, the great railroad center in the world, 51 per cent is destined to Chicago, and 49 per cent passes through Chicago. Of the through freight, 70 per cent is now delivered directly by the inbound to the outbound line, and only 30 per cent is handled by belt lines. The 70 per cent which is directly delivered, passes through the congested part of the city, and is the cause of a large part of the smoke nuisance charged to the railroads and a large part of the congestion of downtown tracks.

"The elimination of carload transfers from the downtown district was first undertaken by the railroad companies because it was the easiest problem to solve. Its solution is at hand in the reorganization of the Belt Railway of Chicago, which was accomplished in November, 1912, and in the extension and improvement of the large yard at Clearing, which is now under way. Twelve railroads have entered into a lawful combination to solve this problem. All of the other roads will join them when they are ready to commence operations.

"The Clearing yard and its approaches and appurtenances will be completed by next October, and all interchanges of carload freight and empty cars will then be removed from the city. Each company with its own engines will take to Clearing solid trains made up of cars for other roads. At the Clearing yard these cars will be distributed by gravity into solid trains for each load. The same engine and crew which brings the miscellaneous train to the Clearing yard will return to its own road with a solid train to go out on its line.

"All empty cars will also be distributed into solid trains for the owning roads, and the Clearing yard will become a reservoir for empty cars.

"The place selected for the Clearing yard separates the western and northern roads from the eastern and southern roads, and is the natural point of interchange. The Clearing yard consists of a tract of land one-half mile wide and 3½ miles long, with the open avenue of the inner Belt connecting by the shortest possible route with every railroad reaching the city. The Clearing yard also connects at the west end with another Belt line, which will furnish another avenue for reaching every trunk line. In one or the other of these two belt lines, every railroad whose lines reach Chicago is financially interested, with the exception of the Chicago Great Western and the Alton, and the Alton is directly connected with the Clearing yard.

"The Clearing yard has been consolidated with the inner belt, and twelve railroad companies have secured the use of the combined plant for fifty years. Provision has been made to the extent of $50,000,000 for increasing the trackage and other facilities of the inner belt and Clearing yard, so that every railroad may have an open line of connection with the Clearing yard. The establishment of the Clearing yard makes possible another revolution in the freight handling facilities of this city, the effect of which will be more far-reaching and more advantageous to the people of the city than any change already suggested.

"The railroads daily bring into this city 10,000 tons and take out 15,000 tons of less-than-carload freight. Only forty per cent of the inbound freight is delivered to the consignee at the terminal station of the inbound road. Sixty per cent or 6,000 tons of freight per day is taken out of inbound cars at the terminal stations and transferred to other roads, the transfer being made as follows: By trap cars, 30 per cent, by teams 52 per cent, and by tunnel 18 per cent.

"Of the 9,000 tons of outbound l.c.l. freight originating at Chicago daily, and shipped from the outbound freight houses, 52 per cent comes to the house by trap cars, 28 per cent by teams, 13 per cent by tunnel, and 7 per cent by lighters on the river. The 41 per cent of outbound freight received by teams and tunnel leaves the city the same day and it is shipped from the industry. The 59 per cent received by trap cars and lighters leaves the city not earlier than the evening of the next day after it is shipped.

"The volume of l.c.l. freight which under present methods must be handled at the downtown freight terminals has already outgrown the capacity of the terminal facilities and the capacity of the streets leading to them. The result is an average delay of more than an hour for each team, and a congestion of downtown streets which has become unbearable.

"The use of motor trucks for station work is prohibited by the amount of dead time lost in reaching the station platform. The cost of team delivery of l.c.l. freight to and from the loop district exceeds an average of $1 per ton. For longer trips it reaches $2 per ton. Unless the shipper has direct access to the tunnel, private switch or lighters, he must deliver his freight for each road at its terminal station, generally requiring a separate trip to each station because of the street congestion and the delays at the station. Only a few large shippers have access to the tunnel, lighters or private switches.

"The average citizen must team his freight, at a cost to him of at least $1 per ton. Trap car, lighterage and tunnel charges are paid by the railroad companies. Mr. Brandeis, the present mentor of the Interstate Commerce Commission, has discovered this fact, and has decreed that this alleged discrimination in favor of the few large shippers who have access to the tunnel, lighter and private switch must cease. Whether we approve or not, the absorption of these terminal charges as a part of the transportation rate is doomed. I predict that within three months the shipper who is now enjoying this service free, will be paying at least $1 per ton for it. If he abandons this service, he must resort to teams, and the streets in the downtown district, which are already congested, will become absolutely impassable.

"While the shippers are facing this dilemna, the railroads are facing a greater one. The cost to the railroads of handling l.c.l. freight through the city of Chicago under present methods, is more than the profit derived from its carriage to and from the city. We are prepared to prove that on some classes of l.c.l. freight shipped, say, from Pittsburgh to Milwaukee, by way of Chicago, the cost of handling the freight within the city limits of Chicago exceeds the gross revenue charged for the entire transportation from Pittsburgh to Milwaukee.

"The volume of traffic at Chicago is increasing at the rate of five per cent per year, and as our terminal facilities are already congested, the cost of handling, per ton, increases with the volume. To acquire the necessary real estate in the downtown district to enlarge our terminal facilities along present lines, would cost from $20 to $40 per square foot, and even if the railroads could afford it, the city would not permit them to extend their Chinese wall in the congested district. The problem must be solved in some other way.

"After studying this great problem in all its phases for many months, we are prepared to suggest a remedy. It is not an untried remedy, but we have devoted much time and thought to its investigation and have discussed every phase of it with the men who are most competent to judge as to its practicability, having had years of experience in the actual handling of freight. They all agree that the l.c.l. clearing house will best meet the needs of both shippers and the railroads.

"The cities of St. Paul and Minneapolis have for several years enjoyed the facilities of an l.c.l. clearing house. First, the Minnesota Transfer Company was organized and established a crude transfer platform half way between St. Paul and Minneapolis, at which transfers of l.c.l. freight were made for all of the railroads. Later, the Hill lines, the Great Northern and Northern Pacific established clearing houses of their own, the Hamlin Transfer and the North Town Transfer respectively, at which was delivered all of the l.c.l. freight for each of these lines originating at either St. Paul or Minneapolis, the movement from the city to the transfer plant being made in trap cars miscellaneously loaded. Later, the Chicago, Milwaukee & St. Paul established a similar clearing house known as the Twin City Transfer, for its l.c.l. freight from these two cities. The results in each case have been a heavier lading of outbound cars and economy in handling.

"President Earling, of the Milwaukee lines, has stated that by the use of the clearing house the l.c.l. freight moving out of St. Paul and Minneapolis on his line is being handled in forty per cent less cars than were required under the old method which is in vogue in Chicago.

"We propose to establish in the vicinity of the carload clearing yard, a series of houses side by side, and all connected with each other by a cross platform. The several units as well as the cross platform will be equipped with moving sidewalks and each railroad company will lease and operate one or more units of the station, each unit consisting of one platform with its mechanical appliances for moving freight and with two railroad tracks on one side for loaded cars and five or six tracks on the other side for empty cars to be loaded in station order for destination.

"Instead of standing 100 to 200 cars at each downtown station, and allowing them to remain there all day, to be loaded for destination, we propose that all cars loaded in the downtown district shall be loaded to the roof, as trap cars, and moved to the clearing house as soon as loaded, instead of remaining all day in the downtown district. The 59 per cent of l.c.l. freight which now reaches the downtown station by trap car and lighter, will be sent directly to the clearing house, which it will reach in less than one-half the time now taken to reach the downtown house. The thirteen per cent of tunnel freight should also go directly to the clearing yard, either by tunnel or by trap car from some convenient tunnel station. This would wholly remove from the downtown station from 59 to 72 per cent of all the freight which now occupies it, and to that extent would increase its capacity for the legitimate business for which it is necessary.

"We then propose to double the capacity of the present downtown house by opening broad streets or driveways on each side of it, and placing the tracks under the streets and driveways, thus giving teams access to both sides of the house, instead of one side as at present, and also enabling the truckers to load into cars on both sides of the platform. The freight will be moved from the street level to the lower or track level by the use of the ramp, with mechanical appliances to regulate the speed of the truck which carries the freight.

"The congestion of downtown streets leading to the freight district will be removed by straightening the river, so that Franklin, Fifth Avenue and La Salle Streets can be opened through to the south, at least to Archer Avenue. We would add also to intermediate streets or driveways, 70 feet wide, leaving the buildings 60 feet wide, which is ample for station purposes and is an economical width for commercial purposes. The use of trap cars at the downtown station, and the loading of the nearest car to its full capacity, would eliminate all longitudinal trucking from the station platform, and would again double the capacity of the platform for handling traffic. The use of the clearing house for classifying freight would make possible the location of universal freight houses in every industrial district of the city. This would enable one shipper to take to one station all freight for all roads, thus materially reducing the number of teams or motor trucks required for this purpose. The freight would be moved in trap cars to the Clearing yard, and there redistributed and loaded for destination.

"All lighter freight would be carried by the lighters to one convenient point, and there loaded into trap cars which would be sent to the clearing house instead of being transferred, as now, to the downtown station. We should largely increase the lighterage service by establishing continuous docks along the straightened river or at street ends, from which freight would be taken to a convenient lighterage transfer for loading into trap cars for the clearing house.

"Lake freight also could be most economically handled at the Clearing yard. At the new city harbor north of the river, all l.c.l. freight not destined for team delivery in the central business district would be placed in trap cars and carried in full trains by the Northwestern to Clearing, or placed on lighters and carried on the river and drainage canal to Clearing or to the lighterage transfer.

"The South Chicago harbor is already connected with the Belt Railroad, of which the Clearing yard is a part, and all freight arriving at South Chicago would be transferred by rail to Clearing. Finally, we would recommend that the surface traction lines be authorized to move trap cars between 2.00 and 5.00 A. M. from surface side tracks to railroad freight yards, to be thence moved by the steam railroads to the Clearing yard.

"The efficiency of a clearing house depends upon the extent of its use . If only one-half of the l.c.l. freight of the city is handled in the clearing house, it is only 50 per cent efficient. If all of the freight is centered there, its efficiency is 100 per cent. The comprehensive plans which I have outlined contemplate 100 per cent efficiency.

"Assuming, as we must, that the absorption of existing lighterage trap car and tunnel allowances must be discontinued, we have gone far enough to feel assured that by the adoption of the Clearing system, the cost of handling and transporting l.c.l. freight to and from and through the city of Chicago will be reduced 50 per cent to the railroads and 75 per cent to the shippers.

"As to delay of freight, we are satisfied that package freight delivered at the downtown stations before two P. M. will leave the city for destination as early in the evening as at present, while freight delivered at the downtown houses after two P. M. will leave the city about six hours later than at present. On the other hand the much larger volume of freight which is now handled by trap cars and lighterage, and all of the transfer freight, will leave the city eighteen hours earlier than at present. While the downtown freight house is limited in its operations by the hours of the working day, the operations of the clearing house, to which the public has no access, will be continuous day and night.

"The clearing house opens up another possibility of tremendous importance to the shipper. The railroads will need for their purposes only the track floor of the clearing house for the handling of freight, and possibly one other floor for the clerical force. Ten-story warehouses could be constructed above the different units of the clearing house, and the cross platform which will connect them, and the space in such warehouses would be the most attractive and economical of any warehouse space in the world, being directly connected with platforms from which freight is being shipped to every part of the world."

Ordinance Passed for Chicago's New Union Terminal.

AN ordinance has at last been passed by the Chicago City Council, granting the railroads which now enter the Union Station, the right to construct new and extensive terminals according to plans set forth in the ordinance which among other things provides for the erection of a new passenger terminal at a cost of approximately $40,000,000, which will be used by the roads now using the Union Station, namely, the Pennsylvania, the Chicago, Burlington and Quincy, the Chicago, Milwaukee and St. Paul and the Chicago and Alton. The passenger station will comprise a monumental structure occupying the entire block bounded by Adams, Canal, Clinton and Jackson Streets, with a passage the full width of the block under Canal Street to the concourse and train shed, situated in the space between Canal Street and the river and extending both north of Adams Street and south of Jackson. In this respect the present plan follows the design originally prepared by D. H. Burnham and Company.

The freight terminal is to be for the use of the Pennsylvania Railroad only, and its location was modified in the later negotiations. As now provided for, it will be built east of Canal Street and south of Polk Street. Most of it will be north of Twelfth Street, but a part may extend as far south as Sixteenth Street.

In the provisions of the ordinances the railroads agree to co-operate in the straightening of the Chicago River south of Taylor Street, and to give property required in this straightening at a price fixed by arbitration. This enterprise will cost a large sum of money, but concerning it Mr. Arnold said: "The expense of changing the river would not only be more than fully realized by the railroad companies who now own practically all of the abutting property on both sides of the river, as far as it is herein recommended to be changed, but they would also profit greatly by the change." The companies also agree to a number of other related improvements, which with their respective costs, may be summarized as follows:

To widen Canal Street to 100 ft. between Washington and Twelfth Streets, with permission to locate two more tracks on the subsurface, $2,375,000; to build a viaduct 118 ft. wide in Twelfth Street, between Canal Street and the west bank of the river, $270,000; to construct an elevated roadway between the west and north sides of the city, the expense being divided with the Chicago & Northwestern Ry., $650,000; to build and maintain a new viaduct at Monroe Street when the city constructs a new bridge, $100,000; to widen all viaducts between Lake Street and Twelfth Street to the full width of the streets east of the river, $1,760,000; to grant an easement for Congress Street over the railroad property each of Canal Street, and to construct a viaduct the width of the street east of the river, $300,000; to build viaducts and rearrange approaches at Sixteenth and Fourteenth Streets, $400,000; to repair and maintain all the viaducts included in the foregoing, and to pay adequate compensation for all streets and alleys vacated. The list of expenditures recited above totals $5,855,000, and may correctly be considered as the compensation which the city has exacted for permission to the railroad to proceed with the improvements.

The expense of the entire terminal project is placed roughly at $65,000,000, which includes about $15,000,000 already spent for land. It is estimated that the work will employ 10,000 men for more than three years. The buildings involved in the entire project will contain an aggregate of 48,000,000 cubic feet. The train sheds will cover an area of thirteen acres, and will involve with the immediate trackage, 50 miles of new track. Including the viaducts, the plans call for the revamping of 16 acres of street space, in which about three miles of new sewer will have to be constructed. The general waiting room of the new passenger station will have 31,000 square feet of floor space. This is surpassed by only two stations in the world, Washington and Leipsic. The South Station in Boston, has 15,000 square feet, the Pennsylvania in New York 29,500, the New York Central in New York 20,000, Washington 35,000, St. Louis 19,000, Baltimore Union 7,000, Northwestern station, Chicago, 24,000, and La Salle Street station, Chicago 13,000.

No delays are foreseen in proceeding with the project and it is now expected that actual work will be started early in May. The railroads are allowed five years in which to complete the work. D. H. Burnham & Co., architects, are at work on the designs and will superintend the construction of the entire project.

Norfolk and Western's New Coal Pier at Norfolk.

THE Norfolk and Western has recently completed a large steel pier at Lamberts Point, which is to be employed for transferring coal from cars to vessels and is fully equipped for mechanical operation. There is already at this point a large storage yard with classification and other switching tracks, round house and locomotive facilities, two warehouses and three wooden coaling piers. Demands for increased facilities, however, have made necessary the construction of the new steel pier which has been built of such length that a vessel can be loaded therefrom with several classifications of coal, without moving. The new pier is 1,200 feet long, with double rows of pockets, making it possible to simultaneously load vessels on both sides. The accompanying illustration presents a general view of the complete structure.

The transfer cars employed in connection with this pier are equipped with electric motors and operated by trolley system. As each becomes loaded at the dumper, it passes to an elevator of ordinary but heavy construction by which it is lifted to the top of the pier ninety feet above the water. The car is then run to a position for dumping into any desired pocket leading to the vessel. The empty transfer car is then passed to the west end of the pier and from there is switched to an incline leading down through the center of the pier to the car dumpers again. By operating both car dumpers and twelve transfer cars, the pier can handle and load coal into a vessel at the rate of one hundred tons per minute.

Coal Loading Improvements at Baltimore.

PLANS have been completed for equipping the large coal pier in the Curtis Bay export terminal of the Baltimore and Ohio Railroad at Baltimore, with automatic telescopic chutes, to prevent the breakage of coal in loading shipments from the cars directly into vessels. The new device, which will be put in operation at Curtis Bay, for the first test in this country, will mark an advanced step in the method of loading coal, overcoming the annoyance of having coal broken, which has been unavoidable up to the present time.

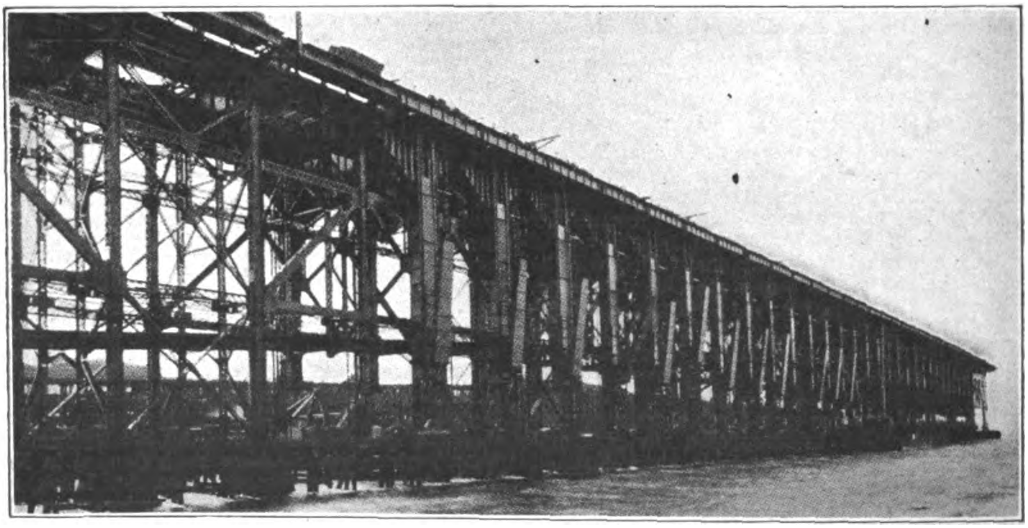
The automatic chute will be attached to the end of the pocket through which the coal passes when leaving the car, and, being adjusted to an easier angle, will overcome the force of gravity. The chute is collapsible in design, after the manner of the folding drinking cup, and carrying the coal to the hold of the vessel the chute folds up automatically.

It is also planned to attach a spiral chute to the Curtis Bay pier, designed to likewise eliminate breakage of coal. This latter chute will be installed as an experiment and will be watched with interest by coal operators and railroad companies.

With the new chutes in operation, it is believed that the new pier will be particularly well equipped to meet the requirements of foreign coal users, who prefer large-lump bituminous fuel.

Proposed Electrification on Canadian Pacific.

WESTINGHOUSE, CHURCH, KERR AND COMPANY, of Montreal and New York, have been retained by the Canadian Pacific Railway as engineers to investigate the matter of the proposed electrification of the new double-track, 5½-mile Selkirk Tunnel in British Columbia. The investigations will cover in general the type of system to be installed, the relative economies of steam and water power and the effect of the electrification upon operating conditions.



THE NEW COAL PIER OF THE NORFOLK AND WESTERN RAILWAY AT LAMBERT'S POINT TERMINAL.

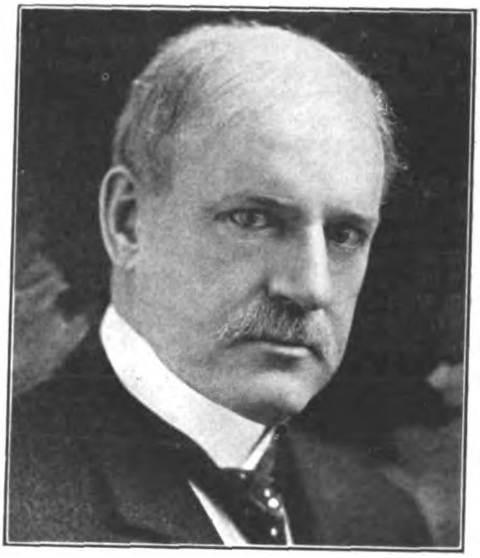
Interstate Commerce Commission

The Commission's New Chairman.

FOLLOWING the precedent established some years hence, to annually appoint a new chairman, Commissioner James S. Harlan has been selected for this honor during the current year, succeeding Chairman Edgar E. Clark.

Mr. Harlan, who was born in Evansville, Ind., in 1861, became a member of the Interstate Commerce Commission in August, 1906. His father was John Marshall Harlan, a Justice of the United States Supreme Court until his death in 1911. He is a graduate of Princeton University and was admitted to the bar in 1886, and in the same year became a member of the firm of Gregory, Booth and Harlan, which later became Harland and Harlan. In 1901 he was appointed attorney-general of Porto Rico, a position he held for two years, and in 1906, as above mentioned, he was appointed by President Roosevelt to the Commission.

Both on account of his training and experience, Commissioner Harlan should make an unusually able and satisfactory chairman, and this opinion is being justified in the manner in which he is conducting the advance rate case, undoubtedly the most important procedure which has yet come before the Commission. On a just decision depends not only the prosperity of the railways, but, to a large measure, the prosperity of the entire country, and the chairman's questions, put to witnesses and lawyers from time to time, indicate plainly an effort to separate the essentials from the non-essentials, and a desire to confine, so far as possible, the issue to the main points involved.



JAMES S. HARLAN.

Recent Appointments to the Working Force.

FRANK H. ADAMS, who until recently has been engineer of shop extension for the Santa Fe System, has been made staff mechanical engineer in charge of the valuation of motive power for the Commission in connection with the physical valuation of railroads. Mr. Adams' territory will embrace all the railroads in the Western District composed of North and South Dakota, Nebraska, Kansas, Oklahoma, Texas, New Mexico and a portion of Arkansas and Louisiana. His duties will be to supervise the valuation of motive power, rolling stock, shop machinery and tools.

Mr. Adams began service with the Santa Fe on the Gulf Lines on February 1, 1891, in Galveston, Texas, as chief mechanical draughtsman, and later was transferred to Cleburne to superintend the arrangement and installation of the equipment of the shops then nearly completed. On November 1, 1901, he was promoted to the position of engineer of shop extension with headquarters at Topeka, Kansas.

Morris A. Zook.

MORRIS A. ZOOK, recently appointed Resident Engineer, Division of Valuation, Interstate Commerce Commission, with office at Washington, D. C., was born March 2, 1859 at Philadelphia, Pa. He graduated as civil engineer from the Pennsylvania Polytechnic College in 1879, after which he entered the service of the P. B. & W. R. R. as draftsman in the car shop at Wilmington, Delaware.

After a few months of this service he became, successively, assistant engineer, resident engineer, chief of location on the Shenandoah Valley and the Norfolk and Western Railroads.

In 1883 he entered the service of the Pennsylvania Lines West, being successively assistant construction engineer; chief engineer, Indianapolis Union Railway; engineer, M. of W., Indianapolis and Vincennes Railroad; and engineer, M. of W., Chicago Division, St. L. & P. R. R.

In 1890 he entered the service of the L. N. A. & C. Ry. (Monon Route) as engineer of M. of W. and later becoming superintendent of the same line.

In 1892 he became engineer, M. of W., of the Queen and Crescent in which position he continued until 1898 when he became, successively, engineer, M. of W. and engineer of the L. E. & St. L. C. R. R.

In 1902 he was engineer in charge of reconstruction of the L. & S. Division of the Central R. R. of N. J.

In 1904, after twenty-five years of continuous railroad service he retired to take up independent work as a consulting engineer. In this capacity he engaged in numerous important works as follows:

(a) Chief engineer in charge of location and construction of railroad lines for Peabody Coal Company.
(b) Valuation of N. Y., N. H. and H. R. R.
(c) Special engineer in charge of location of Havanah Central R. R. from Havanah to Cienfuegas, Cuba.
(d) Valuation of railroads in Montana.
(e) In charge of rehabilitation work, Chicago and Great Western R. R.

(f) Valuation eastern lines, Canadian Pacific Railway.
(g) Valuation of railroad lines in Missouri and of joint lines, Wabash Railroad in Canada.

Mr. Zook is a member of the American Society of Civil Engineers and of the American Railway Engineering Association.

Charles H. Spencer.

CHARLES H. SPENCER, engineer of the Washington Terminal Company, Washington, D. C., has been appointed assistant district engineer of the Eastern District, Division of Valuation, Interstate Commerce Commission, with office at Washington.

Charles H. Spencer.

Mr. Spencer was born May 7, 1867 at Detroit, Michigan, and was graduated from the University of Michigan in 1896. He began railway work in March, 1897, with the Lake Shore and Michigan Southern Railway as rodman. During 1898 he was transitman for that road. From 1899 to June, 1900, he was chief draftsman and assistant engineer, M. of W., for the Southern Indiana Ry.

From January, 1900, to July, 1903, he was successively, chief draftsman to the engineer of construction and assistant engineer in charge of construction on the Baltimore and Ohio Railway, West of Pittsburgh.

In July, 1903, he became resident engineer in charge of construction, the Washington Terminal, Washington, D. C., in which position he continued until the completion of that work when he became engineer at the Washington Terminal in charge of the Maintenance of Way Department.

Mr. Spencer is a member of the American Railway Engineering Association, Railway Signal Association, American Railway Bridge and Building Association and for the past three years has been chairman of the Committee on Yards and Terminals in the American Railway Engineering Association.

B. T. Elmore.

B. T. ELMORE, recently appointed engineer of roadway and track for the Eastern District, Division of Valuation, Interstate Commerce Commission, with office in Washington, D. C., was born December 14, 1866 near Mobile, Ala. He graduated as a civil engineer from the University of the South, at Sewanee. He began railroad work in January, 1886, and from that time until March, 1899, was employed as rodman, transitman, draftsman, masonry and tunnel inspector, assistant engineer M. of W., resident engineer on preliminary and location surveys. Resident engineer on new construction and revision of alignment and grades on various railroads in Alabama, Georgia, Tennessee, South Carolina, Virginia, West Virginia and New York. From 1899 to 1901 he was resident engineer on surveys and construction on the B. & O. S. W. Railroad in Indiana; in 1901-1902 assistant engineer on grade revision St. Louis-Louisville Lines for the Southern Railroad in Indiana and Illinois. October, 1902, to February, 1914, locating engineer, engineer of surveys, assistant chief engineer and division engineer for the Virginian Railway, having charge of surveys and construction of the greater part of the Virginian Railway and branches.

Mr. Elmore is a member of the American Railway Engineering Association.

Warrick R. Edwards.

WARRICK R. EDWARDS, assistant engineer of bridges, Baltimore and Ohio R. R., has been appointed senior structural engineer of the Eastern District, Division of Valuation, Interstate Commerce Commission, with office at Washington.

Mr. Edwards was born at Kirkwood, Mo., February 8, 1869. He graduated from Washington University, St. Louis, with the degree of Bachelor of Engineering in 1888, and entered the service of the Bridge Department of the City of St. Louis, where he remained until June, 1889. He then entered the service of Mr. George S. Morison, consulting engineer, as rodman on the construction of the Mississippi River Bridge at Memphis, afterward serving as shop inspector on superstructure of this bridge.

In 1892, he was employed as draftsman in the Bridge and Construction Department, Pencoyd Iron Works. He again entered railway service in June, 1894, with the Bridge Department of the Baltimore and Ohio R. R. where he remained continuously, holding the positions of inspector, assistant to the engineer of bridges and buildings, assistant engineer in chief, bridge draftsman and assistant engineer of bridges.

Mr. Edwards is a member of the American Society of Civil Engineers, the American Railway Engineering Association, the American Society for Testing Materials and the American Railway Bridge and Buildings Association.

Thomas B. Purves.

THOMAS B. PURVES, who has been appointed senior mechanical engineer for the Eastern District, Division of Valuation, Interstate Commerce Commission, with office in Washington, D. C., was born January 4, 1858, at

East Albany, N. Y. After receiving an academic education, Mr. Purves entered the service of the Boston and Albany Railroad as a machinist's apprentice and during his years of apprenticeship studied mechanical engineering under the direction of his father, who was at that time master mechanic of the Boston and Albany Railroad, which position he occupied for a period of forty years. At the close of his apprenticeship, Mr. Purves served several months as locomotive fireman in order to obtain experience in locomotive operation. He was then promoted, successively, to engine house foreman, general foreman and master mechanic, and finally to the position of superintendent of motive power and machinery, which position he resigned in 1904. During his service with the Boston and Maine R. R., he was elected to represent that company on the Board of Appraisal in determining the value of the Fitchburg Railroad, later leased by the Boston and Maine and his work in this connection received the marked approval of the presidents of both companies.

In 1906, Mr. Purves accepted a position with the Denver and Rio Grande R. R. as superintendent of motive power and machinery, which position he occupied until 1909 since which time he has been engaged with the Board of Railroad Commissioners of Massachusetts on the appraisal of the motive power and equipment of the New York, New Haven and Hartford R. R. Co., and of the Eastman, Heater Car Company and the Boston, Revere Beach and Lynn Railroad Company, for which work he proved to be peculiarly well fitted.

Examinations for Inspectors of Safety Appliances and Hours of Service.

THE United States Civil Service Commission announces open competitive examinations for inspector of safety appliances and inspector of hours of service for men only, on April 24th and 25th, 1914, at various important cities throughout the United States. From the register of eligibles for these examinations, certification will be made to fill vacancies in these positions at salaries of $1,800 per annum, with necessary allowances for expenses incurred while absent from headquarters in the discharge of official duties. It is expected that several appointments will be made to each position.

The duties of the Safety Appliance Inspectors will comprise the making of inspections and reports as required by the Safety Appliance Acts; the duties of the Hours of Service Inspectors will be the making of inspections and reports as required by the so-called Hours of Service Act. Both Safety Appliance and Hours of Service Inspectors may be required to investigate accidents as required by section 3 of the Accident Investigation Act of May 6, 1910.

Applicants must have reached their twenty-fifth, but not their fiftieth birthday on the date of the examination.

Applicants must be physically qualified to perform the duties required in these positions. An applicant whose medical certificate on the application form indicates that he is not in sound physical health will not be admitted to examination.

It must be shown in connection with his application that each applicant is (a) a person of good moral character and habits, active, intelligent, and discreet; (b) of good speech and manner, and qualified to address and confer with railroad officials and employes as occasion may require.

An applicant for the position of Inspector of Safety Appliances must have had at least eight years' experience in steam railroad service as conductor, engineer, trainman, yardman, fireman, or yardmaster, or at least five years' such experience as manager, general or division superintendent, trainmaster, master mechanic, master car builder, general car foreman, road foreman of engines or air-brake supervisor, and must within two years next preceding the date of his application have been in active service in one or more of the capacities mentioned, or as an inspector of steam railroad equipment under the Government of the United States or any State or Territory, provided he has had experience in any one or more of the positions above referred to.

An applicant for the position of Inspector of Hours of Service must have had at least eight years' experience as trainmaster, yardmaster, train dispatcher, telegraph operator, block signal operator, conductor, engineer, fireman, trainman, or yardman, or at least five years' experience as manager or as general or division superintendent, and must within two years next preceding the date of his application have been in active service in one or more of the capacities mentioned, or as an inspector of steam railroad equipment under the Government of the United States or any State or Territory, provided he has had experience in any one or more of the positions above referred to.

No person interested either directly or indirectly in any patented article required to be used on any locomotive or car under inspection, or who is intemperate in his habits, shall be eligible for appointment to either of these positions.

Commission May Curb Parcel Post.

IN response to resolutions adopted and forwarded to him by the Merchants' Association of New York, protesting, and asking his assistance against such further extension of the parcel post as would deprive the merchants of the service now furnished by the express companies, Commissioner E. E. Clark intimates that the Commission may, in the future, exercise its prerogative to prevent harmful proposals of the Postmaster-General. The Commission's letter is as follows:

"I have yours of the 12th, enclosing pamphlet issued by your Association 'against further extension of the parcel post service.' You say that you send this 'inasmuch as the Interstate Commerce Commission is charged by law with certain powers of review of the action of the Postmaster General relative to the scope and rates of the parcel post service.'

"In order that there may be no misunderstanding, I call attention to the fact that that statement of our powers is not quite correct. We have no power to review any action of the Postmaster General. He is required to secure the consent of the Commission to proposed changes in the regulations governing the rates, weight, limits, zones and conditions of mailability under the parcel post. The power of the Commission seems clearly to be limited to either granting or withholding that consent.

"The views of your Association are entitled to careful consideration and great weight, and I thank you for sending these expressions to us. They will have full consideration in any connection where they are applicable."

LEGISLATION.

Government Ownership of Telephone and Telegraph Lines Again Recommended.— The Postmaster-General has made public an elaborate report prepared for him by a special committee charged with that duty, in which it is stated that the telegraph and telephone systems have long been recognized as necessary adjuncts to a complete postal service and recommending that these lines be taken over by the Federal Government.

Theodore N. Vail, president of the American Telephone and Telegraph Company, in the annual report to stockholders made public a few days after the publication of the Post Office Department's special report, sums up the attitude of his company towards this subject in the following manner:

"Our opposition to Government operation and ownership is not based on pecuniary, partisan, prejudiced or personal reasons. It is because of our interest in the upbuilding of a great public utility and its preservation.

"We are opposed to Government ownership because we know that no Government owned telephone system in the world is giving as cheap and efficient service as the American public is getting from all its telephone companies. We do not believe that our Government would be any exception to the rule."

He states that the common impression that the Postmaster General has made a report favoring the acquisition of the wire lines is erroneous. It is not a departmental report, he says, but merely the conclusions of three officials of the Post Office Department, transmitted without comment by the Postmaster General.

As to possible Government purchase, Mr. Vail quotes Congressman Lewis, the Congressional exponent of Government ownership, to the effect that there is no water in the Bell capitalization; and urges the stockholders not to be induced to part with their holdings through fear of confiscation.

He shows that there is a deficit in all government-owned systems and says that every telephone system in the world adopts the Bell system as a standard, uses the Bell operating methods and either uses Bell apparatus or copies it. And yet there is not one, he continues, that gives an approximation to the facilities that the Bell system gives or gives as good or as cheap service, all past prophecies to the contrary notwithstanding.

"These deficits are not the result of a definite policy to give a cheap service to individuals at the cost of all, but are due to errors in management such as underestimates of values and cost of new construction; disregard to maintenance, depreciation and particularly of obsolescence; impossible theories of operation, and a mistaken policy founded on promises, prophecies and assertions exactly the same in character as those now being used to bring about Government ownership in this country, and upon a failure to understand and appreciate the advantages of private as distinguished from government organization.

"There are no sound reasons given," says the report, "or real advantages promised for government ownership and operation which do not apply to or cannot be secured by government regulation.

"Private initiative, invention, risk, spurred on by the incentive of reward, have changed the face of the world, and the resulting unearned increment largely constitutes the wealth of nations; without it many of the great scientific industrial developments would have remained scientific curiosities, even if they had been evolved at all."

The advantages of one telephone system are clearly set forth, as are the differences between the exact technical knowledge required for operation and the judicial ability necessary for regulation.

"Government administration," the report says, "is more or less a game of politics, and while with Government operation it may sometimes be possible to have efficiency, it will always be impossible to have economy."

The Economic Waste of Full Crew Laws.—A number of railroad officials appeared before Governor Glynn, of New York, during the early part of March in an effort to procure his favorable consideration of the repeal of the full crew law which has caused the railroads of that State $596,000 of useless expense since September 1st, last, or at the rate of $1,200,000 a year. In presenting the case for his system, President A. H. Smith, of the New York Central Lines argued in part, as follows:

"It must be apparent to all that the stipulation by law of the number of men who shall be placed upon a train which is a variable quantity and subject to variable conditions, will necessarily leave such mediums of transportation either under-manned or over-manned, and take away from the officer in charge the opportunity of exercising that judgment which is essential to securing proper results.

"Any man who is placed by law in a position where it is apparent to himself and fellow-workers that his services are unnecessary, is a menace to maintenance of proper discipline.

"The economic waste which has resulted from the enactment of this measure will fall as a burden upon the people, because in the last analysis the means of meeting the expense of such a requirement must be provided by the people.

"These railroads cannot go on and maintain their physical condition and keep pace with the natural business growth of the country unless the constant drains upon its resources are stopped or met by a corresponding increase in income sufficient to offset the expense incidental to such requirements.

"There will come a time when, if these increasing burdens continue to be placed upon the railroads, their physical strength as well as ability to render the service required of them, will be seriously impaired; and it must be evident to every thinking man that any diminution in the utility and efficiency of these great properties will, in the end, react not only upon the people served by them, but upon the entire business community.

"You have a Public Service Commission that represents the people, which is qualified to determine the matter of manning trains and to that body should be left this important question."

To Consolidate Trust Bills.— Reports from Washington state that the President has put his stamp of approval on the four bills to amend the anti-trust laws which the House Judiciary Sub-committee on Trusts submitted to him in a virtually final form. These bills, it is understood, will soon be reported to the House. President Wilson indicated his belief that it would be better to consolidate all the bills into one in order to expedite legislation. He insisted that the personal guarantee of individuals in control of corporations should be prescribed in every bill in order to break up the evils that have grown up under the present anti-trust laws.

The holding corporations bill would make unlawful those holding companies that combine the stock of corporations so as to lessen competition, but would not affect companies that hold the stock of corporations that form essential parts of their business. Holding companies that are entirely for investment and not for business directly, are not prohibited. This would permit companies like the big insurance companies to hold the stock of corporations which are not competitors. None of the four bills, as now framed, provides for exemption of labor unions from anti-trust prosecutions.

The trade relations bill prohibits manufacturers from contracting to prevent a merchant from handling a competitor's goods. It prohibits final price fixing to the consumer, though it permits the manufacturer or wholesaler to fix the price at which goods shall be sold in the first instance, as from manufacturer to jobber. Under this restriction, the first sale of a manufactured article by its producer would be at the same price everywhere, plus the cost of transportation. This bill gives the right of injunction to individuals for threatened loss or damage, and the right to make use of a Government decree against any corporation.

The interlocking directorates bill includes a provision to prohibit directors in various corporations selling to companies in which they are directors. The definitions bill embodies such definitions as seem not to have been covered by decisions of the courts.

President Underwood on Interlocking Directorates.—In a published statement relating to the proposed legislation to abolish interlocking directorates, F. D. Underwood, President of the Erie Railroad, has had the following to say:

The subject of interlocking directorates has been given undue prominence. There is yet to be shown an instance where damage has been done to stockholders, property or the public, through the medium of interlocking directorates, which is largely a bogie. The whole matter has been distorted and exaggerated. The fact that the Interstate Commerce Commission is vested with the power whereby the financial and other operations of the railroads are rigidly supervised minimizes the importance of directors. We can all agree that the principle that those who borrow or buy and those who lend or sell should not be vested in one individual.

The bill now under consideration goes beyond that, in that it denies the shareholders of a railroad their right to be represented by any person who is a director or officer of a bank, although the bank may have no dealings with the railroad company. This would appear to be an attack upon the rights of railroad stockholders, unjust in principle and discriminatory in character. It is natural for the shareholders of railroads to seek representative men to have charge of their property, and inasmuch as representative men are not infrequently bankers, the unfairness of the proposition is apparent, and this applies especially to foreign shareholders, whose only recourse is to have their interests protected and represented by men identified with their banking connections. On the other hand, banks are at times large creditors of railroads, and in that case it is but natural that they should seek to have a representative on the Board for obvious reasons. In the case of manufacturing concerns, its creditors are entitled to representation on its Board. Why discriminate as against railroads?

The bill further provides that no person who is interested personally, or who is a director or officer in the mining or selling of coal, shall be a director of a railroad company; for example, a person might be interested in the mining or selling of anthracite coal in Pennsylvania. At the same time he might be a shareholder of a railroad operating west of the Missouri River, and by reason of his being a shareholder entitled to a seat in its Board. It would be quite impossible for a railroad located as above stated to have any dealings, either directly or indirectly, with any anthracite coal operators.

It all comes back to the character of the directors. Men who are qualified to be directors are not over plenty, and must be men of probity and business experience. To deprive the shareholders of the services of such men is an arbitrary and unfair proceeding, not warranted by any past or impending conditions.

New York Chamber of Commerce Deplores Further Governmental Interference with Business.—A Committee of the Chamber of Commerce of New York, composed of leading business men of that city, has prepared a report which has been transmitted to the President of the United States and to Congress in which it is declared that "what business men generally desire, what industry most needs, is the certainty of a period of rest for the peaceful readjustment of all enterprise that is inconsistent with the accepted principles of law and ethics, and for the energetic advancement of all individual endeavor, free of any sense of repression, secure in a sense of liberty of action, and guarded from the danger that the disclosure of personal prerogative and private achievements would entail."

The report is issued in accordance with the action of the Chamber of Commerce, taken at a largely attended meeting held February 19th, the Committee being instructed to put the view of the Chamber in the form of a brief that would state the underlying principles that should govern the regulation of business. Speaking of the right of individual initiative and the danger of arbitrary interference with the right of the individual, the report says:

"The spirit of unrest has been said to largely spring not alone from unequal conditions of life but from what has been called the unequal distribution of wealth.

"Undoubtedly what has been meant is the unequal acquisition of wealth, but there will always be unequal acquisition of wealth as long as there is unequal distribution of brains, industry and thrift, and those are qualities of mind and character which no statutory laws can regulate or control, but the beneficent exercise of which unwise law can greatly restrict and discourage.

"Men having those qualities have ever been able to see and grasp opportunity, and men using them conscientiously have ever secured recognition among their fellows.

"To shackle the genius of this country, to limit individual freedom and initiative within the confines of parental government direction other than the well-defined limits now understood and recognized as inconsistent with moral law, modern ethics, and the public welfare, would be to set brakes upon the splendid spirit of our people by which all our achievements have been inspired, if not indeed to break down the march of progress, and to force us to the rear in that international contest for the world's business by which alone this country can continue to grow and reach the fruition of which there has heretofore been such ample promise."

Speaking of the general desire of business to conform with the provisions of the Sherman Law, the report states:

"It is a matter of public knowledge that those whose affairs are not yet in harmony with the interpretations of that law are voluntarily seeking to readjust their affairs in consonance with it without the expense, delays and convulsion created by legal processes."

The report of the Committee closes with a recommendation for the adoption of the following resolution:

"Resolved, That the Chamber of Commerce of the State of New York urges upon the President and upon the Congress of the United States that ample time be given for the consideration and discussion of these new proposals by all the people of the country, that provision should be made for taking testimony from business men and business organizations throughout the country whose activities prevent their appearing at Washington to express their views, and that whatever legislation may be formulated, action thereon be deferred to a later session of Congress, in order that there may be sufficient time for a clear apprehension and thorough discussion and a complete expression of opinion throughout the country, to the end that what shall finally be determined upon may be the product of mature judgment, and may be likely to inure to the benefit and not to the disadvantage of the interests of all the people."

President Loree on Interlocking Directorates.—On March 5th, L. F. Loree, president of the Delaware and Hudson Railroad, appeared before the House Judiciary Committee at Washington to protest against legislation which proposes to prohibit interlocking directorates among railroads and other large industrial corporations. Mr. Loree told the committee that the great railroad problem now is to make life as secure as possible.

"The board of directors is the connecting link between the multitude of corporate owners and the corporate property, the sole means by which the former exercises over the latter the ordinary rights of ownership," he said. "Any curtailment of the ordinary rights of a corporate owner freely to choose those whom he will support for directors and to vote for any person by whom he may wish to be represented in the directorate is a restriction on the power of owners to control their property.

"Every curtailment of ordinary ownership rights must reduce the attractiveness of the investment and so impair ability to obtain needed capital. The process may go far enough to cripple seriously the industry affected. The United States is not yet free from the need of resorting to foreign money markets to secure capital in excess of that their own citizens are able to furnish. In every such case the appeal for foreign support must be made through persons who have the confidence of the foreign investors or bankers."

President Loree said insurance companies, savings banks, trust companies and even endowed universities and charitable institutions are investors in American railroads, and if they are denied the right to place their authorized agents on the directorates as they find it convenient, they will regard the investment as less desirable.

Ralph Peters Opposes Five Cent Fare Limit for Steam Roads within New York City.—Ralph Peters, president of the Long Island Railroad has sent a letter to the Speaker of the New York Assembly and to the Lieutenant Governor of the State protesting against Senator Griffin's bill amending the railroad law so as to require a five-cent fare upon steam railroads within New York City, on the ground that the proposal is confiscatory and suggesting that the matter could be dealt with more properly by the Public Service Commission, which was created for that purpose.

The Long Island Railroad handled more than 40,000,000 passengers in 1913 with an average haul of less than fifteen miles and an average revenue of less than fifteen cents. If the amendment goes through, according to Mr. Peters, it will mean a loss to the road of more than $1,000,000 a year. The company operates 92 miles of steam road within the city. For the year ended December 31, 1913, the company showed a deficit of $977,984, as against $282,690 for 1912, and $657,955 in 1911.

Minimum Full Crew Laws.—On October 17th, the Special Committee on Relations of Railway Operation to Legislation, issued a bulletin containing an analysis and the text of the laws affecting the size of trains or switching crews, which have been enacted in the various States. This committee, from subsequent correspondence with the various railways of the country, has now ascertained the number of trains affected and the cost of this legislation to railway operation. In response to its inquiry, asking for information of this character, 163 roads having a mileage of 202,369 miles, replied. Of these, 65 roads, operating 31,673 miles, are not affected by this legislation, the other 98 roads report a total of 2,359,368 trains affected and a total estimated cost per annum of $6,800,729. The committee's statement is accompanied by the following interesting table showing the extent of the cost per annum to the railroads in the States involved in complying with these full crew laws.

MINIMUM (FULL) CREWS.

Estimated number of trains per annum affected by State Laws.

States having laws which affect train or switching crews.	No. of roads.	Freight.	Passenger.	Switch.	Other Trains	Total

*Details which comprised totals were not reported by some roads.

Extraordinary Action by New Jersey Legislation on Railway Passes.—If any railroad in New Jersey refuses to carry free within the State of New Jersey practically every office holder and many minor State employes, it shall be fined $10,000 for each such person ejected from trains after a refusal to pay fare—and this notwithstanding that the Supreme Court has decided upon constitutional grounds that a large proportion of these persons are not entitled to free transportation. If any railroad challenges the law to compel it to carry these persons free, and the challenge is sustained, the General Railroad Act, by which all railroads of New Jersey are regulated, and under which all railroad corporations within the last forty years have been formed, shall automatically be repealed and the charters of all railroads in the State incorporated under that Act shall become null and void.

The above, in a nut-shell, is what the substitute reported by the Judiciary Committee for New Jersey Assembly Bill No. 368 would provide for if enacted into law.

This Bill would make mandatory in New Jersey a practice absolutely forbidden by Federal law, and by the law in most of the States in the Union, and which is criminal in the State of New York. Its introduction follows a request made by the railroads that 137 officers and employes of the State, who, under a recent decision of the Supreme Court, were not entitled to ride free, should pay the proper railroad fare just as office holders in other States do, and as other citizens of the State of New Jersey do. The Bill gives a long list of the State positions for the holders of which it would provide free transportation in that State, adding somewhat to those mentioned in previous statutes.

While time of the legislators has been devoted to the introduction of such a ridiculous measure as that described above, the railroads have been unable to secure a respectful hearing in the New Jersey Senate or Assembly for their petition to repeal the Extra Crew Law, a measure that causes a wasteful expenditure on the part of the railroads in New Jersey. The railroads in the State have also been unable to secure the introduction of a Bill to repeal the State law compelling them to carry certain office holders as passengers free of charge.

Federal Regulation of Railway Securities.—B. F. Yoakum, chairman of the Frisco Board, has addressed the chairman of the Congressional Committee on Interstate and Foreign Commerce in response to the suggestion that he should express his views on a law requiring the approval of the Interstate Commerce Commission of securities issued by railroads. Mr. Yoakum said: "As long as fourteen years ago, I filed a document with the Interstate Commerce Commission, suggesting a plan for co-operation between the Government and the railroads. I am still of the same opinion, and believe the time is opportune for the establishment of closer working relations. There is no doubt as to the advisability of railroad securities being subject to the approval of some one established authority, either the Federal Government or the different States, some of which now have laws supervising their issuance. The approval of the Government would be preferable as to interstate railroads, and would simplify the work, both for the Government and the railroads. It would obviate the multitude of divergent views that might arise as to the necessity of issuing securities to carry on the work of development, additions and betterments asked for by interstate carriers.

"Together with the federal approval of securities there should be also a way found to establish effective co-operation between the Government and the railroads. Among other things this would lead to cheaper money for the railroads for the improvement of their property and facilities, and would enable them to more economically handle their freight and passenger business. The price of money to the railroads is just as much a factor in the cost of transportation as the price of coal and other things they must buy in conducting their business.

"If the government should approve a railroad security, it would in effect, morally speaking, indorse it, and this high approval of the issue should make such a bond sell at the lowest rate of interest current for gilt-edge securities, thereby reducing the cost of transportation. A quasi co-partnership without risk or cost to the government might be established through a federal license or charter involving a profit-sharing plan for such interstate railroads as prefer to operate under federal charter. A national charter need not interfere with the authority of State Railroad or Public Utility Commissions in supervision of interstate business, or State regulation, except as to the issue of interstate securities. These would come under federal supervision only, and the government would participate in the profits of the road under an equitable profit-sharing plan. The profits thus accruing to the government could be distributed for the benefit of the various communities served by such railroad, as for example, the up-keep of improved public highways."

ORGANIZATION NOTES.

Signal Honor Paid American Engineer by Foreign Organization.—The International Exhibition at Leipzig, Germany, has made its highest award and given a gold medal to Gustav Lindenthal, chief engineer of the East River Bridge Division of the New York Connecting Railroad, for the design and plans of that bridge. The plans, strain sheets, and all details were placed on exhibition at the request of the Exhibition authorities. The New York Connecting Railroad, upon which this bridge is located, is being jointly constructed by the Pennsylvania Railroad and New York, New Haven & Hartford Railroad Companies.

International Engineering Congress, 1915.—Rapid progress is being made in working out the final program of papers for the International Engineering Congress to be held in San Francisco in 1915.

The first volume of the publication of the Congress will consist of a series of articles descriptive of the various technical features of the design and construction of the Panama Canal.

This volume will constitute practically an official technical record of the gigantic engineering feat which is just nearing completion and will be of interest, not only to engineers but to laymen.

No similar volume has as yet been prepared upon the canal, nor is it probable that any such will be in the future. The advantage is being taken of the Congress to draw together under one cover in this way, the statements of the men who have been responsible for the work.

The program of papers for the various sections of the Congress is practically completed and notices of them will be published in the near future. Subscriptions to the Congress are being received daily and on March 1st, the number of enrollment was slightly in excess of 1200, of which over 200 are from foreign countries and about 1000 from the United States. Subscription blanks have been mailed through the various National Societies to many thousands of engineers in this country and through the foreign societies to foreign engineers. The response already received is very encouraging, but it is trusted that all engineers interested in the success of the Congress will not fail to send in their subscriptions as early as possible. Delay in so doing renders the task of the Committee of Management more difficult, and makes it impossible to form any just estimate of the receipts which may be expected and the number of copies of the volumes which have to be published.

February Meeting of Richmond Railroad Club.—At the February meeting of the Richmond Railway Club, Mr. J. A. Kinkead, New York sales manager of the Parksburg Iron Company, delivered an interesting address on Charcoal Iron Tubes. Mr. Kinkead quoted many eminent authorities in support of the durability and long life of these tubes compared with steel' tubes. He pointed out that charcoal iron, on account of its purity, is readily welded, making it an ideal material for safe-ending purpose. Furthermore, the welding temperature and the burning temperature, for the same reason, are widely separated and there is not the danger of burning that might otherwise follow. With steel the welding and burning temperature are close together and for this reason the safe-ending with steel is liable to be unsatisfactory, for, if the welding temperature is exceeded, the material is burned, a condition not generally discovered until the tube is in service.

He also asserted that charcoal iron tubes require less attention between runs. Referring to a large system on which the engines of five divisions were compared, he stated that on the divisions using steel tubes more than half the engines required work on the tubes, while on the divisions using iron, less than ten per cent required attention. Furthermore, on one division where both materials were used, practically every engine reporting serious trouble from leaking tubes running into one of the terminals, was equipped with steel tubes.

Mr. Kinkead asserted that there was economy in the use of charcoal iron boiler tubes for the following reasons:

First—Purity of the iron and freedom from segregation insure greatest resistance to pitting.

Second—Slat coating protects fibres of iron and insures greatest resistance to corrosion.

Third—Works readily. Welds readily. Wears indefinitely. Does not deteriorate in service.

Fourth—Is not crystalline. Does not crystallize with use nor abuse.

Mr. Kinkead illustrated his talk with a number of stereopticon views showing the different stages in the manufacture of tubes from the raw material to the finished product.

Change in Meeting Place of Association of Transportation and Car Accounting Officers.—The Association of Transportation and Car Accounting Officers recently issued a circular announcing a change in place of the June meeting, from Savannah, Georgia, to Atlantic City, New Jersey. It has now been decided to change the date of the meeting from June 23-24 to June 18-19. This was found to be necessary in order to secure suitable hotel accommodations. The meeting will be held at the Hotel Chalfonte, Atlantic City.

February Meeting of Canadian Railway Club.—At the February meeting of the Canadian Railway Club, John S. Hall, student in the Department of Railways of the McGill University, Montreal, spoke on "The College Man and the Railroads." He pointed out that as far back as 1896, the college student as a special apprentice has variously engaged the attention of the master mechanics where he has come in for a lot of adverse criticism, mingled sometimes with a certain amount of praise.

Mr. Hall pointed out that the principal charge most people had against him was that he did not have enough practical experience. He has also been accused of thinking he knows too much and that he was on personal supposition and intellect, much above those who were around him. Mr. Hall's contention is that too much is expected of the special apprentice and that he in turn, expects too much from his employer.

After citing a number of criticisms by prominent railroad men to the effect that special privilege training was fundamentally wrong, he calls attention to the fact that three large and representative railway systems are at the present time building up and engaging in such special training. In reply to the criticism that most college professors do not know what to give their students, he points to the teaching staff of the Department of Railways at the McGill University, every railway subject being handled by a practical railway man.

Mr. Hall pointed out that the vexing question of practical experience for special apprentices naturally turns on the query: "What is the right length of time to put in?" The Canadian Pacific-McGill University answer is two years after graduation.

Someone is quoted as saying that the college man has not an intimate enough knowledge of the men in the ranks, and that when he is in the ranks he is favored to the detriment of the other apprentices.

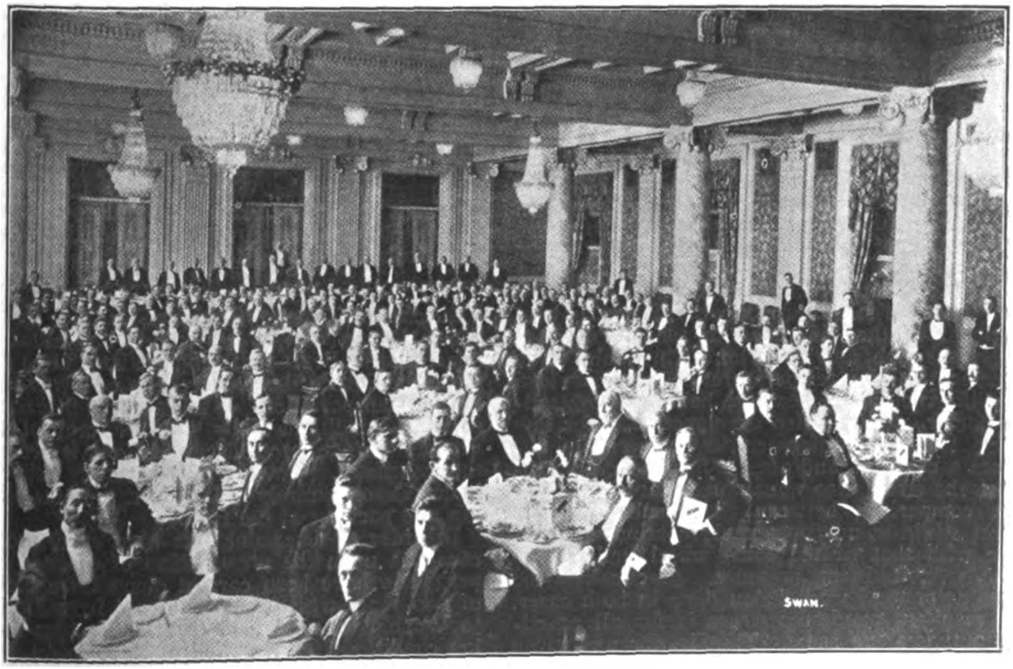
It must be admitted, that, at first, the college man does not have the desirable knowledge of his fellow-workers so essential to success, but, it is just this failing which a rational apprentice course is expected to correct. The man is brought right into contact with the actual condition, and what is more, he is generally placed in this position at a time when it is likely to impress him most. Of course, getting back to first principles, everything depends upon the man himself.

The mistake—and mistake it is—favoring the Special Apprentice to the detriment of the rest of the shop has fortunately been avoided here. The company would not be so foolish and the student himself is carefully warned to avoid it.

There is one thing, however, that appears a little unreasonable, and that is the tendency a great many people have of comparing college graduates immediately with a man generally older and who possesses more experience. They ask why are not college men as good as round house foremen. As a matter of fact, there are a number of graduates who have made good as round house foremen, but it seems a little hard to expect a man with little practical experience to at once measure up to another who has been a number of years on the job. Four or five years after graduation should be the time for considering their respective efficiency.

No college man, if he has truly had regard to himself, will desire to offensively override the opinions of others. But, of course, there are poor college men, just as there are poor railroaders or poor farmers, but we would ask you to seek out the average individual before passing judgment on the whole class.

Tenth Annual Electrical Night of the New York Railroad Club.—The New York Railroad Club held its tenth annual electrical night on the evening of March 20th, at the building of the United Engineering Society. Mr. E. Huberstockar formerly general manager of the Oer-



THE CANADIAN RAILWAY CLUB'S 12TH ANNUAL BANQUET, JANUARY 30, 1914.

likon Works, and now consulting engineer for the Swiss Government and in charge of electrification work for the Gothard Tunnel and also for extensions in the Simplon tunnel, was present and exhibited a number of interesting lantern slides showing the developments in this important work. Prominent electrical engineers summarized the present conditions in railway electrical development in the United States, and short talks were made on certain phases of the work such as electrical safety devices, interference of high tension lines with telephone lines, etc.

Conventions Booked for Panama-Pacific Exposition.—The number of congresses and conventions booked to meet in San Francisco during the Panama-Pacific International Exposition has been swelled to 219, according to James A. Barr, chief of the Bureau of Conventions and Societies. Of these organizations 24 are international congresses and 170 are national conventions with a delegate strength of from 200 to 40,000 each and each will remain in session from four to fifteen days.

March Meeting of Western Railway Club.

LOUIS E. ENDSLEY, professor of railway mechanical engineering at the Purdue University, delivered an interesting address before a meeting of the Western Railway Club, held in Chicago on the evening of March 17th, his subject being "Report of Tests to Determine the Stress in the Plate of Cast Iron Wheels Due to the Heat Produced by the Brake Shoe." The Master Car Builders' brake shoe testing machine was employed in making these tests. By its use, a standard brake shoe may be made to act upon the face of a revovling car wheel mounted upon the same axle with a heavy flywheel, until the whole system is brought to rest. A double cylinder steam engine serves to revolve the machine and the pressure with which the shoe is made to act upon the car wheel is regulated by weights applied to a system of levers, while the tangential pull resulting from the application is recorded upon a paper scroll by an Emery testing machine. The machine is also equipped with a special apparatus whereby it may be run steadily at a given speed, the shoe being automatically applied and released.

For the purpose of determining the stress in the plate of the wheel a Berry steam gauge was employed.

In a general way, the results of the test show that the stress for any given wheel is nearly proportional to the difference in temperature between the hub and the rim. This holds true whether the rim temperature be high or low, the difference in temperature being the controlling factor. It was also developed that for any given test this difference in temperature becomes a constant, and after it has become a constant, the stress also remains constant.

A comparison between the results for any wheel while using 800 pounds continuous pressure with that of the same wheel under 6,840 pounds intermittent pressure, practically the same amount of work being done in both cases, the resultant maximum stress is for all practical purposes the same. That is, for any given wheel the stress set up in the plate of the wheel is almost proportional to the amount of work done by the brake shoe in a given time. The thing which affects this stress in the plate most is the design of the wheel.

Professor Endsley's article was accompanied by a number of diagrams and tables illustrating in a thorough manner the results of the various tests made.

TRAFFIC.

February Anthracite Shipments.—Shipments of anthracite during February were the smallest for that month since February, 1905, and 1,552,718 tons less than in February, 1913. They amounted to 4,121,451 tons as against 5,674,169 tons the previous year. The shipments of anthracite in January and February combined were 2,713,405 tons less than in the corresponding months of 1913. The moderate weather this winter with only a few cold snaps of short duration is the explanation of the small shipments. None of the companies shipped as much as a million tons. The Philadelphia & Reading led in tonnage with 746,793 tons; the Lehigh Valley was second with 681,844 tons; and the Lackawanna was third with 573,553 tons. The Central Railroad of New Jersey carried 563,650 tons, the Erie 533,307 tons, the Delaware & Hudson 442,378 tons, the Pennsylvania 426,100 tons and the New York, Ontario & Western 153,826 tons.

California Celebrates Orange Day.—On March 21st, orange day was celebrated throughout the citrus fruit belt in California. All railroads operating in the far West gave particular prominence to the day by the employment, wherever possible, of the yellow fruit in restaurants and dining cars and the local offices of these lines also advertised the day by giving away paper likenesses of the fruit and literature explaining its value as a health food. A. Waldbauer, the energetic general agent of the Kansas City, Mexico and Orient Railway at Pittsburgh, slipped one over on the fraternity of Western representatives in that city, by being the only one handing out real samples of the California grown fruit. He and his office force spent the day receiving railroad friends and the public calling in response to invitations to drop in and get a real sample of the sunny groves. Appreciating the opportunity, Mr. Waldbauer had had a consignment sent him direct from California over the Orient's "orange" special that delivers the fruit from the groves ten days after picking.

Successful Orange Shipping. — The United States Department of Agriculture has issued an interesting bulletin regarding methods to be employed to insure the preservation of citrus fruit during transportation. It is estimated that under existing conditions fully ten per cent of the Florida orange crop decays before it reaches the consumer. This, the Department believes, is due almost entirely to lack of care in the picking and packing of the fruit.

In order to determine just what effect proper care has upon the preservation of oranges, experiments have been carried along for a period of two years with oranges shipped from Florida to Washington and held there under open market conditions for a period of three weeks.

Each shipment consisted of six boxes, two handled entirely under the direction of the investigators, two picked in the regular commercial way but graded and packed with special care, and two taken at random from the ordinary run of shipments. The following table shows the results of this investigation, the different percentages of decay at the end of the three weeks being particularly impressive:

BLUE-MOLD DECAY IN ORANGES CAREFULLY HANDLED AND COMMERCIALLY HANDLED ON ARRIVAL IN WASHINGTON AND AFTER HOLDING FOR THREE WEEKS; SUMMARY OF THE RESULTS OF THE TWO SEASONS' WORK, 1910-1911 AND 1911-1912.

Time of Examination	Careful pick and pack.	Commercial pick and careful pack.	Commercial pick and pack.
	Per cent	Per cent	Per cent
On arrival	0.6	2.0	5.5
After 1 week	1.0	3.3	8.8
After 2 weeks	1.5	4.5	11.8
After 3 weeks	2.1	5.8	14.2

From 79 comparable shipments made in 1910-11 and 65 comparable shipments made in 1911-12.

In securing these results no methods beyond the reach of commercial growers were employed. Indeed, a number of commercial houses secured results almost as satisfactory as the investigators and one packing house reduced the average decay in its shipments from 15.8 per cent in 1910-11 to 4.1 in 1911-12.

The secret, the investigators find, lies in the prevention of blue-mold. "An injured orange," says the bulletin, "whether grown in California or in Florida, will decay whenever the conditions for the development of blue-mold are favorable. A sound orange in good healthy condition, whether grown in California or in Florida is able to resist blue-mold decay."

Every orange man knows blue-mold when he sees it. It is caused by the growth of a minute organism within the tissues of the fruit, but this organism cannot penetrate the sound living tissue of a well-grown fruit. Before the disease can do harm, therefore, there must be a break or an abrasion of some kind in the skin of the orange. This is why full value for the crop can be obtained only by the most scrupulous care in picking and packing. Heat and moisture help the mold to grow in injured fruit; sound fruit will withstand the most unfavorable weather conditions.

Foreign Commerce for the Fiscal Year.—According to the Department of Commerce, the foreign commerce of the United States made its highest record in the fiscal year 1913. Imports, both free and dutiable, were larger than ever before, and exports, both domestic and foreign, were also the largest on record. Imports were 1,813 million dollars, against 1,654 million in the fiscal year 1912, and exports were 2,466 million dollars, against 2,204 million in 1912.

The Pacific Coast Cantaloupe Crop.—Reports from the Pacific Coast indicate that the cantaloupe crop of that section will greatly exceed that of any previous year. Beginning with small amounts sent out by express a few years ago, Pacific Coast cantaloupe shipments have gradually grownun til last year it took 3,500 cars to handle them. A conservative estimate by the general manager of the Pacific Fruit Express places this year's shipments at over 5,000 cars, which will begin to move about May 20th. In handling this traffic, all cars are iced twice at the initial shipping station and from six to eight times on the way east. An average of eight tons of ice per car is required before the shipment begins to move. The Southern Pacific and the Pacific Fruit Express will require about 45,000 tons of ice to get the cantaloupes to market.

The Extent of Anthracite Coal Mining.—The vastness of the anthracite coal industry is interestingly indicated in the statement that the amount of coal mined together with the rock and refuse which must also be lifted from the mines, aggregates a total annual cubic yardage of excavation equal to, if not greater than, the total yardage excavated in the digging of the Panama Canal. In other words, the average yearly excavation of coal during the years 1904 to 1913, inclusive, amounted to at least 90,000,000 cubic yards, the rock and refuse equalled 100,000,000 cubic yards, while the gigantic strippings, estimated by one contractor at 12,000,000 cubic yards a year, and the miles of drainage tunnels cut through the solid rock easily bring up the total annual cubic yardage of excavation to that which was originally estimated as necessary in the digging of the Panama Canal, namely, 195,323,000 cubic yards. When it is appreciated that this amount of work is performed yearly in order to supply the demands of the anthracite coal industry, it is little to be wondered at that the supply of this valued mineral cannot be expected to last indefinitely.

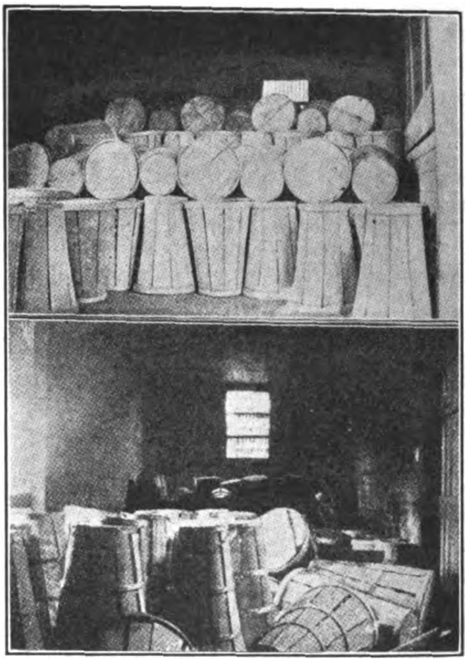
Early Crops in the South Damaged.—Reports from the South indicate that considerable damage occurred to early crops in Florida and Georgia on account of the severe frosts prevalent in these States on March 1st and 2nd. In some places, on the lower coast of Florida, the temperature went as low as the freezing point, doing great damage to various vegetable crops. The truck lands from Miami to Fort Lauderdale, lost from sixty to seventy-five per cent of their crops and it is reported that the recent frosts were the most destructive that have visited this section in twenty-four years. The West coast of Florida was not damaged to any great extent.

Decrease in Iron and Steel Imports.—It is a matter of considerable surprise to those who had expected a different outcome, that imports of iron and steel in the United States during the first four months, or since the enactment of the present tariff law should show a decrease of nearly $1,000,000 when compared with those of a like period a year ago. For the period from October 4, 1913, to the end of January last, the total was $10,219,000, compared with $11,077,000 in a like period ending with January, 1913. Most of this decrease occurred in the last month of the period under review; October showing a decrease of $199,000; November, a decrease of $298,000; December, an increase of $166,000; and January, a decrease of $526,000 in comparison with the respective months of the preceding year.

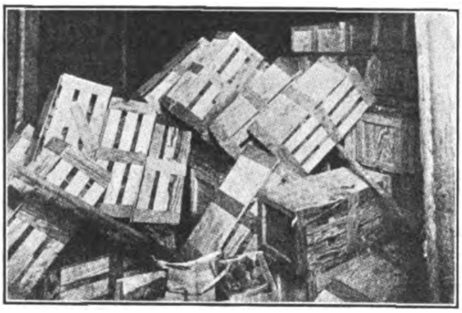
Decreased imports, according to compilations of the Bureau of Foreign and Domestic Commerce, Department of Commerce, are shown to have occurred during January in nearly all classes of iron and steel except cutlery, tin plates, and bar iron.

Imports and Exports for January.— Detailed figures of the imports into and exports from the United States for January and the seven months ended with January, 1914, published by the Department of Commerce, show imports in January approximating $154,400,000 and exports slightly in excess of $204,100,000 a total trade of a little over $358,500,000. In the seven months' period ended with January, 1914, imports were a little below $1,067,900,000 and exports were something more than $1,522,100,000, an aggregate trade in excess of $2,590,000,000. The trade balance favoring the United States is about $50,000,000 for the month of January, 1914, and for the seven months ended January, 1914, exceeds $454,000,000.

The Proper Loading of Perishable Merchandise.—The Georgia, Southern and Florida Railway Company which transports large quantities of garden truck to fruits to Eastern markets, has issued a circular containing rules governing the proper marking and loading of perishable freight which should prove of interest to all those engaged in the movement of fruits and vegetables. This circular contains a number of extremely interesting photographs showing the right and wrong way of loading merchandise of this character.

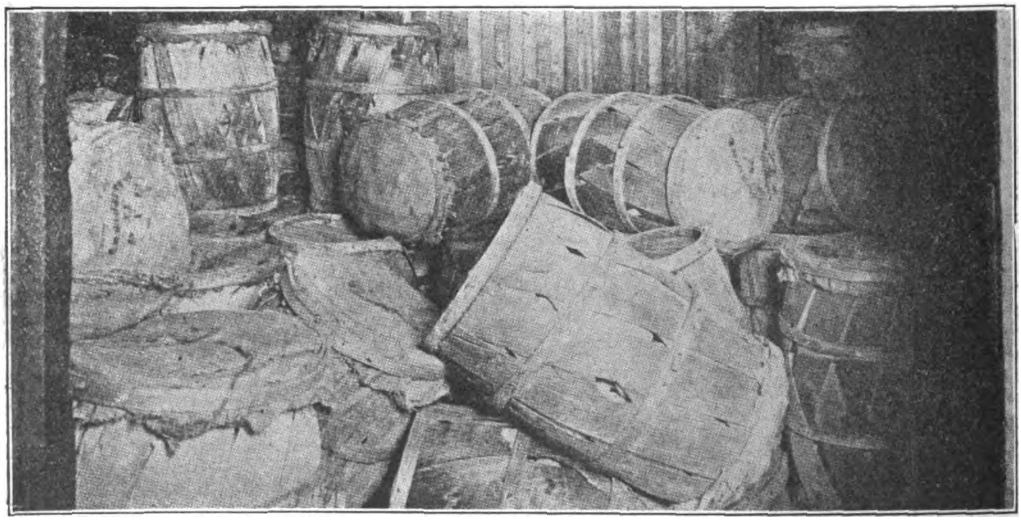


WHEN A CAR IS LOADED AS SHOWN IN UPPER PICTURE, THE PACKAGES USUALLY ARRIVE AT DESTINATION IN THE CONDITION SHOWN IN LOWER ONE. THE VACANT SPACE LEFT IN THE DOORWAY SELDOM FAILS TO GET IN ITS WORK.

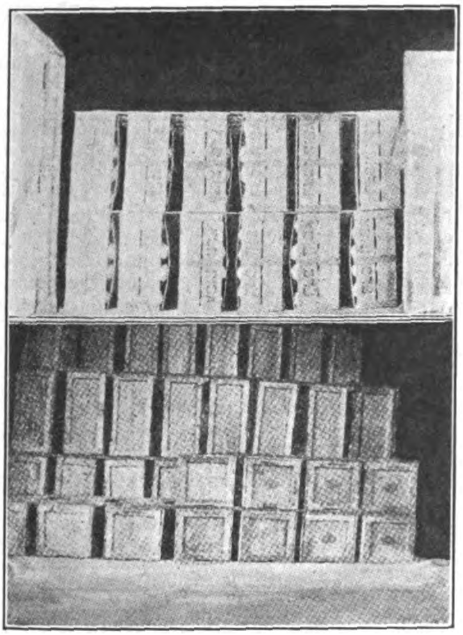


CONDITION OF CAR OF PEACHES UPON ARRIVAL AT DESTINATION, DUE TO IMPROPER LOADING.

The circular calls attention to the fact that under no conditions should the doorway of the freight car be left clear unless the bottom tiers



THE RESULT OF SHIPPING BARRELS OF POTATOES ON ENDS, WHEN THE BARRELS IN SECOND TIER ARE NOT BRACED AND ALL THE DOORWAY SPACE IS NOT FILLED.

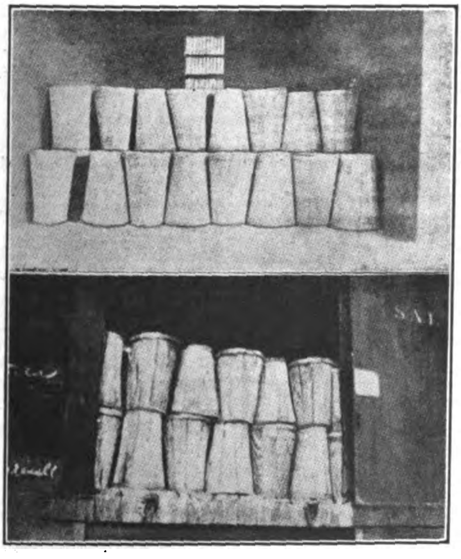


Examples of Proper Loading.

The first represents car of grape fruit; the second car of beets and tomatoes.

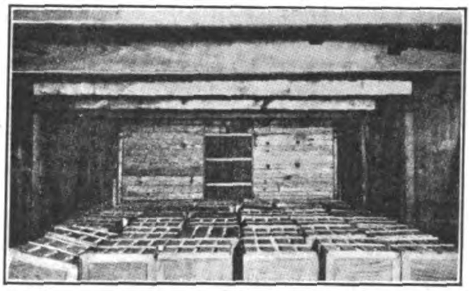
of the packages are securely braced and all other tiers secured or "stepped down" to protect packages against falling. Among the loading suggestions which are intended for shippers loading carload shipments and for agents consolidating less carload shipments into solid cars, are the following:

(1) If space in the doorway of car is not used, the bottom tiers or packages should be securely braced and all other tiers braced or "stepped down" so it will be impossible for a package to fall from its original position.



First picture shows car partly loaded with hamper baskets containing cucumbers.

Second picture shows car fully loaded with entire floor space covered.



Well loaded car of peppers and tomatoes.

(2) The entire floor space should be covered by the bottom tier and all other tiers securely braced or "stepped down" so that it will be impossible for a package to fall from its position.

(3) The entire floor space should be covered by two or more tiers and the remaining packages braced or "stepped down" so that it will be impossible for a package to fall from its original position.

(4) Packages should cover the entire floor space, tier on tier, as long as there are packages to make solid tiers. Odd packages left over after completing the last full tier must be distributed over the top tier resting on their broadest surface to prevent their toppling over.

The accompanying illustrations give an excellent idea of the educational value of those found in the circular.

The South and the Panama Canal.—In addressing the Greenville (S. C.) Chamber of Commerce, on the evening of March 17th, Mr. Fairfax Harrison, president of the Southern Railway spoke on Southern Cotton Mill Development and Co-operation for a Broader Market for Southern cotton goods with special reference to the opportunities that would be opened up by the Panama Canal. He referred to the manner in which the supremacy in the manufacture of cotton goods in the United States was rapidly passing through New England to the South and in answer to the question as to how to give this tendency still further and larger expression, Mr. Harrison pointed out the opportunities that will be opened by the Panama Canal when he said:

"The men who are first on the ground will have an immense advantage over those who wait until ships are actually passing through the Canal before making a move. Let us in the South then take full advantage of our geographical opportunity and of a tendency of commerce in our favor, and, as the phrase is, beat the Yankees to it. We have in the past given them what the fashion now is to term 'fair competition,' and we should not forget that our fathers taught us to fight intelligently as well as gallantly for the Southland."

Mr. Harrison showed that of total importations of cotton goods into the Latin-American countries amounting to $102,067,180 a year, only about ten per cent were shipped from the United States as compared with more than fifty per cent from England, about fifteen per cent from Germany, and considerable quantities from other countries.

Speaking of methods of developing trade with the Latin-American countries and of the expense of individual effort, Mr. Harrison urged co-operative effort, and suggested a specific plan by which the Southern Railway Company could join with Southern manufacturers and Southern merchants in the expense necessary to initiate, direct and maintain a profitable current of competitive and peculiarly Southern commerce in this new channel.

He said that in anticipation of the completion of the Canal, the Southern Railway Company had already had a detailed report from a highly qualified expert which is full of valuable suggestion and that this information and such additional information as could be obtained by the Company from the various governmental offices in Washington was freely at the disposal of any one along the Company's lines who might be interested in the subject.

He spoke of the importance of direct and regular steamship service in the development of import and export traffic through the South Atlantic and Gulf ports and he emphasized the desirability of such co-operative and co-ordinate effort as he had suggested seeking the development of such a volume of business as will warrant the establishment of direct and regular steamship lines. He said:

"If this matter shall be handled intelligently and energetically by a small group of the interests concerned I believe it will be practicable to build up a substantial and profitable direct trade with the Latin-American countries and that no one will benefit more largely from this than will the Southern manufacturers of cotton goods.

STATE COMMISSIONS.

California.— The Railroad Commission has sustained the complaint of an apple-grower who was charged $1.75 a ton by the Southern Pacific for the transportation of apples to canners and $2.75 for apples for sale in the open market, and has ordered that the same rates be applied to all apples. The road contended that the grades of the fruit differed and the higher grade required a higher rate.

Canada.—The Canadian Railroad Commission has suspended the increased rates of fare in Canada for exclusive use of drawing-rooms and compartments of sleeping cars, pending investigation. In this they have followed the example of the railroad commission in the State of Washington, which has gone still further by refusing to allow railroads in the Northwest to enforce the new rule, which went into effect in March.

Illinois.—The Public Utilities Commission has suspended for 120 days the cancellation of through freight rates made by trunk lines entering Chicago in connection with the eight industrial lines in the city. This action leaves the old schedule in effect.

Louisiana.— So many complaints have been made against the new express rates in Louisiana that the State Railroad Commission has decided to investigate and consider all that are specific. They became effective February 1st and have caused much dissatisfaction, especially among shippers of produce. The Commission has started a hearing on the subject at New Orleans, and all the express companies have been notified to have their representatives present.

New Hampshire.— The State Public Service Commission has been asked to grant permission to the Boston & Maine to put in force the proposed increase in one-day passenger and mileage rates without waiting for the action of the Massachusetts authorities on the application to eliminate trip tickets. If the application, which is now under advisement, is granted, the present two cents a mile rate will be raised to a flat 2½-cent rate. The mileage rate would be raised from 2 to 2¼ cents. It is estimated that this would mean an increased revenue of more than $1,000,000 a year.

New York.—The Public Service Commission, Second District, has issued the following order authorizing the Buffalo, Rochester & Pittsburgh Railway Company to issue its five per cent series "H" equipment bonds of a total par value of $881,038.19 pursuant to certain indenture designated as Equipment Agreement Series "H" dated July 1st, 1913, with the Guaranty Trust Company of New York, Trustee. These bonds are to be sold at not less than 99.75 per cent of their par value and accrued interest, the proceeds to be used for the purchase of additional equipment.

Pennsylvania.—The Public Service Commission, March 30th, conducted a hearing in Philadelphia, in the case of the Monongahela Connecting Railroad, of Pittsburgh, against the Pennsylvania, Baltimore & Ohio and Pittsburgh & Lake Erie Railroads. The trunk lines had announced the abolition of their joint rate, to take effect April 1st.

The Monongahela officials protested that thirty days' notice of the change had not been given to the Commission, as provided for by law. They wanted time to submit their contention that the road is not an "industrial" or "plant" road, as it has been classified by the Interstate Commerce Commission, whose ruling was responsible for the determination of the trunk lines to abolish their rate agreements with such roads.

The Commission held that without thirty days' notice to it, the abolition of the joint rates would be illegal. This notice was held to be necessary in addition to the thirty days' notice to the public.

A number of other such roads as well as hundreds of shippers were represented at the hearing all asking that the order of the trunk lines be suspended and a date set for a later hearing when testimony could be taken on the propriety of the abolition of the joint rate.

The trunk lines were represented also. They requested that the joint rate be abolished April 1st, as planned. They contended that the notice of the change placed in their stations was sufficient notice to the Commission.

Tennessee.—Sweeping reductions of from 20 to 25 per cent are to go into effect on May 1st, in express rates upon merchandise packages in Tennessee, under an order of the State Railroad Commission. The express companies have accepted the changes and will prepare the necessary tariffs for submission to the Commission.

Washington.— The Great Northern Railway Company made application to the Washington Public Service Commission for permission to refund sums, totaling more than $500, to about fifty passengers, who the railroad management states, were overcharged. The application, the first of the kind ever filed, was granted immediately. It is the outgrowth of the blocking of the Great Northern line across the Cascades last October for repairs, when trains were detoured over the Spokane, Portland and Seattle and passengers from Seattle to Wenatchee were compelled to pay for the mileage of a haul to Spokane and back to Wenatchee and vice versa.

LEGAL.

Interstate Commerce Commission's Jurisdiction Over Rates Upheld.—Judge Adams in the United States Circuit Court at St. Louis, Mo., has rendered a decision to the effect that the Interstate Commerce Commission has exclusive jurisdiction over the regulation of interstate railroad rates. Judge Adams dissolved a temporary injunction restraining the Wabash Railroad from filing new rates for shipments from the Illinois Glass Works at Alton, Ill. Joseph W. Folk, chief counsel for the Commission, in commenting upon the decision, said that it would prevent shippers in the future from enjoining the enforcement of increased rates granted by the Commission. The Court held that it was for the Commission to decide whether a railroad was an industrial line or a common carrier and whether a railroad should file new rates.

Court Upholds Louisville and Nashville's Refusal to Permit Commission to Examine Files.—The Government has been refused a mandamus by Judge Evans in the Federal Court at Louisville, Ky., by which it desires to compel the Louisville and Nashville Railroad to give examiners of the Commission, access to all files and records. The decision of the Court holds that certain communications the railroad refused to produce, were privileged between lawyer and client; that the Hepburn Law does not give the Commission power to make general examinations, and that the inquiry in question is not along line sufficiently specific.

Decision Under the Hours of Service Law.—In the case of the Government against the Southern Railway in the District Court of the United States for the Western District of South Carolina, Judge Smith recently gave the following decision:

1. The occurrence of an accident or delay by the act of God, or of a casualty or unavoidable accident, while a train is in course of transit from one terminal point to another, does not suspend the entire hours of service act as to that train. The statute does not mean that as to a train so delayed the operative period of service is extended from 16 to 21 or 26 hours, according as some delay from the exempting causes may occur whilst the train is in transit.

2. The hours of service may be extended in such cases beyond the period fixed in the statute, only so far as may be necessary to permit the train to be operated to a point at which, due regard being had to all the circumstances of the particular case and the character of the train, the train crew could be relieved or be allowed to take the rest required by the statute.

3. When a freight train was reported at a way station to have already exceeded the statutory limit of service and there was no extraordinary exigency that required this freight train to go on to its final terminal, if the jury finds that such train reasonably could have been tied up at such way station so as to give the employes the rest required by the statute, the railroad officials were not justified in permitting them to continue to exceed the statutory limit of labor. If there has been a delay produced by justifiable causes at the time the train reached a way station, still if there was a point either at that station or some other where the train reasonably could have been tied up, or a new crew put on, the train could only be operated after the limit of sixteen hours until a suitable stopping place could be reached; and it is the railroad's duty to have suitable stopping places where rest can be had for its employes, at proper places along its road, proportionate to the exigencies of the business.

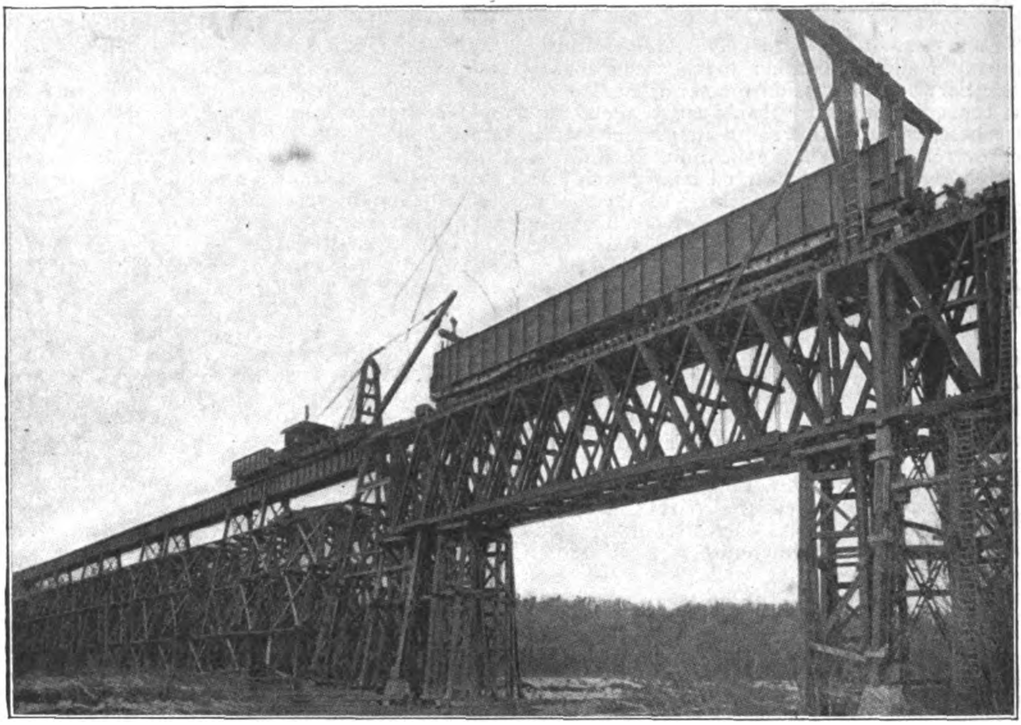
4. The same rule is laid down where train en route is reported at a way station when the period of service for the train crew is within a few minutes of the expiration of the sixteen-hour period and there is no reasonable expectation of being able to make the final terminal within the sixteen hours.

CONSTRUCTION.

Second Track for the Cincinnati, New Orleans and Texas Pacific Railway.—New second main track on the Cincinnati, New Orleans and Texas Pacific Railway between Sherman, Ky., and Dry Ridge, Ky., a distance of four miles, has just been put in service, completing a continuous double track stretch of 24.8 miles from Erlanger, Ky. Vice-President T. C. Powell announces that work is progressing on the second track under construction from Dry Ridge to mile post 37, a distance of 5.4 miles, and that, with the completion of this and other work, the C. N. O. & T. P. will have 37 miles of continuous double track from Ludlow, Ky.

Progress in Bridge Construction.— Railway bridge construction, like the construction of terminals, has shown remarkable progress during the past few years. This is strikingly illustrated by the accompanying photograph which shows a bridge span manufactured by the American Bridge Company, being placed in service on the Duluth, South Shore and Atlantic Railway's bridge near Shilo, Wis., on December 16th. This monstrous span which is 121 feet in length and weighs 108 tons, would have been considered a practical impossibility a few years ago, as even its manufacture would still have left it without means of transportation or erection. In this particular case, however, it was only a portion of a shipment of 93 cars of fabricated bridge material which this Company is using to replace as rapidly as possible the wooden trestles and trusses now in service.

The method of installing the span is of interest. As indicated in the photograph, it was assembled and bolted together on two standard steel flat cars and moved out to position on the



Placing an Enormous Bridge Span in Service on the Duluth, South Shore and Atlantic Railway.

old bridge by a derrick car at 7.30 A. M. This car on one end and gallows frame and falls handled by a hoisting engine on the other end, lifted the span clear of the cars which were then pulled out on to the wooden trestle, clear of the span. The deck of the old wooden span was then removed piece by piece and dropped into the river. This permitted the 108 ton steel girder span to be lowered into position, final connections being made at 2.30 P. M., the task of installation being completely accomplished in seven hours.

EQUIPMENT.

The Burlington's New Dining Cars.

THE Pullman Company has recently delivered to the Chicago, Burlington and Quincy, five new all steel dining cars, the basis of whose construction has been the Government's specifications for postal cars. Furthermore, the general design of these cars is such that it may be conveniently employed, with the necessary modifications, for any other passenger train cars.

The length of these cars is 79 feet 6 inches, making them the longest dining cars in existence, and they have a capacity of thirty-six peo-

ple an increase of 20 per cent over older cars. In following the Government's specifications for postal cars, the effort was to meet any possible future Government requirement for strength and character of material used in construction, everything having been made of steel with the exception of the chairs.

The lighting is of an indirect character and comes from sixty-six electric lamps located and concealed in glass covered troughs near the base of the deck sash. This system of diffused lighting eliminates shadows and closely approximates actual daylight.

A side door two feet four inches wide, opening directly into the kitchen, has been provided so that the car may easily be provisioned. The kitchen has been laid out according to the standard practice of the Pullman Company and is provided with all of the latest improvements.

Extension of Telephone Service on Southern Roads.— Vice-President Powell of the Alabama Great Southern Railroad and of the Queen and Crescent Route, announces that the telephone will be substituted for the telegraph in dispatching trains and handling messages on the entire line of 296 miles between Chattanooga and Meridian. The telephone has also been used for some time with great success on the Cincinnati, New Orleans and Texas Pacific Railway and will soon be in use over its entire length so that with its completion on the Alabama Great Southern, trains will be dispatched by telephone for the entire distance of 630 miles between Cincinnati and Meridian.

Ship Building in 1913.—The world's ship building results for 1913 clearly demonstrated the leadership of Great Britain as a tonnage producing country, the Clyde being easily the first and greatest of all ship building and marine engineering districts.

The total new construction for the year, according to Canadian Machinery numbered 3,936 vessels with a measurement of 4,267,166 tons, while there is recorded the remarkable total of 4,924,799 i. h. p. These figures show an increase over those of 1912 by 325 vessels, 500,000 measured tons and 677,000 i. h. p. The United Kingdom's share of the 1913 construction was 1,474 vessels of 2,263,933 tons and there were manufactured marine engines of 2,661,260 i. h. p. The great liners which were built during the year were as follows:

Vessel and Type.	Tons.
Vaterland, four screw turbine	*56,000
Acquitania, four screw turbine	†47,000
Columbus, twin screw turbine	‡35,000
Tirpitz, twin screw turbine	*21,600
Alastian, four screw turbine	§18,500
Galgarian, four screw turbine	§18,500
Cap Trafalger, three screw turbine	*18,000

Extending the Automatic Electric Block System on the Southern Railway.—Automatic electric block signals will be immediately installed by the Southern Railway on the double track line between Knoxville and Morristown, a distance of 42 miles and one of the most important lines on the Southern Railway System, as over it are handled the through trains between Memphis and New York, between New Orleans, Birmingham, Chattanooga and New York, and a large part of the travel to Asheville and other Carolina resorts.

The system will be of the most modern type and will greatly facilitate and safeguard traffic. It will be similar to that completed last year in North Carolina between Greensboro and Charlotte, and now being installed in Virginia between Alexandria and Orange.

LABOR.

Arbitration Board to Settle Disputed Interpretations.—The Arbitration Board which made the award in the recent Eastern wage controversy, involving the salaries of trainmen and conductors, have been called upon to consider complaints to the effect that a number of roads have misinterpreted certain provisions in the award. It has been agreed to both by the railways and the employes to abide by such interpretation as the Board may make of the disputed provisions.

LAND AND INDUSTRIAL.

The Railways' Part in Community Development.—In a recent address before the Selma, Ala., Chamber of Commerce on Railroad Co-Operation in Southern Agricultural Development, President Fairfax Harrison of the Southern Railway pointed out that, as a business enterprise seeking increased prosperity through an enlargement of its volume of traffic, a railroad may properly co-operate with the people whom it serves for community development. Mr. Harrison told of the organization of the Southern Railway Land and Industrial Department, and declared his purpose to continue this work and to give it close personal attention. He spoke of its special value in the pending revolution of agriculture in the South, brought about by the invasion of the Mexican cotton boll weevil, which, by enforcing the arguments of experts for diversified agriculture may yet prove a real educational force in the South.

Mr. Harrison cited the reports of the United States census of 1910, showing that at that time 2,571,734 natives of the nine Southeastern States traversed by the Southern Railway lines were living in other States, while only 472,412 natives of other States were living in these nine States, making the net loss of population to the section through the movement to other States 2,199,322, or approximately 61,000 more than the total population of Alabama in 1910. He said in part:

"In this connection, I would like to impress upon the Southern people my conviction that keeping our own people at home is even more important to our progress than attracting settlers from other localities. Through our Land and Industrial Department and all of our agencies working for Southern development, we are seeking to impress upon the people along our lines the superiority of our own section, and, so far as we are able to do so, we endeavor to persuade individuals contemplating removing to other parts of the country to remain in the South."

ELECTIONS AND APPOINTMENTS.

Executive.

E. R. Ackerman, member of the Board of Directors, Central Railroad Company of New Jersey.

W. H. Beardsley, president, Florida East Coast Railway. Headquarters, New York.

H. A. Butler, president and general manager, Mauch Chunk Switchback Railway.

M. L. Clothier, director, Lehigh Valley Railroad.

John W. Everman, president, Union Depot Co. Headquarters, El Paso, Texas.

Louis C. Fritch, assistant to the president, Canadian Northern. Headquarters, Toronto, Ont.

Carl R. Gray, chairman of the board and president, Western Maryland Railway. Headquarters, Baltimore, Md.

James S. Harlan, chairman, Interstate Commerce Commission.

Louis W. Hill, president, Great Northern Railway.

W. I. Jones, assistant to the vice-president in charge of traffic Missouri Pacific, St. Louis, Iron Mountain and Southern, Denver and Rio Grande and Western Pacific Railways.

William R. Kenan, Jr., vice-president, Florida East Coast Railway. Headquarters, New York.

J. M. Kurn, president, Detroit, Toledo and Ironton Railroad.

James T. Leary, controller, Baltimore and Ohio. Headquarters, Baltimore, Md.

Edward H. Lee, vice-president and chief engineer, Chicago and Western Indiana and the Belt Railway of Chicago. Headquarters, Chicago, Ill.

I. McQuiltin, vice-president, Carolina, Clinchfield & Ohio Railway. Headquarters, Johnson City, Tenn.

E. P. Ripley, president, Gulf & Interstate Railway of Texas.

James Russell, assistant to the vice-president, Denver and Rio Grande Railroad. Headquarters, Denver, Colo.

John Scullin, receiver, Missouri & North Arkansas Railroad. Headquarters, St. Louis, Mo.

James N. Wallace, director, Westinghouse Electric & Manufacturing Company.

Herman H. Westington, director, Westinghouse Electric & Manufacturing Company.

A. G. Whittington, second vice-president and general manager, International and Great Northern. Headquarters, Houston, Texas.

Legal.

Joseph W. Folk, chief counsel, Interstate Commerce Commission.

Joseph F. Gould, general counsel, Bangor & Aroostook Railway. Headquarters, Bangor, Me.

C. C. Huff, general attorney, Missouri, Kansas and Texas. Headquarters, Dallas, Texas.

Financial.

L. C. Haines, treasurer, Florida East Coast Railway. Headquarters, New York.

Charles N. Hebner, secretary, Illinois Public Utilities Commission.

Maury Middleton, assistant treasurer and assistant cashier, Southern Railway. Headquarters, Washington, D. C.

Accounting.

E. E. Hamilton, supervisor of operating statistics, Baltimore and Ohio Railroad.

W. B. Moss, assistant statistician, Norfolk & Western Railway.

Engineering and Mechanical.

F. Adams, division engineer, Texas and Pacific Railway. Headquarters, Alexandria, La.

C. E. Apple, supervisor of bridges and buildings, San Antonio and Aransas Pass Railway. Headquarters, Yoakum, Texas.

Charles F. Barnhill, master mechanic, Beaumont Division, Gulf, Colorado & Santa Fe Railway. Headquarters, Silsbee, Texas.

William Bartley, superintendent of car service, Lake Erie and Western Railroad. Headquarters, Indianapolis, Ind.

S. M. Bate, division engineer, Missouri Pacific Railway. Headquarters, St. Louis, Mo.

F. Bauer, assistant master mechanic, Cleveland-Indianapolis and Cincinnati-Sandusky divisions, Cleveland, Cincinnati, Chicago and St. Louis. Headquarters, Bellefontaine, Ohio.

F. V. Berkey, assistant engineer, Zanesville division, Central system, Pennsylvania Lines West of Pittsburgh. Headquarters, Zanesville, Ohio.

Wilbur M. Bosworth, mechanical engineer, Louisville & Nashville. Headquarters, Louisville, Ky.

C. A. Brandt, master mechanic, Chicago, Michigan and the Peoria and Eastern divisions, Cleveland, Cincinnati, Chicago and St. Louis. Headquarters, Indianapolis, Ind.

F. H. Buchanan, signal engineer, Pennsylvania Lines West of Pittsburgh. Headquarters, Pittsburgh, Pa.

Millard F. Cox, assistant superintendent of machinery, Louisville and Nashville Railroad. Headquarters, Louisville, Ky.

G. Davis, division engineer, Oklahoma division, Chicago, Rock Island and Pacific. Headquarters, El Reno, Okla.

Charles G. Delo, chief engineer, Chicago Great Western. Headquarters, Chicago, Illinois.

John Dickson, general master mechanic, Spokane, Portland and Seattle, the Oregon Trunk, Oregon Electric and United Railways. Headquarters, Portland, Oregon.

J. Dwyer, roadmaster, Portland Division, Spokane, Portland & Seattle Railway. Headquarters, Portland, Oregon.

G. F. Eberly, division engineer, Baltimore and Ohio Railroad. Headquarters, Wheeling, W. Va.

E. Gephart, supervisor of bridges and buildings, Northern and Southern divisions, Chicago & Alton Railroad. Headquarters, Bloomington, Ill.

R. P. Graham, assistant supervisor, Conemaugh Division, Pennsylvania Railroad. Headquarters, Philadelphia, Pa.

F. D. Griffin, assistant engineer, Gulf, Colorado and Santa Fe Railway. Headquarters, Dallas, Texas.

W. E. Guignon, division engineer, Zanesville Division, Central System, Pennsylvania Lines West. Headquarters, Zanesville, Ohio.

J. C. Haley, architect, Louisville & Nashville Railroad.

W. S. Hanley, chief engineer, New Orleans Great Northern Railroad.

H. H. Harsh, division engineer, Cleveland Division, Baltimore and Ohio Railroad. Headquarters, Cleveland, Ohio.

C. S. Heritage, engineer, Washington Terminal Company. Headquarters, Washington, D. C.

J. C. Hoehle, architect, Louisville and Nashville Railroad. Headquarters, Louisville, Ky.

W. W. Hubley, supervisor Division No. 26, Pennsylvania Railroad. Headquarters, Columbia, Pa.

J. B. Hutchinson, Jr., division engineer, Monongahela Division, Pennsylvania Railroad. Headquarters, Pittsburgh, Pa.

Jenks B. Jenkins, valuation engineer, Baltimore and Ohio System.

DIVIDEND NOTICES.

Office of The United Gas Improvement Co.

N. W. corner Broad and Arch Streets.

Philadelphia, March 11, 1914.

The Directors have this day declared a quarterly dividend of two per cent ($1.00 per share), payable April 15, 1914, to stockholders of record at the close of business March 31, 1914. Checks will be mailed.

LEWIS LILLIE, Treasurer.

UNITED STATES RUBBER COMPANY.

1790 Broadway, New York, April 2nd, 1914.

The Board of Directors of the United States Rubber Company has this day declared from its net profits a quarterly dividend of Two Per cent (2%) on the First Preferred Stock, a quarterly dividend of one and one-half Per Cent (1½%) on the Second Preferred Stock, and a quarterly dividend of One and one-half Per Cent (1½%) on the Common Stock of the Company, to Stockholders of record at 3 P. M., on Wednesday, April 15th, 1914, payable, without closing of the Transfer Books, April 30th, 1914.

W. G. PARSONS, Treasurer.

LEHIGH VALLEY RAILROAD COMPANY.

Philadelphia, March 18, 1914.

The Board of Directors of the Lehigh Valley Railroad Company have this day declared a quarterly dividend of two and one-half per cent (or $1.25 per share) on its preferred stock to stockholders of record, March 28, 1914; and a quarterly dividend of two and one-half per cent (or $1.25 per share) on its common stock to stockholders of record, March 28, 1914; both payable April 11, 1914.

Checks will be mailed.

J. M. BAXTER, Treasurer.

Hotel Gregorian,

35th St., Near Broadway.
NEW YORK CITY.

Famous for refined, homelike atmosphere and luxurious comforts at moderate prices. A few minutes' walk from Pennsylvania and New York Central Depots, immediately surrounded by leading theatres and retail shops.

300 Rooms with Private Bath
$2.00 to $4.00 per day.
Parlor, Bedroom, Bath, $4 up

Special terms for month or season. Restaurant Table d'Hote and a la Carte.

DANIEL P. RITCHEY, Prop.

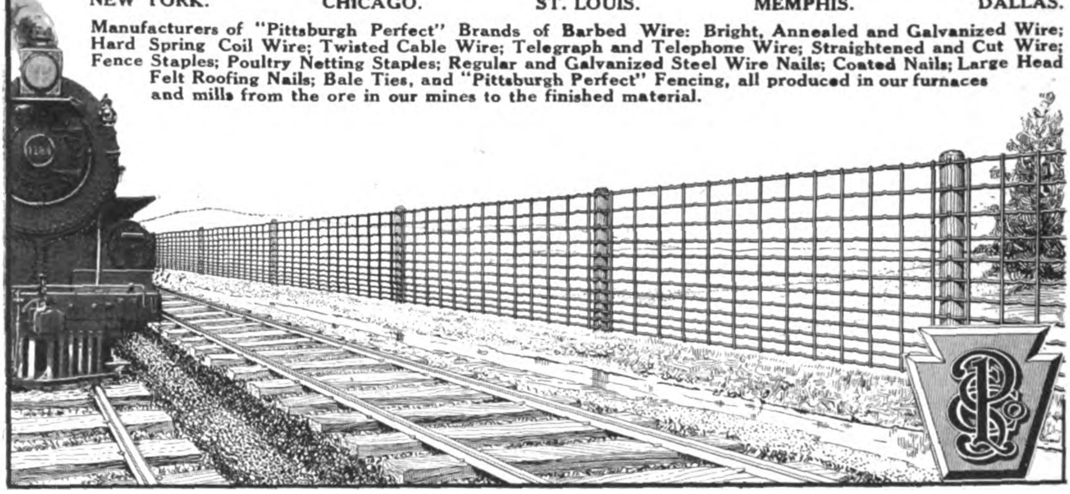
"Pittsburgh Perfect" Railroad Fencing

Bought by leading railroads of the United States and Canada because it excels in strength and durability, and affords perfect protection to the right-of-way. Made of special formula Open Hearth wire, **HEAV LY AND THOROUGHLY GALVANIZED.** ELECTRICALLY WELDED JOINTS. A one-piece fabric, easiest to erect. Write for catalogue and prices.

PITTSBURGH STEEL CO., PITTSBURGH, PA.

NEW YORK. CHICAGO. ST. LOUIS. MEMPHIS. DALLAS.

Manufacturers of "Pittsburgh Perfect" Brands of Barbed Wire: Bright, Annealed and Galvanized Wire; Hard Spring Coil Wire; Twisted Cable Wire; Telegraph and Telephone Wire; Straightened and Cut Wire; Fence Staples; Poultry Netting Staples; Regular and Galvanized Steel Wire Nails; Coated Nails; Large Head Felt Roofing Nails; Bale Ties, and "Pittsburgh Perfect" Fencing, all produced in our furnaces and mills from the ore in our mines to the finished material.



The Wooding Automatic Train Stop

This device is recognized by all Engineers as being far superior to any other.

It is operated by the **closed electrical circuit** which is the **only reliable means** for operating **any** automatic device. This necessitates a **contact.**

Our contact is a covered split rail. It is the **smallest,** gives the **greatest clearance,** makes the **best contact,** and is **weather-proof.**

The train contact is a strong **steel blade** that offers the **least** obstruction and **makes** the **best knife blade electrical connection.**

All agree that the **wrecks** on roads **equipped** with the **block signals are due** to the **human failure, demonstrating positively** the **reliability** and **necessity** for the **automatic train stop.**

Our Government for the people says through the Interstate Commerce Commission that the **automatic train stop** is the **only way to prevent wrecks.**

If indemnity in case of accidents can be secured against a railroad on the **ground** of **negligence** in not having the block signal installed, as shown in the February edition of the "Signal Engineer," **what chance has a road to escape** the **greater penalty** for not **installing** the **Automatic Train Stop which** is the **universally recognized protection?**

The automatic train stop has proven to be the **greatest desciplinarian. It protects** the **long faithful employes** from the **mistakes** they **naturally will make,** and the **employer** from the **loss** of **his best men** in trying to effect the **present day impractical** discipline.

Our device can be installed at a **minimum expense** in the **closed circuits** of the present day unreliable distant signalling system and **make** it **absolutely safe, or** independently, including local signals superior to the present block system, for **one-half** the **cost** of the latter.

This device is a **convenience,** and a **practical insurance against accidents** that **no railroad** can **afford to be without.**

We stand ready to demonstrate every claim made for our device on any railroad at our own expense.

Important Developments in the Transportation Field

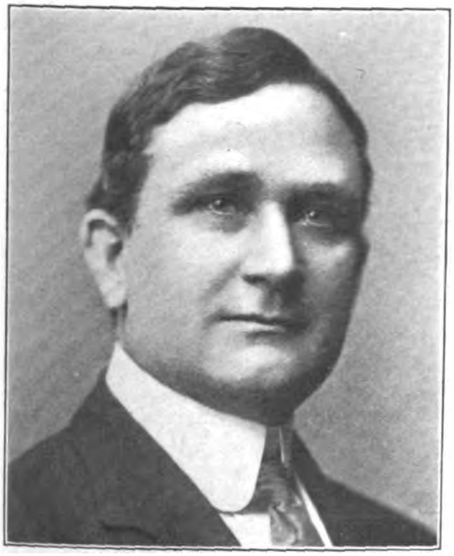
THE NECESSITY FOR THE RATE ADVANCE

Judged by expressions appearing in the daily press throughout the country, the Eastern roads have proved conclusively the necessity for the five per cent increase in their freight rates for which they have petitioned the Interstate Commerce Commission. They have presented an array of facts and conclusions which it is safe to say has convinced the majority of those who have followed the case that, due to larger operating expenses, caused by heavier taxes, higher wages, expensive regulation, greater costs for materials and other increased expenses which have been set forth in detail in the various statements presented to the Commission, net returns are no longer such as to permit them to conduct a progressive transportation plant to the best advantage of an expanding commerce.

George Stuart Patterson,

General Solicitor of the Pennsylvania Railroad, who addressed the Commission on "The Needs of the Carriers for Additional Revenue."

Even Louis D. Brandeis, the special counsel for the Interstate Commerce Commission, in his closing argument, directly admitted that railroad revenues were less than would be desirable, in fact, less than enough to guarantee the ability of the transportation industry to meet the increasing demands of the public. Mr. Brandeis, however, with his usual utter disregard to the practical features of the case, suggests that the railways increase their income by greater efficiency of operation, by further economy, by curtailing the multiplication of free service and by increasing, if necessary, the rates on the particular classes of business now handled at a loss.



J. L. Minnis

General Counsel for the Wabash, who presented a special argument in reference to the meaning and purpose of our national laws regulating railroads.

It is inconceivable that at this time the Commission will give serious consideration to such recommendations. They at least understand the urgency of the case, and appreciate its practical necessities. It, of course, lies within their province, and is, in fact, their duty, to gradually bring about such readjustments of rates as will establish a proper balance among the various industries of the country. This they have been doing for a number of years and must continue to do perhaps indefinitely, but to inject this consideration into the present controversy as a remedy for the difficulties under which the railways are now laboring, is to have but a small appreciation of the real requirements of the case. Everyone who knew Mr. Brandeis, or was familiar

George F. Brownell,

Vice-President of the Erie Railroad, who addressed the Commission on the economic justification for the increase in freight rates.

with his methods, expected he would revert to his pet hobby of greater economy or efficiency. He has, however, been largely discredited, so far as the practical application of his suggestions to railway operations are concerned, and the Commission is not likely to take seriously his recommendations.

The railroads appreciate, as does the Commission, that greater economy and greater efficiency are still possible in railway operations. In fact there are few branches of trade or business to which such a general statement does not apply with equal or greater force. Few doubt, however, that at the present time, the railways are making every legitimate effort to conserve their revenues, and no one but a desk economist would present such an argument as a remedy for the alarming depletion in railway net earnings of recent months.

Everything that experience and training can do to keep down railway expenses is now being done. In the meantime the entire country is suffering. The railways and their allied industries represent the biggest medium of exchange which the country has. This medium has become so impaired as to affect every part of the industrial fabric. Practically no new railway work is under headway or projected, supplies are being bought only on the basis of immediate necessities, and improvements have largely been abandoned until the development of more favorable conditions.

Whether the railways win their case or not, and it seems inconceivable that the Commission will not grant the relief asked, they have made a gain in public estimation which should stand them in good stead in future efforts to conduct an efficient plant. They have been absolutely frank in their public statements and, believing their cause to be just, have neglected no opportunity to inform the people regarding the true state of affairs. They have conducted an open, but aggressive, publicity compaign and have put their case before the bar of public opinion as well as before the Interstate Commerce Commission.

Public opinion has responded in a most encouraging manner, and is solidly behind the carriers in their efforts to procure a living rate. Certain politicians have attempted to deprecate these efforts, but as self-preservation is the first law of nature, their belated tirades have met with but little sympathy. As the Philadelphia *Ledger*, in an editorial of April 7th, puts it:

"One of the very best things the railroads have done recently was to inform the public about their own business. They did this through the issue of a great number of statements. It was a campaign of education that shed light upon rates and needs, wages and earnings, income and outgo, about which the public, which foots all the bills, was ignorant.

Louis D. Brandeis,

The Commission's Special Counsel, who admitted in his closing argument that railroad revenues were less than enough to guarantee the ability of the transportation industry to meet the increasing demands of the public.

"Senator LaFollette, who seems to regard a railroad as a public enemy, points to this campaign of enlightenment as a deep-dyed offense. He brands it as an attempt to sway opinion. He challenges the right of the carriers to present their own case in this frank and open manner.

"All the precedents are against the Senator. A murderer on his way to the gallows has the right of legal defense. The thief cannot be deprived of the privilege of every American to present his own side of the case.

"Private citizens may legally combat an increase in taxation or carry on a campaign for the protection of their own property. A manufacturer may rightfully antagonize tariff legislation that will jeopardize his own interests.

"Since when have the several million people who own American railroads been deprived of rights enjoyed by all other residents in this republic? Who took from them this privilege of being heard, guaranteed by the Constitution?

"In conducting their campaign of publicity the railroads have done exactly what the Senator himself has urged for political campaigns. A policy of silence in the present instance would have been imbecility. A couple of million property owners cannot be muzzled."

The railways have undoubtedly won their case before the bar of public opinion and it is to be hoped before the bar of the Interstate Commerce Commission. It remains, however, for the latter to rise fully to the occasion and grant the full five per cent increase which public opinion and fair dealing demand and upon which the prosperity of the country, in no small measure, depends. The conditions referred to by Mr. Brandeis and others are matters for future consideration and should not be permitted to confuse the real issue.

THE EFFECT OF A FAVORABLE DECISION

So far as railroad officials are concerned, the hope is generally expressed that the Commission will act favorably and promptly grant the full five per cent advance, or its equivalent. The belief is universal that the effect of such a decision will be most favorable, not only to the railroads but to general business. To be beneficial, however, it must be promptly granted and of such a character as to enable the carriers to begin to procure the benefits therefrom at once. It is believed by many that a ten per cent increase is really nearer what is necessary to permit the carriers to accomplish the best results both for themselves and the commercial and industrial interests.

CLIFFORD THORNE,

Chairman of the Railroad Commission of Iowa, whose injudicial attitude in connection with the advance rate case has led to wide spread criticism in the public press.

Nevertheless, the moral effect of a five per cent increase is fully appreciated and favorable action on the part of the Commission would undoubtedly encourage the railroads to modify their present policy of strict retrenchment. The railroads have now been waiting for months for a decision in the rate case and during this period, have been inactive along many lines. Favorable action is likely to mean almost the immediate contracting for or purchase of a large quantity of supplies and for renewed activity in the financial markets.

That which is hoped for from the rate advance, even more than the additional revenues to be procured, is the effect it will have upon the restoration of railway credit. Fresh capital is urgently required for facilities long neglected and for improvement and construction work which is being increasingly demanded as the months slip by. It has been variously estimated that the railroads require from $600,000,000 to a billion dollars yearly for additions, betterments and to maintain the standard necessary to economically and efficiently serve the public.

If a favorable decision by the Commission will re-establish railway credit to the extent that the tremendous amount of money needed the next few years for improvements and betterments can be procured, it is not hard to understand the vital effect of such action upon the prosperity of the entire nation.

It is no exaggeration to state that, at the present time, the business of the country is looking anxiously towards Washington with the hope that the Commission may find it possible to support the railways to the extent which will permit them again to become a stimulating influence in the financial and business world.

PUBLIC SENTIMENT AS REFLECTED BY CARTOONS

Another striking evidence in this change of public sentiment towards big business and the railroads is expressed in many of the cartoons which are appearing in the leading dailies.

It was only a comparatively short time ago when cartoons in support of these interests were so rare as to pass practically unnoticed. To-day they are appearing eveverywhere and they voice in no uncertain terms the antagonism which is rapidly developing towards constant and unnecessary interference with business by the Government. They may be likened to the handwriting on the wall of Biblical record which it would be well for the average politician to make an effort to interpret. The accompanying cartoons are fair examples of those which are appearing in a large number of dailies in many important cities of the United States.

THE HIGH COST OF RAILROADING

The high cost of living has hit the railroads, and has hit them hard, according to some recent figures issued by the Lehigh Valley Railroad. Taking a period of fifteen years, from 1898 to 1913, the Lehigh Valley shows with figures from its own books that all items of expense have increased astonishingly. In some cases expense has doubled.

Take the important question of the track. The maintenance of way per mile of track was $725.66 in 1898. Last year it was $1,524.13, more than twice as much. This is principally due to more expensive and heavier rails, ties that have almost doubled in price, heavier ballasting and the increased cost of labor. The necessity for a heavier track to carry heavier equipment has, of course, had something to do with it, and, then, again, creosoting ties has also doubled their cost, making the cost of ties to-day four times what it was fifteen years ago. Per mile of road the same proportion holds, the expense having jumped in fifteen years from $1,474.47 a year to $3,924.56.

A wooden passenger coach used to cost $8,000. The new steel coaches, which the Lehigh Valley is using, cost $12,000. Meanwhile, however, there is the undoubted assurance that they are safer.

A standard freight locomotive costs $25,000, where it cost only $15,000, in 1898. Repairs have jumped in proportion per locomotive from $1,508.05 a year to $2,692.36. This is largely offset, however, by the increased tractive power of the standard locomotive.

Where the high cost of railroading is most apparent though, is in general repairs and renewals. Here the increased cost of both material and labor shows convincingly. On a passenger car this item has increased from $510.27 to $824.15. On a freight car it is now $70.06, where it was $31.69 fifteen years ago. For locomotives there is the difference in the cost of upkeep between ten cents and four cents per mile.

In these items, labor, of course, is counted in. This has figures for all railroads as a ten per cent increase. In the operating of trains it is much more than ten per cent, however, as the engineers, conductors and trainmen have had the biggest increases in pay, and the full train crew bills in passenger runs increased the payroll by 40.2 per cent.

The interesting part of the comparison is that these extra expenses have been largely met by efficiency and better methods of railroading. It has been impossible to meet them entirely and that is why the railroads have been asking for a five per cent increase in freight rates, but it is remarkable how much the railroads have done in the face of the big expenses. As fast as they can, they are replacing wooden cars with steel cars, costing half as much again, their roadbeds are far ahead of what they were fifteen years ago, and anyone who ships freight knows that the freight service of today is so far ahead in promptness and certainty that there is no comparing it with fifteen years ago.

BUSINESS AND THE GOVERNMENT

There is a growing indication of a widespread antagonism among business men towards further interference with business by governmental authorities. The situation has become strained and the average merchant is beginning to feel the effect of the uncertainty which hangs like a pall over the entire country.

The present Administration, however, is showing no real inclination to lessen its field of activities, and this attitude, now that it is becoming more fully understood, has aroused a storm of criticism. Even the smaller business man is beginning to realize that unnecessary interference with big business has a direct bearing upon his welfare, and he is rapidly becoming more critical towards governmental activities.

The following paragraphs taken from a recent address delivered by Mr. Frank A. Vanderlip, president of the National City Bank of New York, at the dinner of the American Cotton Manufacturers' Association held in that city on April 27th, well summarizes the situation. As he points out, there is just one way to bring about a renewal of business prosperity and that is through a more enlightened public opinion, which will leave no doubt in the minds of legislators and regulators that business must be left free to develop along legitimate lines untrammeled by the red tape and bureaucratic methods which are so characteristic of governmental activities, and which inevitably result in inertia and stagnation. For years Government officials have struggled to conduct their business in such an atmosphere, but to permit it to permeate the gen-

FRANK A. VANDERLIP,

President of the National City Bank of New York, who sees a danger to national prosperity in the growing tendency of the Government to interfere with legitimate business activities.

eral business situation, would prove disastrous. To quote Mr. Vanderlip's address:

> We are to-day a nation grown critical of business methods and resentful of business accomplishment. By far the greater part of governmental energies, as related to business, are directed toward destructive rather than constructive and creative ends. Business men have been called to account by Congress, commissions and courts, and are being punished for past deeds and hampered in present activities. The managers of railroads, although they have given to the public an average freight rate much less than what similar service costs in other countries, are bound with ever increasing bonds of hampering regulations, and are held to the strictest accountability for any failure of administration which falls below a hundred per cent of efficiency. Directors of railroad property are told what they owe to the people in the way of wise and efficient management, and in spite of results attained, with which the results in no other country are comparable, they are held up to the public almost in the light of criminals, compelled to perform their daily task under the regulating eye of agents of the government. If that is a fair measure of the duty to society which the managers of public utilities may rightfully be expected to perform, and I do not wish to be considered as denying that the public has a right to exact wise and efficient management, then why should not society demand wise and efficient conduct of the great agencies of production? If a railroad manager is culpable and is answerable to society for anything less than a hundred per cent of efficiency what of the farmer and planter, holding the great agency of production—land—and utilizing it with but forty per cent of efficiency? That is the indictment that stands against no small part of the agricultural community—a conduct of their business on a basis of forty per cent of efficiency. It will not do to say that railroad managers and corporation heads are the representatives of publicly subscribed capital and are therefore subject, in the interests of society, to a surveillance that applies only to the affairs of a public corporation, while farmers represent only personal investment and may be left to work out with such ignorance or intelligence as they choose to bring to bear the conduct of their own affairs. Farmers and planters also owe something to society in the way of intelligently conducting their business. They hold the means of production in their control. The public interest and the common good demand that they exercise that trust with intelligence, efficiency and thrift, quite as rightly as does public opinion demand efficiency and honesty in business administration. Prices of produce go up in answer to the inexorable law of supply and demand; values of the great agency of production—farm lands—have risen in our memory two or three hundred per cent, not because those lands were more efficiently managed, but because the demands of hungry mouths and backs to be clothed have made prices that permitted such increased values, even when not accompanied by increased efficiency of management.
>
> Is it not time for the maligned business man to direct some attention to the honest farmer, and to ask whether the people, whose demands the politicians are so fond of formulating, should not have directed against them and their small business methods some of the same analytical criticism that has been the order of the day to direct against big business?
>
> I believe that as a nation we have for some years been attacked by a hysteria of criticism against big business, until a majority of the people have come to believe that the way to secure prosperity is through legislation, instead of through intelligent hard work, improved methods, and a scientific application of the best knowledge to their own business. If you can do anything to direct the attention of the cotton planters of the South, or of the farmers of the whole country, to the fact that the fundamental cause of the high cost of living is not to be found in the offices where big business is managed, but rather in the ignorance and inefficiency of management of their own farms and plantations, you will have done something to clear the atmosphere and to enable us some time to get started on a new period of true prosperity.
>
> The particular men who happen for the moment to be occupying official position in Washington and elsewhere, and who are laying unbearable hardships upon the proper development of business in the United States, are not perhaps primarily to blame. The blame lies back of them in an ill informed and frequently unfair state of public opinion. We have had a period of magazine and political muckraking which has brought about a condition where business success is looked upon as a crime, where the man who has demonstrated that he can manage his business well is excluded from public counsel and where no small

part of our government affairs have been put into the hands of men who would be incompetent successfully to manage modest business affairs.

It is idle to rail at the public representatives of one party or another, or at one administration or another. We have got to get back of all that and create a sounder, a more intelligent, and a more honest public opinion. That cannot be quickly done, and it will never be done by a policy of silence on the part of those who represent important business interests. You have got something to do besides run your cotton mills. You and other business men must wake up to the fact that you have a public duty in the education of public opinion, and so long as you refrain from exercising it, you will not only hinder the industrial and commercial development of this whole country, but you will very directly permit your own business to be misunderstood and to be made the subject of unfair and uneconomic legislative attack. We are in a period of industrial and commercial depression.

The marvel is not that in spite of our great resources we are in such a period, but rather, with the terrible misunderstanding and misconception on the part of public opinion, that under a popular government, we are not in a condition of much deeper depression.

I regret that I cannot at the moment see any marked tendency in the direction of business improvement. We have the promise of great crops, although there is much uncertainty between such an early promise and ultimate fulfillment. Should there be complete fulfillment of that promise, it would, of course, temporarily, at least, bring with it improvement. We may be permitted an increase of railroad rates, and that would be doubly helpful, first on the side of its direct benefit, but even more on the side of a promise of fairer treatment. Business conditions are unsatisfactory, however, on account of fundamental reasons that are deeper than can be cured by one or both of these factors. The incentive for business men to take new risks, to expand their activities, to lead them to the inception of new or greater enterprises has received a serious check from the unfair attitude of public opinion as exemplified in Congress, by commissions, and in the printed page that reflects and molds the state of public opinion. I do not believe that we can hope for permanent relief from the unsatisfactory position in which business is now placed until we can get a public opinion that more truly reflects a fair attitude, based on correct economic principles. It seems to me the highest duty of business men, particularly such an influential group as is represented here, to contribute the best that is in them toward the creation of a wiser, a sounder, and a more intelligent public opinion in regard to business affairs. That can neither be done by silent acquiescence, nor by dissatisfied grumbling at existing tendencies. You must take your active part in forming public opinion. It is time for business men to speak out. Where errors and mistakes have been made, let them be frankly acknowledged, but insist upon a better understanding of your methods, your problems and your aims. Let your voice be heard and your views expressed with frankness and honesty, and we may then hope that an intelligent and informed public sentiment will give to business men fair play, and to business an enduring foundation upon which sound prosperity may be solidly built.

TO REGULATE THE ISSUANCE OF RAILWAY SECURITIES

The country at the present time is passing through a period of depression unequalled during the past decade. Business is practically at a standstill and severe distress is manifested in some quarters.

Rightly or wrongly there is a growing distrust among business men towards the present Administration and the recent introduction of additional trust legislation into the National Congress has not tended to lessen this feeling. Undoubtedly the country has not yet felt the full force of the new tariff law. While drastic readjustment can already be directly traced to it, the full effect of its influence will not be felt for some time to come.

The currency legislation represents about the only helpful and constructive measure of improvement to our general prosperity which has become a law under the present Administration. All that was crude and dangerous in this bill was largely eliminated through the united and vigorous opinion of the banking interests of the country. Unfortunately, however, there is no such check in sight in connection with the proposed new anti-trust bills which, in their present form, are crude, unworkable and dangerous and which have only added to the feeling of distrust everywhere manifest. It appears to be the President's attitude to settle the trust problem as soon as possible, because of its adverse effect upon business, enterprise and confidence. It might be pointed out, however, that it would be far better to leave the question unsolved than to attempt to handle this vast and intricate question, in which the welfare of the entire Nation is involved, without giving it the study and consideration which it demands and which can only be properly handled through the investigations of an expert board or commission whose recommendations should be employed to frame legislation of a constructive and salutory character, as well as containing the necessary regulative features.

Of the three anti-trust bills covering the subjects which President Wilson is pressing for legislative consideration, the last was introduced into the House of Representatives on May 7th, and covers federal supervision of the issuance of stocks and bonds by railroads. While the bill contains many provisions which are being severely criticised, railroad officials, as a body, do not object to some National supervision of the issuance of their stocks and bonds. Various States already have this power and there has developed a conflict of interests which can be largely eliminated by centralizing the authority over future financial transactions of this character. Several provisions of the bill, however, go far beyond the question of bond and stock regulation, and are believed to be fraught with danger to many important railroad corporations. The dominating features of the bill are summarized as follows:

First. A provision requiring railways, before issuing stocks and bonds, to obtain authority for such issues from the Interstate Commerce Commission.

Second. A provision requiring full publicity, through the Interstate Commerce Commission, of all facts bearing on the issue of railway stocks and bonds.

Third. A provision making it unlawful for any person to hold the position of officer or director of more than one railroad.

The last of these provisions reads as follows:

Unless the previous approval of the Interstate Commerce Commission shall have been secured it shall be unlawful for any person to hold the position of officer or director of more than one carrier subject to the act to regulate commerce.

This last provision would apparently afford the Interstate Commerce Commission means of ordering the dissolution of practically every railroad system which is made up of more than one line.

The bill further provides that it shall be unlawful for any railway corporation to issue any capital stock or certificate of stock, or any bond or other evidence of indebtedness, or assume any other obligation, "unless and until, upon application and after investigation by the Interstate Commerce Commission of the purposes and uses of the issue, and the proceeds thereof, such issue is approved by said Commission as necessary and appropriate for the purpose stated in the application." The only exception made in the application of this prohibition is in the case of one year notes issued by railways to an amount not exceeding five per cent of its outstanding stock and bond obligations.

Any person or persons who issue stocks and bonds contrary to the procedure laid down by the bill may be fined not less than $1,000, nor more than $10,000, or be imprisoned for not less than one year or more than three years, or by both such fine and imprisonment in the discretion of the court.

The provisions of section 20 of the rate act relating to the filing of reports by railways would be re-enacted. They are supplemented by a requirement that such reports shall hereafter include all information "regarding the issuance of stocks, bonds, and other certificates of indebtedness."

In seeking authority to issue new issues of stocks and bonds, the railroads are required to furnish this information:

First—The amount heretofore issued and the additional issues desired to be made.

Second—The amount held in the treasury of the railway as a free asset, or pledged, and if pledged, the terms and conditions of such pledges.

Third——The number and amount of prospective issues to be sold, pledged, or held as a free asset; the terms of sales and conditions of any pledge or pledges that may have been made.

Fourth—The preferences of privileges granted to the holders of any shares; the dates of maturity, rates of interest, and any conversion rights granted to holders, and the price, if any, at which such shares or bonds may be redeemed.

Fifth—The purposes, in detail, to which the proceeds of the issue are to be devoted.

Railways that refuse or fail to make reports as indicated shall be subject to a forfeiture of not less than $100 or more than $5,000 for each offense, and $100 for each day of the continuance of the offense. Any officer who fails or refuses to make reports in details as outlined is to be deemed guilty of a misdemeanor, and subject to a fine of not less than $1,000, nor more than $5,000, or imprisonment for a term of not less than one year nor more than three years, or both such fine and imprisonment.

On May 11th, representatives of railroads appeared before the Senate Committee on Interstate and Foreign Commerce to protest against this new bill. The delegation was headed by Robert S. Lovett, of the Union Pacific Railway, and A. F. Thom, chief counsel for the Southern Railway. The application of the bill's prohibition against interlocking directorates to railroads, they declared, would mean the disruption of all the great railway systems of the country.

The critics of the bill took the view that there might be ample ground for forbidding the interlocking management of great industrial corporations, whose affairs ordinarily were clothed with secrecy, and who might through common officials, work material wrongs to the public without detection. But the railroads they pointed out had no secrecy. The harm a railroad could do would be a wrong in rates and conditions of traffic, they said. But these wrongs were already prevented by the powers vested in the Interstate Commerce Commission.

A flat prohibition of interlocking control, they argued, would simply tear systems asunder and divorce all branch lines from the parent trunk.

The other witnesses were Samuel Rea, president of the Pennsylvania, and Frank Trumbull, chairman of the boards of the Chesapeake and Ohio and Missouri, Kansas and Texas Railroads. The witnesses represented 150,000 miles of railroad in the United States.

Mr. Lovett's statement was, in part, as follows:

> The enactment into law of this bill, in my opinion, would disrupt every great railroad system in this country. It would cause the greatest shock to railroad securities that has been felt in years.
>
> I recognize that there is a demand for some of this proposed legislation. I can see why the Government should not allow common directors in industrial corporations that compete, for they have secrets from the public. Railroads have no such secrets now, as the Interstate Commerce Commission has to give its permission to change rates. Therefore, the railroads should be dealt with separately. Railroads and industrial corporations are fundamentally different.
>
> If Congress is going to legislate on matters of this sort that legislation ought to be direct, making unlawful such interlocking relations, instead of merely barring a corporation that disobeys the bill's recommendations from interstate commerce.
>
> I find nothing in this bill that makes the election of a director of one company who is a director of a competing company unlawful. That is what the bill should provide.
>
> If it is to be the policy of the Government to abolish interlocking directorates, the law should be applied to individuals. If you would prohibit common directors, do it directly, and not in the way you propose here. This bill ought to be changed so as to distinguish between independent and subsidiary corporations.
>
> I believe that if this law is to be retroactive all great railroad systems in this country will be disrupted, and there will be the greatest shock to railroad securities ever known in the history of the United States. Great lines would have to dispose of their stock in subsidiaries.
>
> In my opinion, Congress should let stand the railroad systems that now comply with the provisions of the Sherman law and not make this bill retroactive.

ESTIMATED COST OF RAILWAY VALUATION

Recent results obtained by the Lehigh Valley Railroad in procuring a physical valuation of its property, are of more than usual interest at the present time in view of the larger work now just beginning, of procuring a similar valuation for the country's entire railroad system. The work of procuring the physical valuation of the Lehigh Valley was carried on by W. J. Wilgus, a civil engineer of New York. In testifying before the Interstate Commerce Commission Mr. Wilgus stated that it would cost approximately $324,500,000 to reproduce this system. To procure this result it took one hundred men fourteen months at a cost of over $120,000.

So far as the Lehigh Valley is concerned, this places the cost of procuring the valuation on a basis of $100 a mile and applying this average to the railway mileage of the country, indicates that it will cost the transportation interests of the United States $25,000,000 to make the physical valuation of their properties to say nothing of the additional, but much larger cost of procuring the maps, reports, etc., that the Interstate Commerce Commission will require. Railway men who have studied this problem believe that in addition to whatever it costs the Interstate Commerce Commission to conduct its physical valuation work, the railroads themselves will have to expend in the neighborhood of $125,000,000, all of which will have to be paid for out of earnings. This estimate is based on investigations conducted by experts for some of the roads and includes the sum of $100,000,000, which it is believed the lines will have to expend in supplying the specified sizes and types of maps and reports, not now in existence, but which the Commission will require.

PARCEL POST DEVELOPMENTS

The controversy between the Postoffice Department and the railroads goes merrily on. In the meantime the carriers are being forced to perform a vast service for which they are receiving no proper remuneration.

As has been pointed out before in these columns, the Government's attitude is indefensible. It has not advanced a single reason why the railroads should not be compensated for the enormous additional service which they are now performing. Following general governmental methods, however, it has delayed action and befogged the issue by injecting new and irrelevant theories into the controversy, and has shown a glaring disregard to the injustice done the railways by the inexcusable delay.

Feeling as the railroads do, that every day's delay in rectifying existing conditions, is an accumulative injustice, the managers for the carriers have submitted to Congress a formal recommendation as to a definite system which should be followed in compensating the railroads for carrying the mails.

This plan embodies four principles, as follows:

1. That the mail should be weighed annually (instead of quadrennially) and payment made for the weight and distance carried.

2. That mail apartments in railroad cars, fitted up as traveling postoffices, should be paid for.

3. That the side and terminal messenger service, between railroad stations and postoffices, and other special services, should be paid for.

4. That all rates of pay and conditions of service should be definite and not subject to the discretion of employes of the postoffice department.

It is believed by railroad managers that the adoption of these general principles and establishing fair units of pay will remove this complicated subject from public controversy. It would also result in payment for carrying the parcel post. The present situation is unjust and ought to be corrected.

The great development has increased the volume and tonnage of the mails enormously, and has correspondingly intensified the burdens and responsibilities of the carriers and it is the feeling of railroad managers that as soon as the American people realize the anomalous and inequitable conditions under which the railroads now carry the mails, prompt action will be forthcoming from Congress to provide adequate compensation for the service procured.

In a recently published bulletin, the Committee on Railway Mail Pay representing 264 railroads carrying mails on over 218,000 miles of line, has summarized the recent congressional investigation with reference to railway mail pay, as follows:

The Act of Congress approved August 24, 1912, provided for a joint committee composed of three members of the Senate and three members of the House of Representatives to make inquiry into the subject of postage on second-class mail matter and compensation for the transportation of mails, and report at the earliest practicable date. The committee, when appointed, consisted of Senators Bourne, Richardson and Bankhead, and Representatives Lloyd, Tuttle and Weeks.

On September 11, 1912, Senator Bourne addressed an inquiry to the executive officers of all railroads carrying the mails—795 in number—asking for an expression of opinion on the plan recommended by the Postoffice Department and embodied in Senate bill 7371. This plan proposed to pay the railroads according to the number of linear feet occupied by the mails in cars, the rate to be based upon the cost to each of the 795 railroads for operating expenses and taxes, plus six per cent. The cost was also to be ascertained by the Postoffice Department.

The railroads generally replied that the underlying principle of the plan was not correct. The Postoffice Department had based its recommendations upon its own incomplete and inaccurate presentation of the railroad statistics for the month of November, 1909. Further, that a cost based only upon operating expenses and taxes, plus six per cent, omitted allowance for interest on the investment, and was, therefore, fatally defective. Further, that if the full cost was ascertained for each railroad, even then any plan which used this as a basis of pay would be complicated in operation and unjust in its application by failing to take into account the value of the service rendered.

Beyond all these considerations was the further fact that in this case the Postoffice Department—the shipper—was undertaking to determine the cost for itself; to prescribe the car space it would pay for; and to buttress its position by a new clause in the law making it compulsory on the railroads to carry the mails under penalty of $5,000 for each failure.

The Congressional committee opened formal hearings on the subject on January 28, 1913, and these were continued until May 14, 1913, after which opportunity was given to both sides to sum up the testimony. The railroads presented their summing up on June 26, 1913, but the Postoffice Department took six months additional and presented their summing up on January 16, 1914.

How the Railroads Are Underpaid.

In the meantime a statistical adviser of the Congressional committee, Dr. M. O. Lorenz, associate statistician of the Interstate Commerce Commission, made a report dated September 27, 1913, in which he reached the conclusion that an increase in railway mail pay of at least 10 per cent. was warranted, with the suggestion that the adequacy or inadequacy of the pay could be further decided by reference to the Interstate Commerce Commission.

The secretary of the joint Congressional committee, Mr. R. H. Turner, made a summary of the hearings under date of November 28th, and reached the conclusion that on the present system of pay the railroads are underpaid approximately $12,000,000.

The Second Assistant Postmaster General in his summing up of January 16, 1914, reiterated the position of the Postoffice Department, and on February 12, 1914, submitted a new plan of paying the railroad companies on the space basis at certain rates per car mile, but claiming for the Postoffice Department the power to prescribe the car space that would be paid for, full control of the railroad facilities under heavy fines which the Postmaster General might impose without limit, and reserving to the Postmaster General discretion to change the conditions under penalty of $5,000 fine for every failure of a railroad company to carry the mails.

In the original bill, Senate 7371, the Postoffice Department had abandoned the weight basis of pay in favor of space based upon cost to the individual railroad. In the new bill it abandoned the cost basis in favor of a space basis, which, while ostensibly associated with definite rates was left entirely within the discretion of the Postmaster General.

The railroads submitted to the joint Congressional committee on February 26, 1914, an earnest protest against the findings and conclusions of the Postoffice Department as set forth in its summing up of January 16, 1914, and as embraced in its new proposals of February 12, 1914. The Second Assistant Postmaster General replied in a lengthy statement of March 24, 1914.

The railroads made their closing statement on April 1, 1914, and the joint Congressional committee, after verbal discussion, closed the hearings finally on April 3d. The testimony, all taken under oath, is the most complete and valuable ever submitted on this important subject, and is comprised in pamphlets which already include about 1,300 pages of printed matter.

The Fair Basis.

The railroads' committee has studied this whole question for over four years. It has endeavored to regard the question from all sides. It has attempted to consider the interests of the people, of the Postoffice Department, as well as of the railroads. It has carefully examined the record of previous investigations and the various plans proposed for changing the method or the basis of pay. It has especially studied the suggestion that the present basis, i. e., the weight of mail transported multiplied by the distance it is transported,be abandoned, and that the basis of car space authorized be substituted therefor.

The railroads' committee has concluded that the original plan, as embodied in the law of 1873, is the safest and most enduring basis for all of the parties concerned. That the *weight* of mail carried and the *distance* it is carried represent the essential service rendered. It is, therefore, the most direct element upon which the pay should be measured and computed. The weight basis is also the most definitely ascertained basis and the one regarding which there can be no uncertainty. It is not subject to fluctuation, according to individual opinion. The car space plan of pay involves estimates based on individual opinion, and this would be dangerous to both parties.

The railroads' committee, therefore, adhere to the recommendations made on October 3, 1912, to the joint Congressional committee, as follows:

1. For the repeal of the Act of March 2, 1907.
2. For annual weighing and a definite and just method for ascertaining daily average weights.
3. For pay for apartment cars on some basis that will compensate for the service.
4. For a fair allowance to the railroads for side and terminal messenger service which they perform for the Postoffice Department according to the value of this service to the Postoffice Department.
5. That all rates of pay should be definite and not subject to the discretion of the officers of the Postoffice Department.

FURTHER OPPOSITION TO EXTENSION OF PARCEL POST

Attention was called in last month's issue to the growing opposition manifested among shippers towards a further increase of the parcel post weight limit. At that time a number of organizations had already passed vigorous resolutions opposing any further extension of the parcel post service, deploring any action which might tend to drive the express companies out of business. Recent developments indicate that this movement is rapidly spreading throughout the country, and resolutions continue to be passed by various trade organizations in opposition to any further extension of this service.

The San Francisco Chamber of Commerce, the largest and most influential commercial body west of the Missouri River, has adopted resolutions to this effect, while the Commercial Club of Omaha, the Board of Trade of Vicksburg, Miss., the Board of Trade of Elizabeth, N. J., The Oakland Chamber of Commerce of Pittsburgh, Pa., the Chamber of Commerce of Bluefield, W. Va., the Merchants' Freight Bureau of Little Rock, Ark., the Board of Directors of Everett, Mass., the Board of Directors of the Commercial Club of Lincoln, Neb., and the Buffalo, N. Y., Chamber of Commerce have joined those reported in last month's issue, as opposing the further extension of the parcel post service. As these organizations represent largely the individual shippers who would be benefited by such an extension, it is anticipated that the opposition as indicated by the resolutions passed by these various organizations and forwarded to members of Congress and to the Postmaster General, will for the present at least check the evident desire of the Postoffice Department to drive the express companies out of business.

THE OUTLOOK FOR EXPRESS COMPANIES

The liquidation of the United States Express Company has led to the belief in various quarters that there will be other eliminations from the ranks of the express field. While it is too early to draw any definite conclusions, some transportation officals profess to see a growing tendency in the direction of a unification of the express business of the country. As a step in this direction, it is pointed out there are already a large number of joint offices, and that tendencies in this direction are on the increase.

The *Wall Street Journal,* in commenting upon the probable effect of such an amalgamation, has had, in a recent issue, the following to say:

> Complete unification would result, it is said, in greater economy in practically all divisions of fast package transportation, particularly in terminal service, and increase efficiency by simplifying practices and eliminating interchanges. It would also mean, according to some transportation experts, a concentration of competitive effort on business over eleven pounds, leaving the less than eleven-pound business to the parcel post, where, according to these experts, under the changed conditions, it properly belongs.
>
> Furthermore, putting the express business of the country in the hands of one company, would be a development in line with what several members of the Interstate Commerce Commission, at the time of the investigation, were understood to believe would be a solution of nearly all the express problems before the Commission.
>
> Notable among these was Franklin K. Lane, then a commissioner, who directed the exhaustive investigation. He was personally known by many express and transportation men to favor such an amalgamation, and it is said by these that many of the questions asked by him were designed to uncover the minds of others on this phase of possible express business development.
>
> The chief determining factor as to whether an express company can afford to continue business, of course, will be the results of operation under the materially reduced rates in effect since February 1 last. Up to the present time, only an approximation of the operating results for the first month under the new rates is available, and the prospective result is not very encouraging. There has been an increase in packages handled, but the increase in revenue was not what was expected, compared with the new business done, and net results were still discouraging.
>
> It is not likely that any of the express companies will seriously consider the advisability of going out of business until the lower rates have had a fair trial. Express company officials believe that six or eight months ought to be sufficient to demonstrate how the companies are faring under the lower rates. The practical elimination of the United States Express Company from the transportation field will throw upward of $22,000,000 of business, measured bp oreating receipts, to the other companies, and if these companies can share in this additional business, on an operating privilege basis of about 40 per cent, or better, with the railroad companies, they stand a fairly good chance of making a profit out of it. Those in close touch with express company business believe that the companies now in the field will wait at least until the conclusion of operations this fiscal year, before giving any consideration to the advisability of continuing in business.

SUPPRESSING NOISE IN RAILWAY STATIONS

It is not hard to understand that, under normal conditions, a railway station would not be chosen as a favorable locality in which to woo the slumber god. The arrival and departure of trains, the incessant hum of voices, the transfer of baggage, the popping of safety valves and other noises indigenous to such a place, are hardly conducive to rest. However, it does seem strange that railroads, in providing modern sleeping cars and placing them at the convenience of passengers, at a considerable time prior to their departure, should not have adopted more effective measures, by which many of these noises, wholly unnecessary, might be suppressed.

It is encouraging to note that one important road has arrived at this conclusion. The Northern Pacific has recently issued an order that loud talking, ringing of engine bells, sounding of whistles, blowing off of steam and other avoidable noises, over which employes have control, are to be avoided and reduced, in the future, to a minimum, and that the coupling of cars at stations, setting out or picking up cars, are also to be controlled by signals and done as silently as possible. General instructions have been sent out from headquarters to trainmen, station agents and others to bear these facts in mind, and to reduce all avoidable noises and talk to the lowest limits during the night hours.

There is no doubt but that the traveling public will appreciate this effort on the part of the Northern Pacific, and it is suggested that other lines might adopt a similar policy to the advantage of their patrons and themselves.

THE STUDENT COURSE OF THE SOUTHERN PACIFIC

Salient facts about the Southern Pacific company's student course were pointed out by Norman Collyer, chief clerk to the president of the company, in a paper read before the Safety First Conference, University of Nevada, recently, Mr. Collyer explaining that the idea was conceived and put into effect by Julius Kruttschnitt, while vice-president and manager of the company; that it was first crystallized into syllabus form under the administration of Vice-President E. E. Calvin and that later it was extended, by direction of President Sproule, to embrace the traffic and accounting as well as operating departments, said, in part:

"To my knowledge, the Southern Pacific Company was the first railroad in the United States to adopt an orderly, systematic scheme for the development of executive talent through the medium of apprenticeship. There is nothing spectacular about the course. We do not claim to make superintendents and general managers over night. We are just trying to make all 'round railroad men in a new way.

"The aim of our student course is to give to young men in the employ of the company an opportunity to pass through different departments for the purpose of gaining such co-ordinated knowledge of the entire railroad as will fit them better to assume positions of responsibility. It is, in fact, a laboratory course wherein the student performs the actual work of the department to which he may be assigned, supplemented by a parallel course of reading in text books and periodicals.

"Briefly, the procedure is as follows: Upon appointment the student is first placed at a station of medium size for a period of six months. This is because the station agent handles both the beginning and the end of transportation. The student is expected to perform such duties as are assigned to him by the agent, and the agent is expected to afford him such diversified experience as will give him an all-around knowledge of station work, including ticket office, warehouse, baggage room, yard and the solicitation of business. Being an extra man, the student is not bound down to routine, but is permitted to distribute his time in such a way as to treat each feature with equal thoroughness.

"Next the student is assigned consecutively to maintenance of way, the office of the superintendent of transportation, motive power, train service, accounting department and tariff bureau, spending three months in each. This completes his second year as a student and he should now have a working knowledge of the several departments of the railroad and their mutual interdependence. At the student's option (subject to the approval of the management) he next elects to specialize in either operation and maintenance, passenger and freight traffic, or accounting. Completing his work in either of these, he is given, after his graduation, such special experience as is needed to fit him for a regular position; thereafter everything depends on himself.

Contemporary Opinion

The Truth Is Wanted.

(From the Providence (R. I.) Journal.)

A POPULAR impression that American railroads are greatly over-capitalized and that rates are lower on the Government-owned roads of Europe is effectively disproved by the facts presented in an address delivered recently by Mr. Slason Thompson, a statistician of reputation, to the members of the St. Louis Railroad Club.

Mr. Thompson takes the ground that there is absolutely "no possibility that the American people ever will experiment with the Government ownership of their railways unless they are completely hoodwinked by the stream of misrepresentation and malinformation regarding American conditions that flows through our legislatures, colleges and public prints." This statement is based upon conscientious study of American and foreign reports and personal observation of American and European railroads and practices. It is, therefore, a timely and valuable contribution on a subject about which much is said and concerning which there is little actual knowledge.

American capitalization, said to be extravagantly high, was $63,944 per mile in 1911, according to the figures of the Interstate Commerce Commission. To-day it does not exceed $65,000 a mile, and for every mile of track there is approximately half a mile of second, third and fourth track Abroad the capitalization is staggering in comparison with that of the United States— $114,145 in Germany; $145,294 in France; $134,966 in Austria; $126,886 in Italy; $190,914 in Belgium and $277,345 in the British Isles.

Mr. Thompson is emphatic on one point—that the foreign roads on the average are no better than ours—except, perhaps, in the matter of stations; he describes them as "toy roads." In Germany, for example, eighty-six per cent of the passenger cars have less than four axles and ninety-seven per cent of the freight cars have only two; automatic couplers are unknown and there are air brakes only on passenger and express freight lines. And the capital cost in Europe is increasing steadily because all betterments and impovements "down to the last blooming spike" are charged to capital.

The American practice is to put back a part of the net earnings into the property. This keeps the capitalization down, and at the same time American managers are giving the people rates one-half cheaper than those of the Government-owned roads and are paying much higher rates of wages. These figures leave no doubt as to the superiority of American facilities, and that American politicians would make any better showing than those of Europe is very doubtful; in fact, political management here might easily be worse than anything found abroad.

Mr. Thompson's presentation of facts showing that capitalization and rates here are far lower than in Europe merit the widest publicity. Public opinion should be based upon the truth instead of the wild assertions about "countless billions of water and rates that mean robbery" made by the irresponsible demagogues with which this country is afflicted.

Putting it Up to the People.

(From the Commercial and Financial Chronicle.)

IN their apparently self-conceived capacity of defenders of the people against railway aggression, the members of the Interstate Commerce Commission continue to step with great hesitation, but a decision is "expected" at some movable future date. This does not prevent their allowing Mr. Brandeis to keep close to them, notwithstanding he is quoted as admitting that "these higher rates seem to be required." The courtesy (or possibly the weariness) of the Senate has caused that body to adopt without discussion Senator La Follette's resolution calling on the Commission for copies of all communications, anonymous or otherwise, which it has received in regard to the pending case, and intended to "influence" its action thereon; he does not seem to fear oral communication, and Mr. Brandeis is regarded as an exception, being a sort of "counsel" sitting on the bench next the judges.

Presentation of the incontestable figures of expenses and net earnings continues on behalf of the roads, a subject on which nothing new can possibly be adduced; yet we remark once more that the final decision upon the future of transportation in the United States will be given by the private owners of capital who are to lend it or decline it for railway purposes and that they will certainly take full and selfish note of the outlook as indicated by such facts, for example, as that the Pennsylvania's increase in net operating income in the last ten years has been at the rate of not quite 2¼ per cent on the increase in its property investment in the same term. Some persons are estimating upon a possible enormous or even record-making wheat crop in this season. They may be over-sanguine and it is still early; but if these pleasant expectations as to cereal and other crops are fulfilled, there may be all the more trouble because of the carriers' inability to handle them. Is this worth treating as a factor to be considered, or shall we just say that the railroads will do as they "must," regardless of whether they can?

In the vernacular of the day, this subject is "up to" the people, or it will be so ere long. Mr. Elliott, of the New Haven, has been doing his utmost to inform and arouse them, and he is trying to move the stockholders of that road to exert their influence. If the Governmental authorities, he tells those stockholders, believes that a majority of the American people are not in favor of extending aid to the roads, such aid will probably be refused. Therefore, he says, "over 27,000 stockholders should express their opinions, for just a little help from the stockholders will make just the difference between success and failure." Then he adds a sentence which for sententious putting of an immovable fact and for pithiness we have never seen surpassed: "One of the troubles is that the railroads are being chased round the yard, and you know that a hen chased round the yard just to hear it squawk cannot lay eggs."

Here is a page of argument packed into proverbial form. The wayfaring man, though a fool, cannot escape seeing the point. This hen illustration should be passed along to and kept before the American people. Do they want, and expect, the railroad hen to keep laying eggs? If they think the country can get on without transportation eggs, or that the overworked though much-cackling Governmental hen can lay those more satisfactorily, the American people can continue applauding (or idly permitting) the chasing around. If they think otherwise, and if they need eggs (admitting that nobody cares for the hen per se) they would better call off the politicians who are doing the chasing.

Railroad Profits and the Small Investor.

(From the "Wall Street Journal.")

STATISTICS compiled as of the close of the last fiscal year on June 30th, or dates as near that as practicable, show for nine of the principal eastern carriers an increase of 19,000, or more than eleven per cent in the number of shareholders as compared with the year before. There has been liquidation in stocks since the middle of last summer, but not from the rank and file of stockholders. For example, the Pennsylvania Railroad had on April 1st, 89,602 shareholders, or 12,756 more than on the same date a year ago.

This company offered to its owners a ten per cent allotment of new stock during the intervening year. A large number of newcomers joined the ranks of Pennsylvania Railroad owners in that period and the average holdings were 6.69 shares to 111.44 shares each. Even during the turmoil of litigation and obstructed financing the New Haven passed through, in the calendar year 1913, its stockholders increased in number by 3,524 or fifteen per cent.

It is the rule for stockholders to increase and average holdings to decrease on falling prices; and the nearer prices approach the bottom of the "big swing" the more rapidly do small holdings multiply. A few persons outside the speculative area buy at high prices, but for every one such there are ten intelligent bargain hunters. This movement was less surprising following the stock market collapse of October, 1907, but the facts go to show that neither the narrowing margin of railroad earnings, nor slackness in industry, nor the threat of radical legislation, has seriously impaired the influence of prices over the mind of the average man with relatively small accumulations to invest.

Railroad Valuation Folly.

(From the "Boston Transcript.")

IF it is not too late for the Government to retreat from the project for the physical valuation of the railroads of the country—and we do not see why it should be—it ought to shelve its preparations and call the incident closed. It does not appeal to the business sense of the country. It is a purely academic enterprise that will have no practical results of value. The only effect of which we are sure is that it will add many millions to the burdens that the country and those who are compelled to furnish its revenues are already carrying. The estimated cost of the this so-called service grows the further we advance in the business. It was thought at the outset that twelve million dollars would cover it, but now it is represented that twenty millions will be needed. The probable cost to the railroads will be a much larger sum. There are more than a quarter of a million miles of these properties, and fifty million dollars are the lowest figures mentioned as their exaction for this inquisition. Some calculations put the amount at $125,000,000 and the cost to the Government twenty-five millions, almost half as much as it has cost us to build the Panama Canal.

"'But what good came of it at last?' quoth little Peterkin." That is something that no one can say in advance, and something that we believe will be of very doubtful demonstration when the work is completed.

The Canal Tolls Issue.

IN the Canal Tolls controversy, so far at least, as the general public is concerned, there seems to have been a lack of definite understanding as to the facts behind the issues involved. An article from the Springfield (Mass.) "Republic" on "The Canal Tolls Issue" which is reprinted in part below, points out the main issue very clearly.

"The national Democratic platform did endorse the exemption of American coastwise shipping from payment of canal tolls and the president did deliver a speech in the campaign which contained a passage that can be interpreted as approving that particular plank in the platform. The present about-face by the party and the president is to be justified morally on the ground that the nation's treaties are more sacred than political platforms. A president not only may change his mind, but should change his mind on questions of national policy if grave reasons of state, in his opinion, make the change advisable. In regard to observing treaty obligations, he should not hesitate to reverse his original position, moreover, if deeper study convinces him that his original views are ill founded.

"We assume that the president reversed his position and asked his party to reverse its position because he has come to believe, first, that the interpretation of the Hay-Pauncefote treaty upon which was based the exemption clause of the canal act is erroneous; second, that the nation's larger interests extending all over the world would be unduly sacrificed by stubbornly adhering to an interpretation which all foreign governments unquestionably believe to be a barefaced repudiation of an unmistakable treaty pledge.

"That the president changed his position because of the Mexican situation alone is very improbable. We must think of national honor. But there is a Japanese situation in the background. The Japanese have already questioned our government's interpretation of their treaty with the United States in regard to alien land ownership. Are they likely to accept a new treaty embodying American views on that subject if our government exposes its good faith to sharp attack in the matter of the canal tolls? Or are they so likely to acquiesce in our interpretation of the old treaty?

"The president would be a very poor statesman if he failed to appreciate the inestimable value of England's good will and cordial support of the United States in all the critical questions liable to arise in our relations with Japan. England is Japan's ally; without English support, Japan can do nothing aggressive in dealing with other western powers. Assume that the Mexican situation should finally force American military intervention—a contingency not so remote or improbable that it should not be provided for in the domain of diplomacy. Is it not clear that the military occupation of Mexico by the United States would present at least a temptation to the Japanese to take a more aggressive attitude toward this country regarding Japanese land ownership or Japanese immigration? Does not wise diplomacy dictate that in such an emergency England's support of the United States should not be in doubt one moment? Our Anglophobes are stupid folks. They assume that we can snub and kick England forever without having to pay the price of such treatment.

"England's unassailable claim to the same treatment the United States gets in canal tolls is based on this clause of the treaty of 1901, a treaty now in force:

"The canal shall be free and open to the vessels of commerce and war of all nations on terms of entire equality, so that there shall be no discrimination against any such nation or its citizens or subjects in respect to the conditions or charges of traffic or otherwise.

"Joseph H. Choate was embassador to England when the treaty was negotiated, and in a speech last month, he said:

"I venture to say now that in the whole course of the negotiation of this particular treaty no claim, no suggestion, was made that there should be any exemption of anybody. How could there be in face of the words they agreed upon? Lord Pauncefote and John Hay were singularly honest and truthful men. They knew the meaning of the English language, and when they agreed upon the language of the treaty they carried out the fundamental principle of their whole diplomacy, so far as I know anything about it, and in the six years I was engaged with them their cardinal rule was to mean what they said and to say what they meant.

"England has the largest merchant marine on the seas, and that marine gets subsidies only in the form of mail contracts. Our correspondent asks what benefit 'we' are to receive from the canal, after spending $400,000,000 on it, if our coastwise shipping must pay tolls? Who are 'we'? Prof. Emory R. Johnson, the foremost authority on the traffic questions of the Panama Canal, insists that exemption of coastwise shipping must mean increased taxation of the whole country, because without these tolls it will be impossible to make the canal earn enough to pay running expenses. If 'we' means all of us, then all of us will not be benefited by this special favor to a particular interest, for taxation must be imposed to make good the deficit in canal revenues.

"It is singular what emphasis is now being placed on the mere commercial advantages of the canal to American shipping. The truth is the canal was not built primarily for commercial reasons; it was built for military reasons, which the country saw in a flash when the Oregon had to round the Horn in the Spanish War. As a commercial enterprise the canal may never be a success; but, as Mr. Choate so well and truly said: 'From the time that this question of a canal through the isthmus or a canal from the Atlantic to the Pacific, whether through the isthmus or by way of Nicaragua or Tehuantepec or anywhere else, was agitated, the universal declarations of public men, of presidents and secretaries of state, and other public men on both sides of the Atlantic, were to the effect that the canal should be built for the benefit of mankind, on principles of universal equality of the vessels of all nations, and without any discrimination in favor of any nation.'"

The Influence of the Panama Canal Upon Coastwise Traffic.

MR. WINTHROP MARVIN, has recently made some timely observances in the London "Times" with reference to the stimulating effect of the Panama Canal upon American coastwise traffic. While our foreign trade carried in American bottoms, is practically of a negligible quantity, the preparation for the increase in coastwise trade, through the opening of the Panama Canal, has stimulated shipbuilding to such an extent that American ship yards have enjoyed in the past two years the most prosperous period of ocean-going steel shipbuilding in their history. In referring to the possibilities of this traffic, Mr. Marvin says:

"American preparation for active use of the Panama Canal is undoubtedly more ambitious and far-reaching than has been understood in Europe, where the American merchant marine is regarded as a negligible quantity. It is true that out of the hundreds of regular transatlantic liners, only six ships fly the American flag, which has become less familiar than the ensigns of Portugal or Greece in the great ports of the United Kingdom and the Continent. But the American coastwise shipping, which seldom, if ever, leaves its home waters, is a vast fleet, and is rapidly increasing, both in tonnage and efficiency. Out of the 7,714,183 tons of merchant vessels, as officially reported by the Bureau of Navigation, 6,782,082 tons are engaged in American trade, and only 933,101 tons are registered for foreign carrying. A large proportion of the coastwise fleet, or 2,949,924 tons, is being operated on the great northern lakes, but a still larger proportion, or 3,625,925 tons, is engaged on the Atlantic seaboard. The Pacific fleet is 963,319 tons. As a recent review of the subject has stated:

"'Our coastwise fleet of 6,782,082 tons compares impressively with the 1,380,057 tons of British shipping employed wholly or partly in the coastwise trade of the United Kingdom, or with the entire German merchant marine, in both foreign and domestic commerce, 4,503,095 tons; or with the total 2,088,065 tons of France, or with the total 1,452,849 tons of Italy.'

"The coastwise shipping of the United States amounted to 3,409,435 tons in 1890. Since that year it has doubled—an increase far greater than the growth in wealth or population. This native marine is now one of the most important and successful of all national industries, and its advance in the past decade has been more notable than ever before.

"Foreign built vessels, if owned by American citizens, can now secure American registry, but they may be operated only in the foreign trade. Domestic commerce is as strictly reserved to native shipbuilders as it always has been since the beginning of the Republic."

The Express Situation.

(From the "Express Gazette.")

FEBRUARY FIRST marked the beginning of a new era in the express business.

The Interstate Commerce Commission spent two years and a quarter of a million dollars investigating the business and complaints against it.

The principal complaint semed one to which many successful business men must plead guilty —making too much money.

It is believed the order of the Commission, as embodied in the new reduced rates, will prevent a repetition of that complaint, because those most closely following express affairs can see little opportunity for future profits.

It is not generally remembered that the right of express companies to exist was favorably passed upon by the United States Supreme Court in 1883, nor that express companies, as we know them, do not exist outside of North America.

In North America the work of the pioneer has preceded our wonderful development; and it would be difficult to find a pioneer who has not been aided in his work by the express.

The work of the pioneer profits him most when followed by development; he enjoys his profits in the belief that the risk and hardships of his adventure are titles to his reward. The express companies have done much pioneer work and have rendered invaluable aid in the country's development.

The new rates are adopted, not as a matter of choice, but of necessity. If, under careful management, they will return the cost of producing

The Railroad Goat.

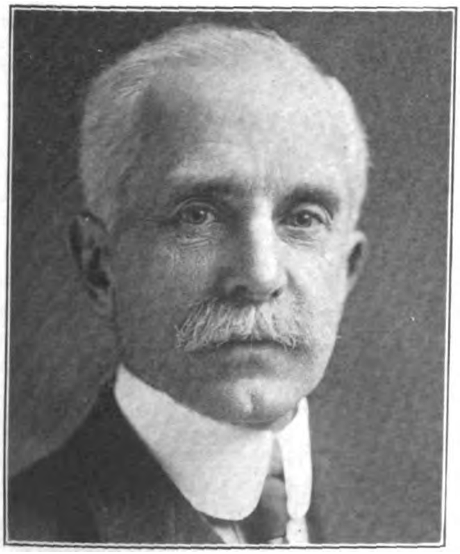
If a change in administration
Slows up biz throughout the nation—
Let the railroads "be the goat."
Make them carry parcel post
Even if it is a "roast";
Whoop it up by tons a day
Without a cent of extra pay.
Protests? File them all away;
Parcels post has come to stay.
Department books must show a gain.
Here's the slogan, written plain—
"Let the railroads 'be the goat.'"

If labor wins a higher wage,
And other costs becloud the page—
Let the railroads "be the goat."
Do not let them raise the price
Of transportation; 'tisnt nice,
Unless commissions hem and haw
Dilly-dallying with the law
For months and months. And all the while
Attacks are framed in every style,
Investigating this and that
Till dividends have fallen flat
And price of stock's too low to quote—
The railroads surely are "the goat."
—Boston News Bureau.

Personal

Edward T. Stotesbury.

EDWARD T. STOTESBURY, of Philadelphia, banker and director of many corporations, has been chosen to head the Reading System as successor to the late George F. Baer. He becomes president of the Reading Company and chairman of the boards of the Philadelphia and Reading Railway and of the Philadelphia and Reading Coal and Iron Company. Although Mr. Stotesbury, unlike his predecessor, will not hold the presidency of the two operating corporations, the railway company and the coal and iron company, his appointment as chairman of the boards of these two companies places in his hands direct power, little, if any, smaller than that wielded by Mr. Baer.



Edward T. Stotesbury.

How closely Mr. Stotesbury worked with Mr. Baer and how fully he may be expected to continue the latter's financial policies is expressed in the statement issued by the Board of Directors, as follows:

"As is well known, Mr. Stotesbury has been a member of the Reading board for a number of years, and has taken a great interest in the affairs of that company. His personal relations with Mr. Baer were very intimate and probably he, better than anyone else, was in a position to know the views which Mr. Baer held concerning the future of the properties which he had so long and so successfully managed."

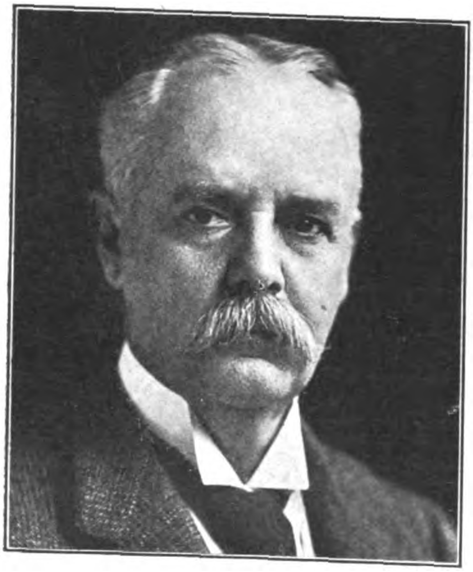
Mr. Stotesbury is 65 years old and a native of Philadelphia. He has been a banker all his business life and with the same house. He entered the banking firm of the elder Drexel when he was seventeen years old, and has risen to be the chief resident partner in this city of the

Drexel-Morgan firms and a member of the Morgan houses in this country here and abroad. He is conceded to stand second in seniority only to the present J. P. Morgan.

In addition to his banking connections, Mr. Stotesbury is a director in something like threescore of corporations, many of them of the first degree of importance and including the following: Central Railroad of New Jersey, Lehigh Valley Railroad, Baldwin Locomotive Works, Delaware, Susquehanna and Schuylkill Railroad Company, Franklin National Bank, of Philadelphia, Pennsylvania Steel Company and Philadelphia National Bank.

Theodore Voorhees.

THEODORE VOORHEES, who has been elected president of the Philadelphia and Reading Railroad to succeed George F. Baer, deceased, was born in 1847. He is a civil engineer by profession and has spent his active career in railway work. Prior to his connection with the Reading, he was associated with the Delaware, Lackawanna and Western, the New York Central and some smaller roads in New York State. He went to the Reading in 1893, as vice-president, holding this position until his recent election.



THEODORE VOORHEES.

W. J. Richards.

W. J. RICHARDS, who has been elected president of the Philadelphia & Reading Coal and Iron Company, was born in the coal regions at Minersville, Pa., and his connection with the anthracite coal business was almost a birthright. He first became associated with the Philadelphia and Reading Coal and Iron Company in 1882. Later he served in the Mineral Railroad and Mining Company, and the Lehigh and Wilkes-Barre Coal Company. In 1903 he was made general manager of the Reading coal properties and in 1905 became second vice-president. Two years later he was made first vice-president.

W. J. Besler.

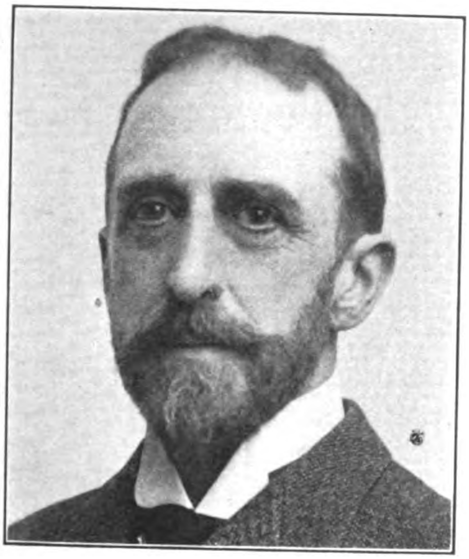
W. J. BESLER, who has been elected to succeed the late George F. Baer, as president and general manager of the Central Railroad of New Jersey, was born March 30, 1864 at Galesburg, Ill.

He entered the service of the Chicago, Burlington & Quincy Railroad in 1880, as trainmaster's clerk. He resigned in 1884 to attend the Massachusetts Institute of Technology, graduating in the class of 1888. Upon leaving college he returned to the Burlington and from 1888 to 1899 was consecutively yardmaster, chief train dispatcher, trainmaster and division superintendent. Mr. Besler left the service of the Chicago, Burlington & Quincy in 1899 and entered the service of the Philadelphia & Reading Railway, as division superintendent of their main line. A year later he was made general superintendent of the same road, and in 1902 was transferred to the Central Railroad Company, of New Jersey, as general manager. Mr. Besler has been vice-president and general manager of that company since 1903.

J. H. P. Hughart.

J. H. P. HUGHART, who on April 1st, was elected president of the Grand Rapids and Indiana Railway Company, was born in Pittsburgh, on December 1, 1854. He received his education from private schools in Pittsburgh and from the Massachusetts School of Technology, and first entered railway service in the employ of the Pittsburgh and Connellsville Railroad on September 1, 1869 as clerk in the treasurer's office. He also served in the engineering department of this road and in the auditor's office of the Union Line at Pittsburgh.

Mr. Hughart entered the service of the Grand Rapids and Indiana Railway Company, May 1, 1874, as president's clerk, serving in that capacity until December 1st, of the same year. From the latter date until February 28, 1877, he was purchasing agent as well as president's clerk, and from 1877 until 1892, secretary and assistant to the president. From this position he was



J. H. P. Hughart.

elected to that of second vice-president and general manager, which position he held at the time of his recent election to the presidency.

Charles H. Markham.

CHARLES H. MARKHAM, president of the Illinois Central, has recently had the chairmanship of the Board of Directors of the Central of Georgia Railway added to his many heavy responsibilities. Mr. Markham, who was born in 1861 at Clarksville, Tenn., offers a striking example of the reward possible to those in the railway service who perform their duties in an efficient and faithful manner. Mr. Markham began railway work in 1881, as section laborer with the Atchison, Topeka and Santa Fe. From that year until 1887, he was engaged in various positions in station service with the Southern Pacific Company at Deming, N. Mex., and at Lordsburg, N. Mex. From July, 1887, to 1890, he was agent for the same company at Benson, Ariz., and from February, 1890, to March, 1891, agent at Reno, Nev. In March, 1891, he became agent for the Southern Pacific at Fresno, Cal., in charge of freight and passenger business and in 1901, was made general freight and passenger agent of the Oregon Lines at Portland.

September 1, 1901, found him assistant freight traffic manager of the Southern Pacific Company at San Francisco, and on December 1, of the same year, he became vice-president of the Houston and Texas Central Railway. On April 1, 1904, he returned to San Francisco, as general manager of the Southern Pacific Company, and on June 1, 1904, was also made vice-president of this road. He left the railway service on November 1, 1904, to become general manager of the Guffey Petroleum Company at Beaumont, Texas, and during the calendar year 1910, was president of the Gulf Pipe Line Company and the Gulf Refining Company and allied companies at Pittsburgh, Pa. On January 12, 1911, he was elected president of the Illinois Central Railroad and, in addition to this position, which he now holds, he became on February 8, 1911, president of the Ocean Steamship Company of Savannah, and of the Central of Georgia Railway. It was on April 8, 1914, that he was made chairman of the Board of the latter Company.

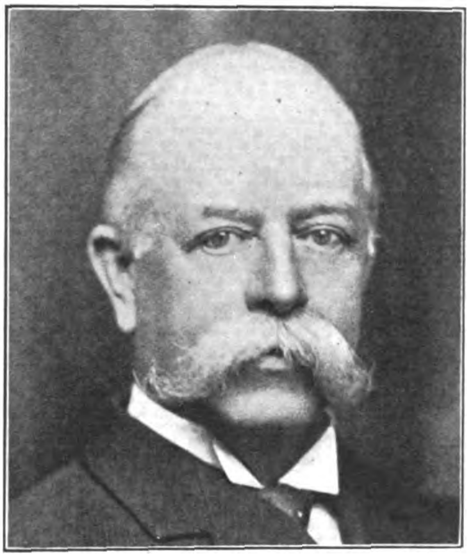
C. H. Markham.

William Alfred Winburn.

WILLIAM ALFRED WINBURN, who has been elected president of the Central of Georgia Railroad Company, was born at Gainesville, Ga., in 1863. He began railway work in 1880, as clerk in the freight office of the Richmond and Danville at Gainesville, and subsequently became clerk in the office of the assistant general freight agent of the same road, which position he held until June, 1883. The

William Alfred Winburn.

following three years were occupied as passenger agent of the Western North Carolina, and in 1886, he again returned to the Richmond and Danville in the same capacity. The following year he was appointed division freight and passenger agent of the same road, and in 1882 became clerk in the general manager's office of the Columbus Southern, now a part of the Seaboard Air Line. From April to June, 1892, he was clerk in the traffic manager's office of the Central Railroad and Banking Company of Georgia, at Savannah, and from the latter date until October, 1901, was general freight agent of the Central of Georgia Railway. On October 1, 1901, he was promoted to the position of traffic manager, and from July, 1902, to 1904, was vice-president and traffic manager of the same road. He was then elected second vice-president, and from October, 1908, to December, 1910, was vice-president in charge of traffic. Since that time he has been vice-president in charge of traffic and operation, which position he held at the time of his recent election as president.



Joseph B. Hutchinson.

JOSEPH B. HUTCHINSON, until April 1st, assistant to the vice-president in charge of real estate, purchases and insurance of the Pennsylvania Railroad with office at Philadelphia, was retired on that date under the pension rules of the Company.

Mr. Hutchinson was born at Bristol, Pa., in 1844, and graduated from the Polytechnic College of Pennsylvania in 1861. He entered the service of the Pennsylvania Railroad in 1863, as rodman and was promoted in 1864 to assistant engineer. The next year he became assistant engineer of maintenance of way and construction, and in 1868, was transferred to the Columbia and Port Deposit as assistant engineer, which position he held until 1869, when he was appointed assistant engineer of the Butler Extension. In 1870, Mr. Hutchinson was promoted to principal assistant engineer of the Columbia and Port Deposit and in 1877, was made assistant superintendent of that road. In 1879, he became superintendent of the Lewistown Division; in 1881, superintendent of the Frederick Division; in 1884, superintendent of the Altoona Division; in 1890, superintendent of the Western Pennsylvania Division and one year later became superintendent of the Maryland Division of the Philadelphia, Wilmington and Baltimore. In 1893, he was appointed general superintendent of transportation of the Pennsylvania Railroad System and four years later was promoted to general manager, remaining in that position until 1903, when he was appointed to the newly created position of assistant to the second vice-president. Mr. Hutchinson's active service with the Pennsylvania Railroad covered a period of nearly fifty-one years.

Guy Hopkins.

GUY HOPKINS, who on April 6th, was elected vice-president of the Morgan's Louisiana and Texas Railroad and Steamship Company, a part of the Southern Pacific System, is a native of New Orleans. After his graduation from Stevens Institute of Technology at Hoboken, N. J., in 1895, with the degree of mechanical engineer, he returned to New Orleans and was appointed draughtsman in the shops of the Southern Pacific, shortly afterwards being promoted to the position of chief draughtsman in the steamship department.

His next position was that of assistant master mechanic, from which he was advanced to that of operating engineer in charge of the assembling, testing and economical loading and operating of the locomotives on the Louisiana Lines. In January, 1912, he was appointed president's representative at New Orleans, holding that position until July 30, 1913, when he was appointed acting general superintendent having jurisdiction over the Louisiana Lines of the Southern Pacific.

John G. Walber.

JOHN G, WALBER, who until recently, has been assistant to the third vice-president of the Baltimore and Ohio System in charge of the Wage Discipline and Employment Bureaus, has been appointed head of the new Bureau of Information of the Eastern Railways with headquarters at New York. The purpose of this Bureau will be to collect, tabulate and keep up to date, rates of pay, rules or service and working conditions generally, affecting railway employes throughout the country, in such classes of service as may be hereafter decided upon.

Data of this character was originally collected in connection with the arbitration proceedings of the engineers', firemen's, conductors' and trainmen's cases by the Conference Committee of Managers, and it is the purpose of the new Bureau to continue such records and to keep authentic information of this character for the use of the members of the Bureau. The centralization of this effort, which has heretofore been exerted by each individual road, will it is believed, produce more reliable results in a more economical manner. No member of the new Bureau commits his company in any way to joint proceedings concerning wages.

Mr. Walber started his railroad career in 1885, as clerk with the Ohio and Mississippi. One year later he secured a clerkship in the office of the president and general manager of the same road,

J. G. WALBER.

and when this line later became part of the Baltimore and Ohio System, he was appointed secretary to the second vice-president and traffic manager, with headquarters at St. Louis.

In March, 1899, he was promoted to the chief clerkship in the office of the vice-president and general manager of the Baltimore and Ohio Southwestern at Cincinnati, and later was advanced to the position of assistant general manager. Mr. Walber was transferred to Baltimore from Cincinnati, becoming general superintendent of transportation and assistant general manager. In 1912, he was appointed assistant to the third vice-president with duties as above noted.

J. L. West.

J. L. WEST has been promoted from the position of general freight agent to that of freight traffic manager of the Missouri, Kansas and Texas, with headquarters at Dallas, Texas. He will also maintain an office in St. Louis. Mr. West's entire railway career has been with the Missouri, Kansas and Texas. He entered the service at Parsons, Kansas, in 1889, and has successively held the positions of stenographer, chief clerk, commercial agent, assistant general freight agent and general freight agent, in the order named. His acquaintance with the patrons of the Missouri, Kansas and Texas is therefore very extensive and he is thoroughly familiar with all the various traffic conditions in the territory traversed by his line.

C. B. Sudborough.

CHARLES B. SUDBOROUGH was born in St. Louis, Mo., November 1, 1876. He entered the service of the Vandalia Railroad Company as Register and Mail Clerk in the Freight Claim Department, September 1, 1897.

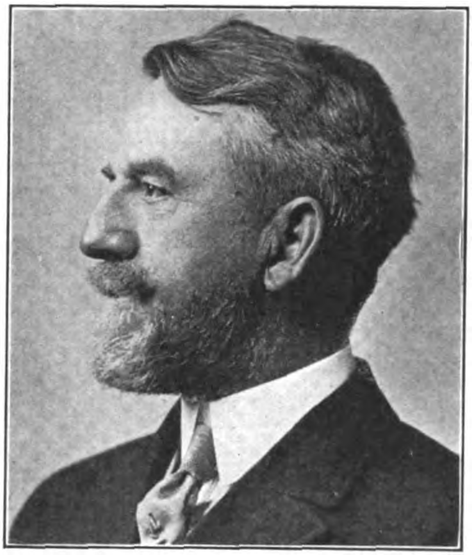
Mr. Sudborough was made freight rate quotation clerk in the office of the general freight agent on February 15, 1899; bill of lading clerk, commercial office, July 1, 1901; freight solicitor, commercial office, February 1, 1904; and chief rate clerk, general freight office, April 1, 1905. He resigned on June 15, 1906, to accept position of traffic manager for a large manufacturing concern located at St. Louis, Mo., but returned to the service of the Company as chief rate clerk, March 1, 1907.

C. B. SUDBOROUGH.

He was appointed division freight agent at St. Louis, Mo., on October 1, 1909, and served in that capacity until March 23, 1914, when he was promoted to assistant general freight agent.

James Russell.

JAMES RUSSELL, who has been appointed assistant to the vice-president of the Denver and Rio Grande Railroad Company, with headquarters at Denver, Colo., was born in 1865. He entered railway service on the Grand Trunk Railway, and was agent and operator for that road from 1879 to 1882; subsequent service, telegraph operator C. St. P. M. & O., Kansas Pacific, and Santa Fe, from 1882 to 1883; Canada Southern and Michigan Central, as telegraph operator and train dispatcher from 1883 to 1887; St. P. M. & M. and Great Northern Railways, train dispatcher, chief dispatcher and superintendent from 1887 to 1903; Missouri Pacific, superintendent from 1903 until 1907; Chicago, Burlington & Quincy Railway, superintendent from 1907 until 1909; Spokane, Portland & Seattle Railway, general superintendent, from 1909 until 1914; Great Northern Railway, general superintendent, from January 1st until February 19th, 1914.



Charles Hansell.

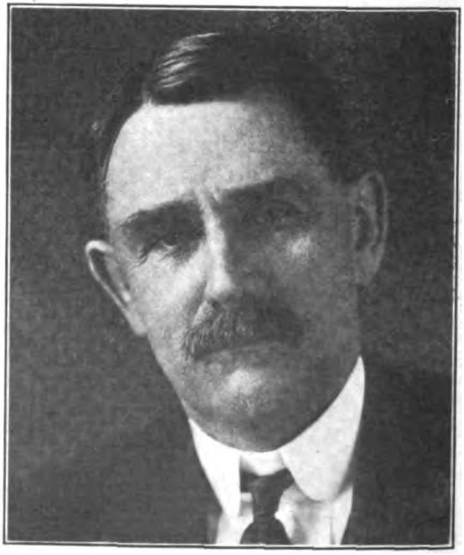
CHARLES HANSELL, in addition to his recently acquired duties as consulting engineer of valuation of the Pennsylvania Railroad, has been made chairman of the valuation committee of the Philadelphia and Reading Railway and the Central Railroad of New Jersey, and also consulting valuation engineer for the direct administration of the work of valuation to be conducted on these several properties.

Mr. Hansell has had a wide and varied experience which splendidly fits him for his new position. For four years he was locating and constructing engineer for the Denver and Rio Grande Railroad, and was division engineer for this Road in charge of the building of its first division into New Mexico. He was chief engineer of the Wabash Railroad at the age of twenty-five and remained in that position from 1844 to 1889, during that time he originated the premium system for inspection of railroads which has since been adopted throughout the United States. He was the first consulting engineer of the Railroad and Warehouse Commission of Illinois, and was sent by that State to Europe to report on railroads. He was also commissioner to Europe for the World's Columbian Exposition.

As vice-president and general manager of the National Switch and Signal Company, he installed important signal work on all trunk lines in America and also installed the first automatic signal system and power interlocking plant in England. In 1909, Governor Fort, of New Jersey, appointed Mr. Hansell commissioner to appraise railroad and canal properties in that State. The Legislature of New Jersey in 1910, decided to have the work of revaluation of railroads and canals conducted by one commissioner, and appointed Charles Hansell. This valuation involved the question of determining the value of the franchise and Mr. Hansell's methods not only won the high approvement of Government officials, but was commended by railway officials as being both fair and scientific. He is a member of the American Society of Civil Engineers, the Engineers' Club of New York and a member and past-president of the Chicago Engineers' Club. He is a fluent writer and a contributor to various technical journals.

Charles A. Morse.

CHARLES A. MORSE, who has been appointed chairman of the Valuation Committee of the Chicago, Rock Island and Pacific Railroad, was born January 1, 1859, at Bangor, Me. He graduated in June, 1879, from the Maine State College of Agriculture and Mechanical Arts (now the University of Maine) and began railway work for the Chicago, Burlington and Quincy in May, 1880. He remained with this road until November, 1881, the last year in the capacity of division engineer in charge of construction. His next position was with the Mexican Central Railway at Juarez, Mexico, and at the time he became associated with this line, they had but one engine and one mile of track. During his period of employment which lasted until March, 1884, connection was made between the North and South ends, 750 miles south of Juarez. In the position of division engineer of construction he was actively engaged in the building of this line. He again entered the service of the Chicago, Burlington and Quincy in May, 1884, as division engineer



CHARLES A. MORSE.

on construction and in January, 1886, began work from the Santa Fe, with which road, with the exception of one year, he remained continuously until April, 1913, occupying consecutively the following positions: Division engineer on construction, resident engineer, principal assistant engineer, assistant chief engineer, acting chief engineer and finally chief engineer of the entire Santa Fe System. From April, 1913, to date, he has been chief engineer of the Rock Island Lines.

D. B. Carson.

D. B. CARSON has been promoted from the position of assistant general manager to that of acting general manager of the Nashville, Chattanooga and St. Louis Railway. Mr. Carson's first railroad experience began with the Louisville and Nashville in 1876, as operator. He stayed with this Company but a short time, leaving it to accept a similar position with the Nashville, Chattanooga and St. Louis. Later he became relief agent and operator for this Road, from which position he was appointed to that of assistant train dispatcher, and in 1881, was made agent at McMinnville, Tenn. In this position, he was not long in demonstrating his ability, and was soon promoted to the position of traveling freight agent, besides being assigned by the management to various work in the different departments, which familiarized him with the operation of the entire system. In 1898, Mr. Carson was made agent at Atlanta, Ga., and on January 1, 1913, was selected for the position of assistant general manager.

D. B. CARSON.

George D. Brooke.

GEORGE D. BROOKE, recently appointed superintendent of the Baltimore and Ohio Railroad at Chillicothe, Ohio, entered the service of this Road in 1892, as rodman in the engineering department, later becoming levelman and transitman, then assistant engineer in May, 1904. He was advanced to the position of assistant division engineer at Pittsburgh on July 1, 1908, and a year later, became division engineer at Baltimore. Mr. Brooke was appointed special agent of the operating department in March, 1911, and February 1, 1912, was promoted to assistant superintendent of the Cumberland Division at Keyser, W. Va. He was promoted to superintendent of the Shenandoah Division with headquarters at Winchester, Va., September 15, 1912, and to his present position April 8, 1914.

GEORGE D. BROOKE.

Maury Middleton.

MAURY MIDDLETON, who has recently been promoted to the position of assistant cashier of the Southern Railway Company, was born in Washington, D. C., in 1880. He entered the service of the Southern Railway in May, 1899, as clerk in the treasurer's office.

MAURY MIDDLETON.

In October, 1908, he was appointed assistant cashier, which position he held at the time of his recent appointment as assistant treasurer and assistant cashier.

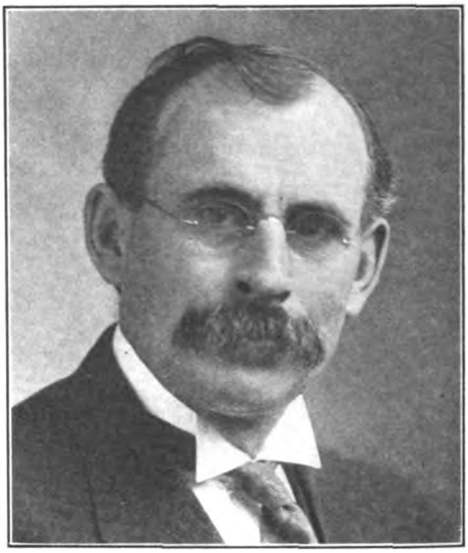
C. R. Craig.

C. R. CRAIG, formerly purchasing agent of the Mobile & Ohio Railroad at Mobile, has been appointed purchasing agent of the Southern Railway Company, to succeed F. S. Wynn, promoted to be secretary. Mr. Craig was born in Richmond, Va., in 1872. He entered the service of the Richmond & Danville in 1889 and remained with it and the Southern Railway in the supply department at Richmond until 1897, when he was made storekeeper at Selma, Ala. In 1898 he was made storekeeper at South Richmond, and in 1903 was detailed to the assistant general manager's office in Washington in charge of material and supplies. In 1905 he was made purchasing agent of the Lenoir Car Works, which position he held until 1909, when he was made purchasing agent of the Mobile & Ohio Railroad.

W. H. Olin.

PROFESSOR W. H. OLIN has been appointed commissioner of agriculture for the Denver and Rio Grande Railroad. This is an entirely new departure for the Rio Grande and marks a new era of agriculture in the territory served by that line.

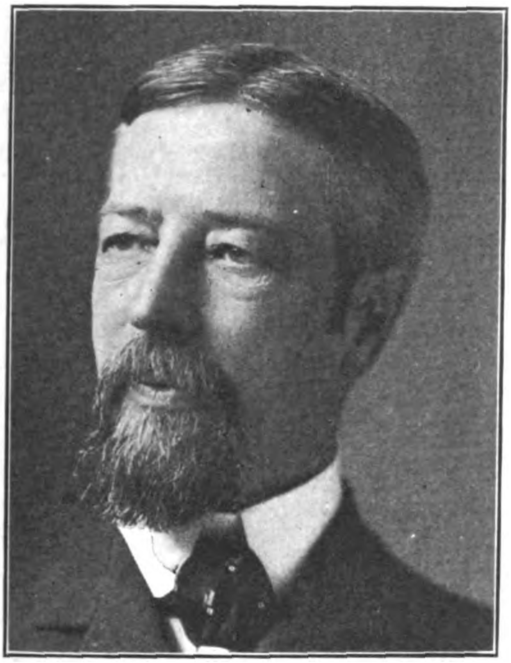
Professor Olin is a practical as well as a scientific farmer. He is a native of California, was raised on a farm in Kansas, and graduated from the State Agricultural College of Kansas, in 1889. He was principal of High Schools and superintendent of city schools at various points in Kansas until 1902. In 1902-4 he was Instructor in Farm Crops at the Iowa State Agricultural College, Ames, Iowa, and there had charge of experimental crop work of Iowa Station. In 1904-7 he was Professor of Agronomy in Colorado Agricultural College, Fort Collins, and in 1907-9 Vice-Dean of Agriculture in the same institution. He had general supervision of the field station crop work of Colorado Station in 1904-9. In 1909-11 he was Industrial Commissioner of the Denver, Laramie & Northwestern Railway. From 1911 to the present time he has been Director of Agricultural Extension Work in the University of Idaho, Boise.



W. H. OLIN.

Obituary

George Frederick Baer, president of the Philadelphia & Reading Railway and the Central Railroad of New Jersey, died at his home in Philadelphia, April 26th. He was born at Lavansville, in Somerset County, Pa., September 26, 1842, and was educated in Franklin and Marshall College. Years before entering that institution, however, he worked as a boy, just in his 'teens, in the printing office of "The Somerset Democrat," of which paper he and his brother afterward became the owners and editors. In 1862 he organized a volunteer company, of which he was made captain, and with it he fought with the Army of the Potomac, at the second battle of Manassas, at Chancellorsville and elsewhere, rising to the rank of adjutant general of brigade. In 1864 he was admitted to the bar and settled at Reading, Pa. In 1870 he prosecuted an action for damages against the Reading Railroad so ably and successfully that he was made counsel for the Philadelphia & Reading. As his law practice increased, he was able to extend the field of his operations, and so successfully did he embrace the opportunities offered to him, that he became an important factor in many industrial and financial enterprises, and especially in coal producing railroad so ably and successfully that he was made confidential adviser of J. Pierpont Morgan. He co-operated with him in the plan to unite under one management all the coal-carrying railroads with terminals in New York City. When the reorganization took place in 1901, Mr. Baer was elected president of the Reading Company, the Philadelphia & Reading Railway Co., the Philadelphia & Reading Coal & Iron Co., and the Central Railroad Co. of New Jersey. When the great anthracite coal strike began on May 12, 1901, he conducted the fight against the United Mine Workers of America. It was a long and desperate fight and a man of weaker and more yielding character would have succumbed under the strain. He remained on duty almost day and night, and, believing himself to be in the right, absolutely refused to yield a single point. Mr. Baer was always a hard worker. He was intensely religious, charitable and almost ascetic in habits. As one of the great captains of industry during a period remarkable for the conflict of big business with the Federal Government, Mr. Baer will live in history. The Philadelphia "Press," in commenting on his notable career, says: "Philadelphia and Pennsylvania have lost a useful and beloved citizen whose



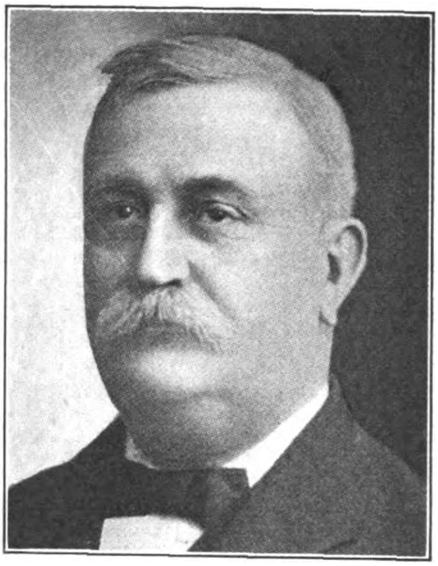
George Frederick Baer.

sincerity of purpose, integrity and honorable conduct have never been questioned by his most vigorous opponents."

Emil Gerber, assistant to the president, and general manager of the erecting department of the American Bridge Co., died at his home in Pittsburgh, Pa., April 16, 1914. Mr. Gerber's death came as a severe shock and personal loss to the large number of friends who admired his sterling worth and felt for him that affection which his personality so readily inspired. The deceased had held, at various times, many responsible positions. He had been connected with and had had charge of a large amount of important work and he made a success of everything he undertook; yet a mere review of his successful life would give an inadequate conception of his place in the engineering profession and in the American Bridge Co. In the course of his career he had a large range of experience and the advantage of intimate association with such men as Ainsworth, Morison, Noble and Ziesing which, combined with his natural ability, gave him breadth of view, soundness of judgment, stability of character and ever-present poise. Mr. Gerber was born at Reichendach, Saxony, Germany, January 31, 1858. He was graduated from the Worcester Polytechnic Institute, Worcester, Mass., class of 1876. After graduation he taught school for one year at Southbridge, Mass. Subsequently he was assistant engineer in the location and construction of the Freemont, Elkhorn & Missouri Valley Railroad. In 1879 he was appointed assistant engineer of the Sioux City & Pacific Railroad, now a part of the Chicago & Northwestern Railway. As resident engineer he had charge of construction of the Blair bridge, Missouri Valley, Iowa, the Sioux City bridge, Sioux City, Iowa, and Jacksonville bridge, at Jacksonville, Fla., which bridges were designed by the late George S. Morison, consulting engineer. In 1889 he was made principal assistant engineer to George S. Morison, resigning in 1897 to accept the position of chief engineer of the Lassig Bridge & Iron Works of Chicago. He was manager of the Lassig plant during the years 1900 and 1901, and was then appointed assistant to the president of the American Bridge Co., at Pittsburgh, also serving as operating manager of the Pittsburgh division of the American Bridge Co., from 1905 to 1911. During the years 1910 and 1911, the construction of the Gary plant of the American Bridge Co. was under his direction. In 1911, in addition to his duties as assistant to the president, Mr. Gerber assumed duties of the general manager of the erecting department. Mr. Gerber has been identified with the construction of many of the largest bridges in the United States. He was a member of the American Society of Civil Engineers, of which he was also a director; of the American Railway Engineering Association; the American Iron & Steel Institute; the Western Society of Engineers; the Engineer's Society of Western Pennsylvania; the Chicago Engineer's Club, the Duquesne Club and the Junta, Pittsburgh. Recently he was appointed on a joint committee of the American Society of Civil Engineers and the American Railway Engineering Association, on railroad tracks and roadbeds. Mr. Gerber is survived by his wife, his daughter, Mrs. Albert Olsen and son, Emil.

Emil Gerber.

Alfred Noble, chief engineer of the Pennsylvania Tunnel & Terminal Railroad, and a former president of the American Society of Civil Engineers, died April 19th, at St. Luke's Hospital, in New York City. Mr. Noble was born in Michigan, August 7, 1844, the son of Charles and Lovine Noble. He served three years in the Army of the Potomac. He was graduated from the University of Michigan in 1870 as a civil



Alfred Noble.

engineer, and for the next twelve years was in charge of improvements in the St. Mary's Falls Canal and St. Mary's River. From 1883 to 1886 he was general assistant engineer of the Northern Pacific Railway, and for some years after that was in charge of the construction of railroad bridges in various parts of the country. Mr Noble was a member of the Nicaraugua Canal Board in 1895, of the United States Board of Engineers on deep waterways in 1899 and 1900, ot the Isthmian Canal Commission from 1899 to 1903, of the Board of Consulting Engineers of the Panama Canal in 1905, and was chief engineer of the East River Division of the Pennsylvania, New York & Long Island Railroad and successor from 1902 to 1907. This company and the Pennsylvania, New Jersey & New York Railroad, in 1907, became the Pennsylvania Tunnel & Terminal Railroad, organized to build the electric division of the Pennsylvania Railroad including the tunnels under the Hudson River. For his work at this time Mr. Noble received the John Fitz medal. In May, 1912, he received the Elliott Cresson medal from Franklin Institute at Philadelphia. He was president of the American Society of Civil Engineers in 1903, and of the Western Society of Engineers in 1897.

William Apps, former master car builder of the Algoma Central & Hudson Bay Railway, died at his home in Toronto, Ont., March 21st, aged 67 years. Previous to his connection with the Algoma Central & Hudson Bay, 1902 to 1903, Mr. Apps had been master car builder of the Canadian Pacific Railway from 1895 to 1902.

Samuel F. Barger, formerly, from 1869 to 1909, a director of the New York Central Lines, died on April 7th at his home in New York at the age of 82. Mr. Barger had been in failing health since his retirement from active business eight years ago. He was born in New York City and studied law at the College of the City of New York. He was admitted to practice in both the States of New York and New Jersey at the age of eighteen years and soon rose to prominence as a corporation lawyer.

Joseph Judson Brooks, general counsel of the Pennsylvania Lines West of Pittsburgh, with office at Pittsburgh, Pa., died suddenly in that city on April 11th. Mr. Brooks was born in 1845 at Salem, Ohio, and graduated from Yale University and Cambridge Law School. In 1881 he became assistant counsel of the Pennsylvania Lines West of Pittsburgh and since 1893 had been general counsel of the same lines.

William G. Bullit, formerly a vice-president of the Norfolk & Western Railway, died in Philadelphia, Pa., March 22nd, aged 58 years.

Warder Cummings, formerly from 1881 to 1886 general superintendent of the Texas & Pacific at Marshall, Texas, and recently terminal agent at Denison, Texas, died at his home in the latter city on April 9th, aged 75 years.

John N. Faithorn, former president and general manager of the Chicago Terminal Transfer Railroad, died at Chicago, March 28th, following a long illness. Mr. Faithorn was born in London, England, March 21, 1852. He was educated in St. Mark's College, London. When a boy he came to the United States with his parents, and when twenty years old took up railroad work, his first position being that of clerk in the offices of the Chicago & Alton Railroad. In 1882 he was made auditor of the Southwestern Railway Association. He was appointed chairman of the Southwestern Railway and Steamship Association in 1890. In 1893 he was made general manager of the Wisconsin & Michigan Railway and five years later he was made president and general manager of the St. Louis, Peoria & Northern Railway. He was vice-president of the Chicago & Alton Railroad from 1902 to 1904 and from August 1, 1899 to 1910, he was president and general manager of the Chicago Terminal Transfer Railroad. He has since been president of the Faithorn Company, printers and manufacturing stationers, in Chicago.

James L. Frazier, civil engineer, formerly connected with the engineering and operating departments of the Chesapeake & Ohio, Southern Pacific, Toledo, St. Louis & Western and other lines, died in Rome, Italy, on February 28th. Mr. Frazier was born at Staunton, Va., in June, 1849, and was educated at Washington and Lee University, and the University of Virginia, graduating from the latter school in civil engineering. He was engaged on the Cincinnati Southern during its entire construction, having charge of the bridges on that line; later he was in charge of bridges on the Louisville, Evansville & St. Louis, now the Southern, and was in Mexico on the lines of the Mexican National Railways. He was at one time a director of the American Society of Civil Engineers. He was division engineer and later chief engineer and general superintendent of the Chesapeake & Ohio at Louisville, Ky., for a number of years. Following this he served as superintendent of several of the divisions of the Southern Pacific. He resigned from the Southern Pacific to become general superintendent of the Toledo, St. Louis & Western, later leaving that company to become general manager of the California Northwestern and the North Shore, at San Francisco. While with the latter company, his health became permanently impaired following a serious illness, and he retired from active work in 1905, since which his time has been spent partly in this country, but principally in Europe. He was a man of strong character and held in high esteem by a large circle of his acquaintances.

J. C. Higgins, superintendent of Atlantic Coast Line Railroad, at Sanford, Fla., died in that city April 3rd, aged 54 years.

William H. Hosmer, chairman of the Western Trunk Line Committee at Chicago, died in that city on April 21st, of pneumonia. He was also chairman of the Illinois Freight Committee, the Gulf Foreign Freight Committee and the Illinois-Indiana Coal Traffic Bureau. He was born in Boston in 1869 and had been continuously in the service of the Western Freight Association, and its successor, the Western Trunk Line Committee, since 1880, having begun as a clerk.

W. J. Hunter, division freight agent of the Grand Trunk Pacific Railway, at Winnipeg, Man., died April 8th, after a short illness.

Thomas H. Johnson, consulting engineer of the Pennsylvania Lines West of Pittsburgh, died at his home in Pittsburgh, Pa., April 16th. Mr. Johnson was born January 12, 1841, in Coshocton, Ohio, the son of William Kerr Johnson and Elizabeth Humrickhouse, and was graduated from Jefferson College, now Washington and Jefferson College, with the degree of Bachelor of Arts, in 1861, the degree of Master of Arts being conferred upon him in 1866. He entered railroad service as a rodman in 1863. From 1864 to 1865, he was assistant engineer of the Pana, Springfield & Northwestern Railroad and served consecutively as engineer in various departments on the Pittsburgh, Cincinnati, Chicago & St. Louis Railway; civil engineer and architect at Columbus, 1873 to 1875; engineer for contractors of the Indiana state house; principal assistant engineer and chief engineer of the Pittsburgh, Cincinnati, Chicago & St. Louis Railway and consulting Engineers, the Engineering Society of Western Pennsylvania. Mr. Johnson was a member of the American Society Civil Engineers, the Engineering Society of Western Pennsylvania, Natural Geography Society, Technischer Verein, Phi Kappa Psi, and other fraternal and scientific organizations.

William Kline, formerly superintendent of telegraph of the Lake Shore & Michigan Southern, at Toledo, Ohio, died in that city on March 19th, at the age of 78. He was born at Albany, N. Y. After leaving school he became a messenger in Buffalo, and later entered the service of the Southern Michigan & Northern Indiana at Adrian, Mich., afterwards becoming chief operator. On the consolidation of the various independent railroads into the Lake Shore & Michigan Southern, Mr. Kline was appointed superintendent of telegraph with headquarters at Toledo. He retired from this position about four years ago.

Joseph Lomax, first president of the Grand Rapids & Indiana Railway, formerly newspaper publisher and lawyer, died recently at the home of his daughter in Indianapolis, Ind. He was 104 years old last December.

William O'Herin, assistant to the general manager of the Missouri, Kansas & Texas System, with headquarters at Dallas, Texas, died at the Mercy Hospital, Chicago, March 31st, aged 69 years. He has been connected with the Missouri, Kansas & Texas for forty years, beginning as a locomotive fireman. He was later locomotive engineer and subsequently became master mechanic. He was promoted to superintendent of machinery and equipment in 1897, which position he held until January 1, 1913, when he was made assistant to the general manager.

Arnold D. Perry, former general agent of the Chicago & Alton Railroad, at Peoria, Ill., died recently in Bloomington, Ill., aged 61 years.

C. G. Phillips, president of the Cropley-Phillips Company, of Chicago, and secretary of the Association of American Railway Accounting Officers since the organization of that association in 1887, died at his home in Evanston, Ill., April 17th.

Daniel P. Sheehan, roadmaster of the Metropolitan West Side Elevated Railway, Chicago, died in that city April 27th. He was crushed by a derrick on which he was sitting, when he leaned over to warn a track laborer who was in a dangerous spot. Mr. Sheenan did not note his own danger and was fatally injured.

John R. Skinner, superintendent of stores of the Delaware & Hudson Company at Oneonta, N. Y., died suddenly on April 6th, at his home in that city.

Charles F. Smith, division superintendent of the Oregon Short Line Railroad, at Pocatello, Idaho, died at the home of his parents in Niagara Falls, N. Y., March 30th. He had been granted a leave of absence by the Oregon Short Line last November, due to ill health.

Cy Warman, the popular writer of railroad stories, died in Chicago, April 7th, aged 59 years. His early experiences as an engine wiper, fireman and locomotive engineer were later turned to good account. He saw the interest and romance of railroading. Though his material was rejected at first, stories of the road began to appear at length and proved immensely popular. His most successful work was "Tales of an Engineer."

Edward White, formerly from 1885 to 1898, treasurer of the Erie, with office at New York, died at his home in Brooklyn, on April 12th, at the age of 70.

Aaron J. Zabriskie, a civil engineer and railway builder, died on April 15th, at his home in Jersey City, N. J., at the age of 60. He was graduated from the Polytechnic Institute at Albany, N. Y., in 1876, and was later engaged in the construction of the Ninth Avenue elevated line in New York City, which was the first elevated road built in that city, and afterwards was engaged in construction work on the Erie Railroad.

Closing Arguments in the Advance Rate Case

THE final arguments in the advance rate case were heard by the Interstate Commerce Commission during the last week of April. Comprehensive briefs were filed by the carriers. In a compilation dealing with returns for the first eight months of the current fiscal year, there is shown a decrease in revenues of $21,161,824. The statement, covering the result for this period, was in part as follows:

> During the period from July 1, 1913, to February 28, 1914, the revenues of these companies decreased from $931,508,361 to $910,346,537 as compared with the previous year. For the same period expenses increased from $645,404,193 to $683,364,514. There was thus a decrease in revenues of $21,161,824 and an increase in expenses amounting to $37,960,321, or a loss in net operating income of $59,122,145. When to the foregoing fact is added an increase in taxes of $2,507,471 and a decrease in net revenue from outside operations, there is shown a loss in operating income of $69,355,881, or 26%.
>
> Assuming that no additional money has been invested in these properties since July 1 of last year, the returns for the current eight months show 4.47% earned on property investment, as against 5.53% in the corresponding eight months of last year. The Pennsylvania System in the same period shows 4.92%, as against 5.56% in 1913. The New York Central Lines show 3.56%, as against 5.63% in 1913. The Baltimore and Ohio System shows 4.10%, as against 4.63% in 1913. The Erie System shows 2.75%, as against 3.91% in 1913. The Pennsylvania Railroad System, Baltimore and Ohio System and New York Central Lines show 4.23%, as against 5.44% in 1913.
>
> The rate of return on property investment that is shown by all these railroads for this portion of the present year is the smallest of any year in the last fifteen years.

A brief summarizing the position of the roads devoted considerable attention to the purely economic features of the case. It set forth that the purchasing power of money has so decreased in the past eighteen years "that the purchasing power of the moneys now paid for freight on the railroads of the country generally was in 1912 approximately 30 per cent less in the market for commodities than it was in 1896." The brief sets out that:

> The railroads are still required to sell their services at rates to pay even less than those established years ago, after competition had forced them to a low level, and to take their pay in a depreciated currency, while they must pay their labor, buy their materials, borrow their capital and pay their taxes on the basis of present-day commodity prices.
>
> We have shown a steady decline in the return on the money which has gone into the transportation plant, i. e., the road and equipment. We have shown (a) that in the period 1903 to 1913 the net operating income per cent (of the thirty-five roads embraced in this proceeding) on the money which went into the property investment account was an amount equal to 4.31% in 1913 over 1910. The rate of return on property investment was 5.85% in 1903, 6.28% in 1910 and 5.36% in 1913.
>
> Comparing 1913 with 1910, the combined property investment increased $659,862,588, while operating revenue increased $186,775,867. Including taxes, which increased over $11,579,165, expenses increased more than $201,301,462, so that net operating income decreased $16,311,000, or nearly 5%. In other words, after increasing investments 11.74% and gross revenues 15.09%, there was no resultant increase in net operating income; on the contrary, there was realized $16,311,321 less net than was earned before the $659,862,588 was added to the property investment.
>
> There has been a steady and constant increase in transportation, maintenance of way and maintenance of equipment expenses, an increase not temporary, but of a continuing character due to the nature of the underlying causes, such as the increase in wages, legislative requirements and the necessity of maintaining a higher standard of track and equipment. The operating revenues of the carriers are inadequate to keep pace with this increase in expenses, and, accordingly, the money expended in procuring necessary facilities has earned an utterly inadequate return since 1903, and no return at all since 1910.
>
> The effect of these things is that at a time when the business of these carriers is larger in volume than ever before in their history, at a time when their capital obligations are the largest ever recorded and their plant and equipment more complete and more efficient than ever before, they find themselves face to face with a declining net income. They are, moreover, now without the potentiality of further operating economies, such as they have been able thus far to put into effect, and which have, until but recently, held in check in the forces beyond their control, and these are now operating in full strength to diminish profits. The situation disclosed in the figures for 1913 which are before the Commission is serious, but a truer reflection of the actual facts is found in the figures so far available for 1914, for it is only now that the full effect of the factors operating to diminish the carriers' profits is beginning to appear.
>
> It is generally conceded that within the next few years, if our means for transportation by rail are to keep pace with the calls upon them, very large sums must be expended in the way of new construction and new equipment. While some small portion of this may come from current earnings, the great bulk must be new capital and this capital must be obtained from the investing public. If, therefore, we are to rely in the future, as we have in the past, upon private enterprise and private capital for our railway transportation, the return must be such as will induce the investment. It is therefore not only a matter of justice, but in the truest public interest, that an adequate return should be allowed upon railway capital.
>
> Unless the railroads are permitted to increase their revenues by a reasonable increase in their rates for transportation services so as to help meet the large and permanent increase in the cost of capital, wages, taxes and other expenses, then it will be only a question of time when there will result not merely the reduction or suspension of dividends, but also in some cases at least a default in the payment of interest and other obligations. Unless the railroads are able to receive rates for their transportation services that will produce net revenues sufficient to meet reasonable dividend requirements and leave a reasonable surplus as a margin of safety to help defray the "cost of progress," secure the future stability of rates, establish confidence in the continuance of dividends and otherwise maintain credit, there is but little ground to believe that private investors will afford the necessary new capital.
>
> Diminished surplus earnings prevent the creation of adequate reserve funds unless dividends be curtailed or suspended. Curtailments of dividends would aggravate the situation, while suspension of dividends would make it increasingly difficult to obtain any capital even by the sale of bonds, and where obtainable by bonds sales it would only be at much higher rates of interest. Total suspensions of dividends by all the railroads, though it would produce a great panic, would not produce the amount of new capital required.

In opening the argument for increased freight rates George Stuart Patterson, General Solicitor of the Pennsylvania Railroad, addressed the Commission on "The Need of the Carriers for Additional Revenue," and in part said:

> "During the past ten years, for the thirty-five railroad systems in this proceeding—
>
> "Property investment has increased 46.04%;
> "Capital obligations have increased 49.22%;
> "Operating revenues have increased 63.54%;
> "Operating expenses have increased 74.80%; and
> "Taxes have increased 111.43%.
>
> "During this same period—1903-1913—there has been—
>
> "(*a*) A decline in the ratio of net operating income to property investment;
>
> "(*b*) A decline in the ratio of net operating income (plus interest on funded debt) to total capital obligations;
>
> "(*c*) A decline in the ratio of surplus to total capital obligations.

"All of this shows a decided weakening in the position of the carriers as regards their return on investment, despite the growth in the size of the plant, volume and density of the business, and the facilities and improved methods of handling that business.

"Thus during the last ten years the carriers find themselves, after a period of great growth and expenditure of new capital, worse off than they were before this growth and expenditure, though they should be materially better off.

"The importance of this showing for the period 1903 to 1913 is greatly increased by the fact that the tendencies which operated during that period to decrease the return on the investment are operating with even greater force in the last three years.

"The figures reflect an acceleration in the rate of decline in recent years. They show the lowest rate of return, and the lowest surplus in the last three years, and the year 1913 shows the lowest figure for any of these years. If it be remembered that these three years are the biggest three-year period in the carrier's history, and that 1913 was in itself the largest of the three, then the full significance of the showing becomes apparent.

"The view has been suggested that the net revenues for 1913 were larger than for any of the last five years, except 1910, and, therefore, negative any inference that the carriers' revenues are inadequate or that they have reached a crisis in their affairs. In 1913 not only were the facilities the largest in the history of these carriers, but the use of them was the greatest, and practically to their full capacity. When a comparison of 1913 with 1910 shows that, despite the expenditure of over $659,0000,000 on property and an increased use yielding $186,775,000 increased operating revenues, the net operating income decreased $16,311,000; then, that comparison, the carriers urge, does prove the inadequacy of their revenues and that the results so shown are not such as to fairly justify the expenditure of additional capital for the further provision of similar facilities.

"It is an absolutely new thing in the history of American railroading for a year like 1913, or a period like 1910-1913, when traffic was the largest ever recorded for a similar period of time, to show the position of the owners of the property to be worse off than any previous years or periods. It is strong and conclusive evidence that some change has taken place in conditions, nor is it difficult to see what this change is, and what has brought it about. It will be disclosed by the collateral lines of inquiry, namely increased cost of operation and increased cost and difficulty of securing new capital. There has been a steady increase in transportation, maintenance of way and maintenance of equipment expenses, which are continuing in character, and the full effect of which is just beginning to be felt."

O. E. Butterfield, General Solicitor of the New York Central Railroad, also argued on the needs of the railroads. He declared that the railroads have experienced constantly increasing difficulty in recent years in securing necessary new capital, and where they are able to make the new securities for that purpose they are unable to do so except at substantially lower prices or upon substantially higher basis. He also stated that—

"If the railroads are not allowed to charge such rates for their services as will produce a proper return on the money invested, then how long will those responsible for the management of these properties be justified in continuing large expenditures of new capital for additional facilities and equipment, even if such capital were available at reasonable rates of interest? Have they not a duty to perform to their shareholders and to those whom they have induced to purchase their securities which must be considered as well as their desire to furnish better and additional transportation facilities for the use of the public?"

J. L. Minnis, General Counsel for the Wabash Railroad, presented a special argument in reference to the meaning and purpose of our national laws regulating railroads, in which he said:

The question presented here is not the ordinary question involved in an attack upon the reasonableness or unreasonableness of a rate—it is a question of giving effect to a great public policy. The concrete question to be decided is whether present rates have produced and are now producing sufficient revenue to the companies to justify the belief that much needed new capital may be obtained from private investors on reasonable terms. The only object of investing money is personal gain. Private capital is timid and often influenced by misapprehensions and unfounded suspicions. Investors' owe no duty on the premises, and do not act by compulsion, but invest voluntarily if at all.

Many misapprehensions with respect to the purposes of the Act to Regulate Commerce have been hurtful to railroad credit. By some it has been assumed that a share of the managements of the railroads has been vested in the Commission, when in fact, notwithstanding that the many public abuses which provoked the enactment of the law were due to private management, the law left the management with the investors represented by the companies. Others have assumed that the power vested in the Commission was designed to prevent the companies from earning a return on watered securities, when in fact, notwithstanding the rank abuses attending the financing of the companies by private investors—although likely not more scandalous than attended the transactions of the Government and the States in aiding the construction of the early railroads—Congress has not, directly or indirectly, exercised any authority on that subject; in fact, the legislation now pending in Congress on that subject is designed to safeguard future investments in the railroads.

The absence of an enactment in regard to abuses in connection with issuing securities, and the pendency of the present legislation, recognizes that Congress has in the past deemed it wise to allow a wide range of discretion in issuing railroad securities, with a view to encouraging private investments in railroads; and that it does not now regard it wise to further unsettle railroad credit by casting a cloud on the value of investments made in good faith in securities for which present value may not have been received. The harmfulness of the assumption that those securities are to be destroyed is obvious when we reflect that the supposition is that they are to be destroyed by the Government. It would be a slander on the Government to say that, while it preserves its own obligations as sacred, it has conferred power on this Commission, one of its instrumentalities, to destroy a large class of investments which our citizens have made in good faith.

* * * *

If the policy of the Government be executed, allowance must be made in the rates to cover the natural timidity of private capital, and if capital is to be acquired by the companies at reasonable interest, their rates must be high enough to foreclose questions as to the security of railroad investments. It will not reassure the investor to say that the companies might be more profitably managed. That would frighten them away, and if it may ever be truthfully said that the managements of the companies are incompetent and wasteful, it will mean that the policy of the Government has failed. So the question is not one merely of theories with respect to maintenance or efficiency or accounting, but it is a broad, practical, common sense question which must be dealt with on broad lines.

George F. Brownell, Vice-President of the Erie Railroad, speaking on the economic justification for an increase in freight rates, said:

If operating expenses and the new burdens imposed by law upon the railroads had not been enormously increased, they would now be in a highly prosperous condition, but it is the net income and not the gross that counts, and the adequacy of the net must be considered in connection with the amount of capital employed in the work and the aggregate amount of transportation service performed. The railroad industry is the nation's greatest industry, save only that of agriculture. In it is invested more than a tenth of the nation's wealth, and it gives direct employment, under normal conditions, to nearly two millions of the country's most intelligent and efficient workers, and indirectly to many more.

Until recent years it was, like other industries, responsive to the law of increasing returns, under which an increase in the volume of traffic would produce a decrease in the unit of cost, and operating revenues would increase more rapidly than would operating expenses. In those early years, like other industries, it was able to control its expenditures and increase its charges to meet changed conditions. All this has changed. It has lost in large measure its ability to control its expenditures. Because of its quasi public

> character it is subject to Governmental regulations and control to much greater extent than most other industries. It has been subjected to numerous requirements of legislatures and regulatory bodies, both Federal and State, which have increased greatly its operating and its capital expenditures. Many additional legislative requirements of this character are in various stages of incubation.
>
> The railroads are not here questioning the wisdom or expediency of these requirements, and will continue to the best of their ability to bear and sustain the financial burdens they impose; but they ask that they be not deprived of strength to accomplish the task—and remunerative rates are the very sinews of that strength. The railroad industry has ceased responding to that economic law; it has been forced to become an industry of decreasing returns. The increase in expenses and other burdens has also absorbed the savings from increased efficiency and from the investment of new capital. It is fast reducing net operating income to a point less than in previous years, when the business handled and the investment of capital were much less; and the prospect is that, upon the basis of existing freight rates, the rate of net return will continue to diminish, notwithstanding any further increase in the volume of business handled and in property investment.

Frank A. Lyon, speaking for the coal interests of the Pittsburgh and Hocking Valley districts, maintained that the railroads were the only great industry that did not conform to the principle of reduction of cost of service with the increase of business and modern means of handling its business. He said: "If this Commission does not stand as a bulwark to the consumer, the public will stand where it has always stood, at the mercy of the carrier, with the rates 'all that the traffic will bear.'"

Louis D. Brandeis, counsel for the Interstate Commerce Commission, filed a brief in opposition to the increase. He maintains that by conserving their revenues properly derivable under existing rates, the railways would be confronted with no necessity for an advance. It has been shown, he said, that the aggregate freight revenues of Eastern cariers in 1913 were $1,000,000,000, and that the five per cent advance would increase the revenues about $50,000,000 a year. In his brief Mr. Brandeis said:

> "It is true that railroad taxes have increased largely in recent years; but the increase has been general in all business, and the ratio of railroad taxes to gross revenues is still small. Railroads have, in common with other businesses, been necessarily affected by the increasing rates of interest generally prevailing in recent years. But it must be remembered that interest rates fall as well as rise, and we appear to have entered a period of declining rates."

Mr. Brandeis suggested that many railroads had strained their credit by "undue expansion" instancing the New Haven, Boston & Maine, Frisco Lines, Rock Island and Pere Marquette. He argued that the increase in the several elements of cost of operation of railroads did not account fully for the inability of the companies to earn adequate profits at existing rates; and that the general scale of wages on railroads had not increased more than in other businesses.

He contended that, while the railroads have shown greater efficiency in recent years in equipment and roadway, in accounting they are weak, as compared with manufacturers, and "do not know the cost of any of the services which they furnish." Of the five per cent advance, Mr. Brandeis said:

> It would intensify existing injustice and discrimination in rates. It would give additional revenues where relief is not needed and would fail to give adequate revenues to carriers who are most in need of relief. The investigations already make it clear that, by conservation, net revenues may be largely and speedily increased and that the sources available would yield revenues far in excess of the $50,000,000 which it was proposed to raise by tariffs filed.

In testifying before the Commission, Mr. Brandeis, while admitting that "the carriers need additional revenue in order properly to perform their own duties and promote the prosperity of the country," maintained that "the proposition to increase freight rates by horizontal increases is an unsound expedient." Steps, he said, should be taken, as soon as possible, to increase the carriers' revenues, and he suggested that testimony given at the Commission's hearings had shown how that might be done without advancing rates. He referred to the elimination of special allowances to shippers, free car spotting and other free services now performed by the roads. In stating that the horizontal increase sought was an unsound expedient, Mr. Brandeis said:

> No power is given to determine the property of a system of rates considered as a whole. Under the law the Commission must in effect deal with each rate separately and the carriers must justify each rate separately. Except as to the Central Freight Association scale, the railroads as shown above have presented no evidence whatever to justify any of the proposed increase of rates.

In concluding his arguments, Mr. Brandeis summarized his conclusions as follows:

> On the whole, the net income and net operating revenues of the railroads in official classification territory are smaller than is consistent with their assured prosperity and the welfare of the community, and this is notably true of the Central Freight Association and other lines. In view of this fact, it is desirable that steps should be taken as promptly as reasonably may be to increase this net revenue. That the method proposed by the carriers for increasing this net revenue is essentially unsound; that it is, except as to a small part of the tariffs which have been submitted, contrary to law, and would be, if approved, invalid and exceeding the powers vested by the Congress in this Commission; and, as to the small part to which it would be legal to approve them, it would be unwise to the carriers and to the community to approve them. That there is nothing in the conditions of the carriers which should prevent the adoption of those methods of increasing their revenue which are conformable and in accordance with their interests and those of the community, and that there exists, and have been indicated in this record, a definite means of increasing the revenues without resort to these unsound, largely illegal, and horizontal increases in rates.

Clifford Thorne, representing the Western Railroad Commissions, also filed a brief in opposition to the increase, and in part he said:

> The carriers have claimed an inability to properly take care of their properties because of lack of funds during recent years. The undisputed evidence in this case shows that they have, in fact, been able to expend larger sums for maintenance and improving their properties during the past four years than during any other four-year period in their history; and their expenditures of that character last year were $60,000,000 greater than ever before in their entire history. Tne carriers have claimed that interest charges have increased to such an extent that, with the increased cost of labor and supplies, they do not have an adequate surplus for the payment of dividends and for a margin of safety; that their net corporate income has not increased at the same rate as their capitalization. Their own exhibits show that the 35 systems, as a whole, in the Eastern district, had a greater net corporate income above all taxes and interest during the last five years than during the preceding five years. Further, that the per cent of net corporate income to outstanding capital stock was greater during the last five years than the preceding five years, and was greater in 1913 than the average for either one of the said five-year periods. The carriers claim that the present net profit or net corporate income, even at its high level, is not adequate. This Commission unanimously held in 1910

> that, in order to have sufficient revenue, a company should be able to pay its operating expenses and fixed charges, including interest, taxes, &c., and have a sum left over equivalent to 7½% on its common stock. The carrier's own exhibits in this case show that last year the railroads as a whole, in the Eastern district, had sufficient to meet all these expenditures and pay their operating expenses, fixed charges, taxes and interest, and had left over a sum equivalent to 8.07% on their entire capital stock outstanding, including both common and preferred.

Briefs in opposition to an advance in rates were likewise filed on behalf of the Pittsburgh Coal Company, the New Pittsburgh Coal Company, and some of the State Railroad Commissioners in the Eastern Classification Territory.

"Spotting" tariffs, which the railroads in Eastern territory filed to become effective May 1st and subsequent dates were suspended on April 29th, by the Interstate Commerce Commission until July 30th. These tariffs were filed by the roads to meet the assertion made in the advance rate case that charges should be assessed on services now performed free for shippers at terminals. An inquiry is now in progress to determine whether the allowances made by the trunk lines, as divisions of their rates, do not constitute, in a legal sense, rebates on shipments handled by the industrial roads.

A resolution, introduced by Senator La Follette on April 27th, requesting the Interstate Commerce Commission to transmit to the Senate all communications "manifestly designed" to influence the action of the Commission in its decision in the freight-rates advance case, was adopted by the Senate on the 28th; we print the resolution below:

> *Resolved*, That the Inter-State Commerce Commission be, and it is hereby, requested to transmit to the Senate of the United States all anonymous letters and communications and all written or printed letters and communications received with signatures thereto, and all circulars, clippings, newspaper or magazine articles, marked or otherwise, received by said Commission or any member thereof which were manifestly designed to influence the action of said Commission in making or refraining from making any ruling, conclusion, finding, recommendation, report, or order in the determination of the case known as Docket No. 5,860, entitled Revenues of Rail Carriers in Official Classification Territory, and in the case known as Investigation and Suspension Docket No. 333, entitled Rate Increases in Official Classification Territory, now pending before said Commission, excepting such letters, communications, briefs, records, and other matters as have been received by said Commission or any member thereof, under the rules and regulations of the Commission governing its proceedings in the orderly administration of the Inter-State Commerce Law and Acts amendatory thereof, from the officials, employees, and attorneys of the railroads parties to such proceedings, the attorneys, investigators, and employees of the Commission engaged in investigating and preparing said cases, and from the shippers and associates of shippers, individuals and attorneys who appear in the proceedings as protestants.

In the House on the 24th, a motion to table a resolution of Representative Levy calling upon President Wilson to report certain facts within the knowledge of the Commission on the freight rate matter was agreed to. The following is the Levy resolution:

> *Resolved*, That the President of the United States be, and he is hereby requested to report to the House of Representatives for its information, all the facts within the knowledge of the Inter-State Commerce Commission which show, or tend to show, that said Commission has in many cases failed to grant an increase in freight rates to the railroads where no objections to such increase have been filed, and where the shippers in many instances have requested that such increase be granted on the ground that it was just and reasonable.

What is at Stake in the Eastern Rate Case

SLASON THOMPSON, director of the Bureau of Railway News and Statistics, has issued his annual statement covering steam railway operations in the United States during the year ending June 30, 1913. It is a remarkable document covering the entire range of railway activities, and contains the latest statistics on mileage, equipment, number and compensation of employes, capitalization, cost of construction, ownership, freight and passenger traffic, earnings and expenses, taxes damages and injuries, locomotive fuel, accidents, railway receiverships, foreign railways, growth of railways at home and abroad and cost of railway regulation. Perhaps, however, the part of the report, which, at the present time will prove of greatest interest to railway officials is that which deals with the restrictive effect of regulation.

Mr. Thompson points out that when taxes are deducted from the net revenue for the calendar year 1913, the balance is found to be $41,000,000 below the net operating income for 1912. When reduced to a per mile basis, it appears that the figures for 1913 are below those for any other year since 1907 inclusive, except 1908. The true significance of these per mile figures can only be understood when it is remembered that the mile of line in 1913 represents a net investment of at lease $6,000 more than in 1907. That means that each mile has to earn at least $250, more to meet the increased interest charge, which is a point persistently ignored by the Anti-Railway School of Economics. Furthermore, the net results of railway operations for more recent months are so much more unfavorable than those presented by Mr. Thompson for the calendar year, that it is little to be wondered at that the railway situation of to-day is considered by those who are able to fully comprehend it, as little short of desperate.

In discussing the attitude of the Interstate Commerce Commission towards the railways with special reference to the advance rate case, Mr. Thompson has the following to say:

"Three years have elapsed since Chairman Prouty and Commissioner Lane rendered their decisions denying the application of the eastern and western railways for advances in freight rates, and all the fears of the railways have been more than realized. The fitful promise of better times that deceived the Commission, then, settled into a three years' struggle to make unremunerative rates meet the advancing cost of living, the advancing demands of labor for higher wages, the legislative prescription of full crews and shorter hours, and the public clamor for more expensive service. The story is an old one now. Successive arbitrations have forced on the railways higher wage scales while the arbitrators have been powerless to adjust the income of the railways to pay the increased scale. This adjustment was passed on to the Interstate Commerce Commission. Many railway employes were given a minimum scale nearly equal to their average pay but to this day no minimum rate has been fixed or found below which the average receipts of railways may not be forced. There is no apparent minimum to protect them from confiscation or receiverships.

"For three years the needs and necessities of the railways have been common knowledge. To every boast of a high tide in earnings there has been a constant undertow of increased expenses for everything entering into railway operation. Only once since 1907 has the ratio of expenses to earnings been below 70 per cent, which, except as affected by the money market, is the dead line for the railways of the United States as a system. For the six fiscal years since 1907 this tell-tale has ranged 73.20; 69.86; 70.06; 72.54; 73.54; and 73.55. The high mark for 1908 was due to a drop of nearly $200,000,000 in revenues and the low record of 1909 marked the drastic retrenchments in deferred expenditures, which the railways have not yet overtaken.

"For the calendar year 1913 this ratio was 75.58 per cent, and for the month of January, 1914, it was 82.2 per cent, in which month, for the railways of the eastern district a petty five per cent advance in rates, it was 87.6 per cent.

"Verily it is a condition and not a theory upon which every other industry in the country waits. Prosperity strains at the leash which the Commission holds in its all-powerful hands, hesitating to unloose its hold.

"Now why does the Commission hesitate and procrastinate? Why does it summon Mr. Louis D. Brandeis to its council? Why permit Mr. Clifford Thorne to unload tomes of irrelevant statistics upon its tables? Why invite shippers to file selfish protests against the performance of an obvious duty, the benefits of which would accrue to them as well as the whole country?

"These questions are difficult to answer. The employment of Mr. Brandeis is explicable. His national fame rests on his exploded statement that by the practice of efficiency, which came trippingly from his tongue, the railways could save a million dollars a day. By turning to the center pages of this pamphlet the reader will perceive that this stroke of efficiency legerdemain would wipe out every cent of the expenditures for maintenance of equipment in 1909! In no other division of railway operations is the Brandeis brand of efficiency applicable. It has to be applied to men in the mass and not individually.

"Then why has Mr. Brandeis, who had been retained by interests hostile to the railways in the former hearing, retained by the Commission in this? In times past a lawyer with a keen sense of professional propriety would not have accepted such a retainer. But we live in progressive times. Mr. Brandeis has apparently tried to justify his retainer by propounding a series of 78 questions which have cost the railways thousands of dollars to answer, and which are not pertinent to this investigation when answered. The compilation and analysis of the answers alone would delay a decision six months. He represents the spirit of prosecution which should have no place in such a hearing. Through his retainer the inquiry assumed the appearance of a search for an excuse to deny the advance rather than an open-minded inquiry into the necessity for granting it.

"But the injection of Mr. Clifford Thorne into this hearing is wholly inexplicable. Mr. Thorne was elected a railroad commissioner of Iowa while holding briefs hostile to the railroads. Even in the present hearing, while he poses in the public prints as the Railroad Commissioner from Iowa, he is registered in the 'Traffic World' as 'representing the American Live Stock Association' and leading the general attack on any advance. Aside from this seeming impropriety, Mr. Thorne's value as an expositor of railway finances rests upon his undervaluation of American railways roughly valued by Mr. Prouty at $20,000,000,000 by six billions of dollars, his estimate that the United States could purchase them for $14,000,000,000 in three per cent bonds, and his error of $211,306,540 in stating what the government could save annually by taking over the railways.

"In addition to representing several state railroad commissions and the Live Stock Association, Mr. Thorne claimed to represent the shippers and consumers of the West. For twenty years so-called representatives of the shippers, masquerading as consumers, have been camping in the vicinity of the Interstate Commerce Commission proclaiming their hardships under the lowest freight rates on earth. During those twenty years the average freight receipts of the railways have been hammered down from 8.78 mills to 7.27 mills per ton mile. And during that time the enormous sum of $4,211,341,820 has been remitted in freight charges to the shippers, not one red copper of which has reached the consumers. Every cent of this vast sum has stuck in the pockets of the shippers, who, through their consignees, have meantime increased the price of all commodities 33 per cent to the consumers. These are no fancy figures selected to make a point. The reader can verify them in the reports of the Commission and the Bulletins of the Bureau of Labor, or he can find them in their proper place in this report.

"Is it not time the Commission closed its ears to the representatives of associations that have exacted such tribute from both carriers and consumers?

"It is to be hoped that the Commission will not seek to postpone a definite settlement of this question by prescribing such palliatives as a shift in terminal charges or the recommendation of some nebulous system of efficiency for the most efficiently operated railways in the world. It might help, however, by recommending that the government pay at least the cost of transporting the mails, including postal packages which are now carried at an annual loss of from $25,000,000 to $30,000,000.

"In regard to the maintenance accounts, about which there has been some criticism, the briefest analysis discloses that the high ratios for 1913 were necessary to make up the replacements deferred from the lean years 1908 and 1909. What will be the effect of Chairman Harlan's suggestion that maintenance accounts should include a minimum charge of three per cent for depreciation is an open question. The returns for 1913 indicate that four per cent would be nearer the actual depreciation. The average life of all equipment is approximately 25 years and during the last years of that life much of its time is spent in repair shops. Had the depreciaton charge of three per cent been obligatory in 1913 the cost of maintenance of equipment for that year would have been at least $50,000,000 more than it was.

What Is at Stake in the Eastern Rate Case?

"It is not an advance of five per cent in the rates for Eastern railways alone that is involved in the present hearing, but the Commission's conception of its duty and attitude toward the carrying industry of the United States. Is regulation to mean nothing more than inquisition, restriction and rate reductions, or corrective, constructive and progressive state guardianship of the great transportation industry? The grant of the full advance in itself would amount to a mere drop in the sea of advancing costs that surges about the railways. But its moral effect would spread to the remotest shores of American industrial life.

"Clearly this is a queston not to be settled while listening to the conflicting testimony of interested witnesses in Washington under the harrying of keen-witted lawyers, but behind closed doors in the private sessions of the Commission. It involves the most difficult decision patriotic men are occasionally called on to make —the decision to reverse themselves, to retrace a long line of precedents all leading further and further away from the principle laid down by the Commission's first Chairman that 'the act to regulate commerce was not passed to injure any interests, but to conserve and protect. It had for its object to regulate a vast business according to the requirements of justice.'

"But such a change of policy comes not about through taking counsel with experts and lawyers but 'by fasting and prayer.' In this case the railways are doing the fasting and American industries are doing the praying. Unless the relief is given broadly, ungrudgingly and through motives of the highest state policy, an advance of five per cent will not save the situation.

"Out of the present situation has come the timely declaration of President Samuel Rea, of the Pennsylvania Railroad that the railways will abandon their laisser faire attitude when attacked and will use every legitimate means in the assertion of their rights. 'Your management,' said President Rea, addressing the 89,000 stockholders of the Pennsylvania, 'is determined that, within the limits of reason, it will hereafter allow no statement to go unchallenged that reflects on the management or the integrity of its officers.' It is to be hoped that Mr. Rea's example will put heart into other representatives of the railways that they may stand up in any presence and with clean hands and level eyes demand just treatment because they render efficient service for equal and reasonable compensation.

Rate Reductions During 1913.

"While the chief attention of students of the railway problem has been fixed on the application for an advance in rates on eastern roads the wheels of regulation have been grinding out their annual tale of rate reductions. The net result of these reductions as set forth in subsequent pages of this report is summed up in the figures 7.27 mills as the average receipts per ton mile in 1913 against 7.43 mills in 1912 and 7.57 mills in 1911. The hand the respective Commissioners have had in bringing this about is shown in the following distribution of their opinions into dismissals of complaints and reductions or reparations:

Opinions by	Dismissing Complaints	Granting Reductions or Reparations
Chairman Clark	6	10
Commissioner Prouty	9	11
Commissioner Clements	17	11
Commissioner Lane	0	3
Commissioner Marble	3	3
Commissioner Harlan	4	12
Commissioner Meyer	8	19
Commissioner McChord	3	11
The Commission	68	78
Total	118	158
Percentage	42.8	57.2

"This brings the record for the past five years, since the Bureau began analyzing it, down to date as follows:

Number of Decisions.

Year	Dismissing Complaints	Per Cent	Reparations or Reductions	Per Cent
1909	138	39.7	219	61.3
1910	138	41.1	198	58.9
1911	93	37.4	156	62.6
1912	132	35.2	243	64.8
1913	118	42.8	158	57.2
Total	619	38.8	974	61.2

"Coincident with the 158 reported opinions reducing rates, etc., mentioned above the Commission entered no less than 3,211 "Informal Reparation Orders' including 100 'Unreported Opinions,' all tending to reduce the net revenue of the railways. In the meantime it entered 64 opinions suspending tariffs and 46 vacating suspensions on the Investigation and Suspension Docket. It also rejected 589 freight tariffs and 224 passenger tariffs without filing opinions.

"While these figures do not begin to exhaust the Commission's activities they fairly represent the general trend of its opinions and decisions."

Some Plain Facts Regarding the Railway Situation

Address of Ivy L. Lee, Executive Assistant, Pennsylvania R. R. Co., Before Wilmington, Del., Chamber of Commerce, April 14, 1914.

I WONDER whether you would have invited me to appear on this occasion had you known of a speech which was made in Congress yesterday by Senator Cummins. Senator Cummins is reported in the newspapers of to-day as having, among others, made these remarks with reference to the five per cent freight rate increase:

> "In connection with the proceeding before the commission there is in progress the most comprehensive, energetic and persistent campaign I have ever witnessed to make the people of the country believe that the effort of the Government to regulate railroads, railway rates and railway practices has resulted in dismal, disastrous failure.
>
> "The railroads are trying to mislead and pervert the judgment of the people. They are trying to awaken sympathy by false pretenses. They are trying to deceive the country with exaggerated cries of suffering and distress.
>
> "This extraordinary campaign has filled the newspapers with headlines, with dispatches. It gives dinners and holds public banquets where the eloquence of orators paints lurid pictures of empty treasuries, of worn-out tracks, of falling bridges and dilapidated equipment."

This luncheon would seem, therefore, to be one of those occasions where we have already been convicted of trying to deceive the people and ourselves as well, and to awaken sympathy by false pretenses.

To be quite frank, it hardly seems fair that a speech of that kind should be made in Congress. We are accused of having conducted a nefarious campaign to mislead the public and to prejudge the case now before the Interstate Commerce Commission. And yet, a Senator of the United States comes out upon the floor of the Senate and proclaims that the case we are trying to make out is absolutely without warrant. I don't condemn Senator Cummins for his speech. It seems to me that from his point of view it is quite a proper speech to make, assuming that we also have the right to reply. But to accuse the railroads of trying to mislead the public hardly seems fair when an effort is being made to prejudge the case in the United States Senate.

Now since Senator Cummins has made this speech, I would like to tell you precisely what the railroads have done in this freight rate campaign. I happen to have personal knowledge of what I speak. We are accused in this speech of having inspired newspaper headlines, and I know that there are a large number of people in Washington who believe the attitude of the press in this matter has been stimulated by subterranean methods hardly worthy of public approval.

Now I know what has been done. Before this case was presented to the Interstate Commerce Commission, we came to the conclusion that the methods used in 1910 were unfortunate in that we had not taken our case to the people as well as to the Commission. We therefore asked our officers to go here and there before Chambers of Commerce, Boards of Trade, business organizations and so forth and present to them the case we expected to present to the Interstate Commerce Commission. Before the hearings were held in the presence of the Commission some of our representatives went to the Commission itself and said in substance:

> "We don't intend to rely upon the casual newspaper reports for the people of this country to learn the reasons which we shall present to you and upon which we ask for this increase in rates.
>
> "We are going further than that. We propose after each hearing to make a short, succinct extract of every important fact which we present to you under oath. We intend to send such a resume to every important newspaper in the United States, we intend to send it to the mayors of cities, to the secretaries of chambers of commerce in the various cities, to members of every State legislature, to every State Railroad Commission, to postmasters in the principal cities, to college libraries, city libraries, and professors of economics in colleges. We intend that the people interested shall be fully informed as to every salient fact which we present to you. This, not to appeal from the Commission to the people, but to let the people know our position."

We asked the Commission, before that plan was undertaken, if they had any objections to make. We received a letter which is on file, a letter stating that the Commission had no comments to make thereon. From this letter we had the right to assume that the Commission had no criticism to make on this scheme, assuming, of course, it was carried out in good faith.

We have followed this plan carefully; we have tried to bring to public attention every pertinent fact which we have presented to the Interstate Commerce Commission. We have tried to make that campaign as intelligent, as comprehensive, as energetic, as it could have been made. We have restricted reference absolutely to matters of record. In order that everything should be open and above board, we have sent to the Commission several copies of every one of our publications. That is the entire extent of our newspaper campaign. If that is not a fair way to go to the people with a proposition, what is the meaning of the word "fair"?

The campaign has been successful to a very large extent. The people are with us, and public sentiment in this country to-day appears to be largely in favor of the advance in freight rates. But it is inconceivable to a large number of people that this sentiment should have been developed by perfectly straightforward methods. We have been chided in the past for not having taken people into our confidence. When we take the people into our confidence, take them into our confidence with such palpable sincerity and completeness that we gain in return the confidence and support of the people, some of our friends in Washington think the Devil has surely been at work somewhere although they are unable to discover the exact method.

The railroads have been accused—they were accused yesterday—on the floor of the Senate of the United States of having discharged a large number of employes for the purpose of affecting the decision of the Interstate Commerce Commission in this case. Now, gentlemen, that is a very serious charge. Our company, it is true, has discharged or furloughed about 38,000 men since the first of last October. But is it conceivable that a company like ours—and you must pardon me if I refer more or less to the Pennsylvania Railroad, because it is with that railroad I am employed and therefore most familiar—is it conceivable that a company like ours, with its record of harmonious relations with its employes, with a knowledge that so many of its employes must have of its actual condition, is it conceivable that we would play fast and loose with the daily bread of 40,000 employes for the sake of affecting the decision of any tribunal?

If that were conceivable, consider this fact: Business began to fall off with us very decidedly about the first of October. We were at that time employing on the Lines East of Pittsburgh about 142,000 men. This drop in business conditions continued through November and December with an accelerating pace.

Our officers had been instructed all over the system to economize wherever possible, to cut things down as near to bed-rock as they could. A good many men were laid off and a good many more were put on short time. We came up then to the month of February, hoping continually that business would improve and that drastic cuts either in personnel or in the service would be rendered unnecessary.

We had up to that time resisted what seemed to be the common sense of the proposition and kept on a very much larger number of men than business required. But what was the result in the month of February of hoping against hope and trying to fight off what we all regarded as only a device of last resort? This was the situation when the February figures came in, in the middle of March. We found that our business for the month of February this year was $2,000,000 less than in the month of February last year. These figures are gross. In February of 1914, we found that we had earned almost exactly what we did in February in 1910, that is $15,000,000 gross on the Lines East of Pittsburgh. Yet we found that during the month of February, 1910, we earned net revenue of $3,000,000 out of that $15,000,000 gross. In 1914, we earned the same amount of gross, namely, $15,000,000 but only $1,200,000 net, a loss of $1,800,000 in net. We found that this same gross business in 1914 of $15,000,000 was done with about 13,000 more men than we had in February, 1910.

With such a serious depletion of revenue, such a tremendous cut in net, a failure in that particular month even to earn the dividend on the Pennsylvania stock, it was obviously necessary to make a drastic cut in expenses. The way it was reasoned out was that the same number of men ought to be able in 1914 to handle the same amount of business that the same number of men did in 1910, especially as during the interval practically all of these men had had from five to ten per cent increases in wages.

That was a situation which could not be trifled with; these were figures that were plain to everyone; it is perfectly certain that if these figures had not been plain to everyone, we would not have been permitted to discharge all of these men without facing a Congressional investigation. What would have been even worse would have been any thought of such a painful policy except under conditions of peremptory necessity.

To accuse the railroads, the Pennsylvania Railroad along with others, of trifling with matters of that kind seems to betray a state of mind on the part of some people in Congress, and some people, serious minded throughout the country, which is at bottom the most serious phase of the whole railroad situation.

In discussing the state of affairs which prevails with the railroads to-day, let us first clear the ground of underbrush. In the first place, I think we can all agree to this, that you can't take any more money out of a railroad treasury than is already there. The railroad treasury is not an inexhaustible reservoir of money.

In the second place, I hope we can further agree that it is quite as important to the people to have good railroad service as it is to the railroads to be able to render good service and pay good dividends. I am sure I don't need to take up that point.

In the third place, let us agree, and I think we can without much trouble, that the proposition to increase freight rates has not been brought about by the present depression of business. Last May, when we were doing a very large gross business, we presented this position for increased freight rates. We felt then that conditions had already promised to describe a curve of trouble for the railroads and subsequent events have proven that our prediction was correct.

This is the fact that the railroads east of the Mississippi River were faced with at the end of June, last year. They found that for the three preceding years they had invested in their properties $660,000,000 in new money accounted for under the new accounting regulations of the Interstate Commerce Commission. During that time their gross business had increased by $186,000,000. Their expenses, however, during the same time, a period of three years, before this era of depression had set in, their expenses increased more than $203,000,000. So that at the end of the three years the railroads in this territory were $17,000,000 worse off in net revenue than they were in 1910, before the $660,000,000 had been spent.

No money spent into a railroad is money spent for keeps. You cannot take it out. You must, therefore, realize that when confronted with results such as I have mentioned, and railroad men sought new money for additional improvements and facilities, investors must have shared somewhat the feelings of the young woman whose bashful lover was very much distressed as to how to propose. So he finally hit upon a plan, after a great many had passed through his mind. He took the young lady, on a bright, moonlight night to the village churchyard. They came in sight of the graveyard and then the young fellow said to his lady friend: "My family are all buried there; wouldn't you like to be buried there too?"

Let us further agree that there is no need to defend past bad practices of any railroads. It is impossible. We cannot ask for 100 per cent purity in the railroad business any more than in any other business. But this I do know, and I think you know, also, that the railroad systems of the United States do their business for cheaper freight rates; they pay their labor higher wages; they pay more taxes in percentage to the amount invested, than in any other country in the world. That would seem to argue efficiency.

We also know that no other business in the country has ever been given the castigation and thorough cleaning out which the railroad business has undergone in the past ten years. I believe to-day that the railroad managers of this country are performing their duty to the public and to their shareholders in a manner that is equal if not superior to the performance in any other business in the United States.

We cannot have 100 per cent purity. There will always be things done which ought not to be done. But we have got to face a real condition: How can we, taking matters as they are, taking men as they are, how can we get the best practical result with the best means which are available? That is the railroad problem.

Whatever may be your views as to a good many of the railroads, I think you will probably all agree that the Pennsylvania Railroad has been fairly well and honestly managed throughout the period of its existence. If the Pennsylvania Railroad is in great need of additional revenue, is it not fair to assume other railroads, possibly not so well managed, are in the same if not a much worse predicament?

What is the position of the Pennsylvania Railroad? During the last fifteen years, since 1898, freight rates in this country have been placed on a stable basis, rebates have been eliminated, we have had some increases in commodity rates, and we have had the benefit of an enormous expenditure of new capital for the improvement of the property, thus bringing greater efficiency and a greater convenience to the public.

In the light of all this, consider the following: At the beginning of 1898, we were just emerging from a most disastrous period of railroad history. And during the time that has elapsed we have had the benefit of all of these developments. With what result? Our property investment—and our property investment means money spent on the property, because we have had a continuous accounting from the beginning up to the present day; there is no water in it,—our property investment on the Pennsylvania Railroad in 1898 was $797,000,000; in 1913 it was $1,398,000,000, an increase of about 47 per cent. During that time our operating revenues increased from $145,000,000 to $382,000,000, an increase of 163 per cent. Property investment increased 45 per cent; gross revenue increased 163 per cent.

Now from that it would appear that we ought to have been able to make a very large increase in net revenue, and that our position to-day ought to be much more satisfactory than it was in 1898. What are the facts? The facts are that in 1898 on this property investment we earned 5.45 per cent and in 1913 we earned 5.48 per cent on the property investment, in net revenue.

In other words, after partaking of the benefits of stable rates, the abolition of passes, the great improvements in trade practices, some increases in commodity rates, and the great expenditure on facilities, we were able only to earn in 1913, .03 per cent more than we did in 1898, and the return in 1913 was the lowest in any year with the exception of 1899, in that ten-year period. That, to say the least, is dangerous, unless checked.

The Pennsylvania Railroad dividend is not threatened. It can continue to operate for some time without an increase in freight rates. But if this company is to continue to expand, to give the increased service which the increased business of the country demands, some further attraction must be provided for the new money with which to provide these new facilities.

Now, why is it that all of this has happened? Why is it that we have been unable to get a greater amount of net revenue from the very large increase in gross business.

In the first place, we pay our labor to-day 37 per cent more than we did ten years ago. Our company paid out almost $200,000,000 in wages last year. If our employes had in 1913 worked on the basis of pay of 1902, we would have paid out last year instead of $200,000,000, the sum of $125,000,000. There is $75,000,000 accounted for right away.

Taxes are going up at an astonishing pace. Railroads pay 19 per cent of all taxes paid in Pennsylvania and 46 per cent of all taxes in the State of New Jersey, and the ratio is constantly increasing.

But the railroads are subjected to a vast amount of regulatory measures by State Legislatures. And right here let me interject the remark, gentlemen, that we are not protesting against regulation. Enlightened railroad managers believe that regulation by commission is a good thing provided the regulation is prompt, impartial and actuated by regard for the general public interest. But it is a very different matter to be subject to arbitrary measures by State Legislatures, passed very often at the behest of labor unions.

Now let us cite two or three instances of what we have in mind. Extra crew laws, adding unnecessary men to trains are costing our system alone $1,100,000 per annum. That is the interest at five per cent on $22,000,000 of capital. We are paying out because of semi-monthly pay laws—which are wholly unnecessary, and only in the interest of improvident employes—we are paying out because of these laws about $400,000 per annum, and this at five per cent is the interest on $8,000,000. We are paying out because of Federal hours of service law—a law which I won't take the time now to explain, but which I ask you to take my word for, in the opinion of competent railroad men, does not accomplish material good—we are paying out $800,000 a year on that account.

These three items capitalized at five per cent represent the interest on $46,000,000 of capital. In other words, if we had spent $46,000,000 of capital on which we had to pay an annual interest of five per cent and if we did not earn one cent of net revenue on the expediture, but had applied it to give some additional service to the public, we would be far better off than we are now, without increased efficiency or safety.

Gentlemen, we are in the regulation of railroads in this country in the condition that the practice of medicine was about one hundred years ago. You remember that when a doctor of medicine was called in in those days about the first thing he would think of doing to any patient was to bleed him. The thought was that if he let out a little blood, he might at the same time let out some of the impurities and perhaps the patient would be better off for that experience. Nowadays we know that the patient must be strengthened.

I was very much interested the other day in reading the diary of George Washington's private secretary describing the last day on earth of the first President of our country. This was published in "McClure's Magazine" in 1898, and has, I believe, every evidence of authenticity:

"December 14, 1799.

"Between two and three o'clock, Saturday morning, he awoke Mrs. Washington and told her that he was

very unwell and had an ague. She observed that he could scarcely speak and breathed with difficulty.

"I despatched a servant instantly for Rawlin (a professional bleeder). Rawlins came in soon after sunrise and prepared to bleed him.

"Dr. Craik came in soon after and upon examining the General, put a blister of cantharides on the throat and took some more blood from him.

"About 11 o'clock Dr. Craik requested that Dr. Dick be sent for as he feared Dr. Brown might not come in time. About this time the General was bled again.

"Dr. Dick came in about 3 o'clock, and Dr. Brown arrived soon after. Upon Dr. Dick's seeing the General and consulting a few minutes with Dr. Craik, he was bled again.

"That evening between ten and eleven, he expired without a struggle or a sigh."

May railroad bleeding stop before it is too late!

Now, gentlemen, I am not going to take any more of your time. I ask you to view this case from this point of view: That the railroad can continue to give their present services without increased rates—at least the Pennsylvania Railroad can—paying the present rates of wages, without further improvements in the service and without increased service; but if the railroads of this country are to expand, if they are to grow with the people and with trade, if they are to be able to give that increased standard of service which the public demands and rightfully should demand, the railroads must be permitted to earn a return upon the additional money with which to provide the new facilities. That is a plain business proposition.

I am not here to attempt to prejudge the case before the Interstate Commerce Commission. We have presented our case and we are prepared to abide by the judgment of that tribunal. Railroad managers feel that they need additional revenue. But more than that, they need the confidence of the public.

The railroads cannot thrive, they cannot live, unless they have in their day-to-day affairs the confidence of the public with whom they deal.

When all is said and done, the greatest necessity of the whole railroad situation is to restore the confidence of the people in the good faith and earnestness of honest men. When that is accomplished, we will make real progress.

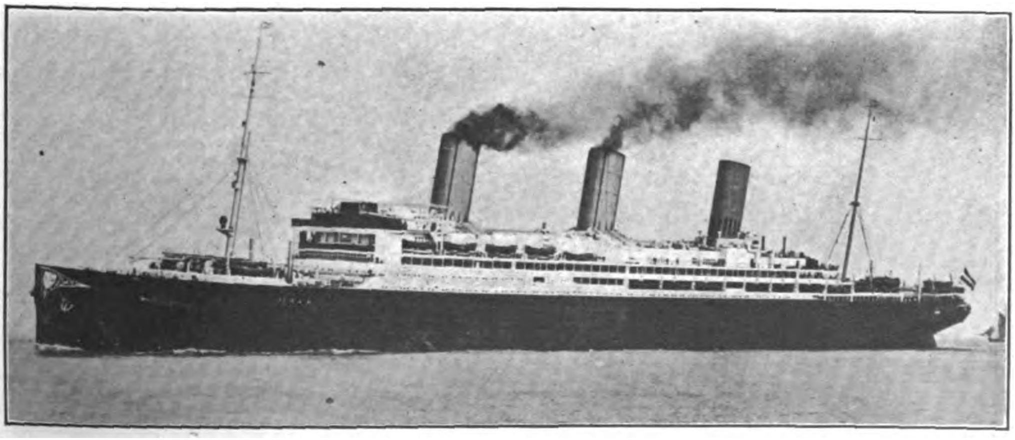
The World's Largest Ship

THE new steamship Vaterland of the Hamburg-American Line, recently completed on the other side of the Atlantic, has the distinction of being the largest ship in the world. While closely resembling her famous sister ship, the Imperator, the new queen of the seas exceeds her in all dimensions. The Vaterland measures 950 feet, or nearly five city blocks in length, 100 feet in width, and has a tonnage of 58,000. The leading decorators of Europe have been engaged to design and furnish her sumptuous cabins, each of which is a masterpiece in its decorative style. The Vaterland sailed from Hamburg on her maiden trip May 14th, arriving in New York on May 21st.

Every conceivable precaution has been taken in the construction and equipment of the Vaterland to assure complete safety. As in the case of the Imperator her hull has been constructed with a complete inner skin carried high above the water line, making her a ship within a ship. She is provided with both longitudinal and transverse bulkheads giving her a cellular construction, rendering her proof against collisions and similar accidents. She carries life boats more than sufficient to accommodate all on board. Her powerful wireless apparatus enables her to keep continuously in touch with land. A unique feature is a complete fire department recruited from the fire departments of German cities. The efficiency of her equipment is assured by frequent drills and rigid discipline.

The Vaterland has many original features. She is the first steamer ever built with funnels which do not pass directly through the centres of the decks. Each of her three great funnels divides in the form of the letter "Y" at a point beneath the lowest passenger deck, and join again in a single tube which rises above her uppermost deck. The space occupied by the ordinary funnels passing through the middle of the decks is thus left clear, and the public cabins may thus occupy the deck without obstruction.

Taking advantage of this new arrangement of the funnels the grand dining room of the Vaterland will be unique. It will accommodate 800 pas-



THE HAMBURG AMERICAN LINE'S NEW STEAMSHIP VATERLAND, THE WORLD'S LARGEST SHIP.

THE WINTER GARDEN ON THE STEAMSHIP VATERLAND.

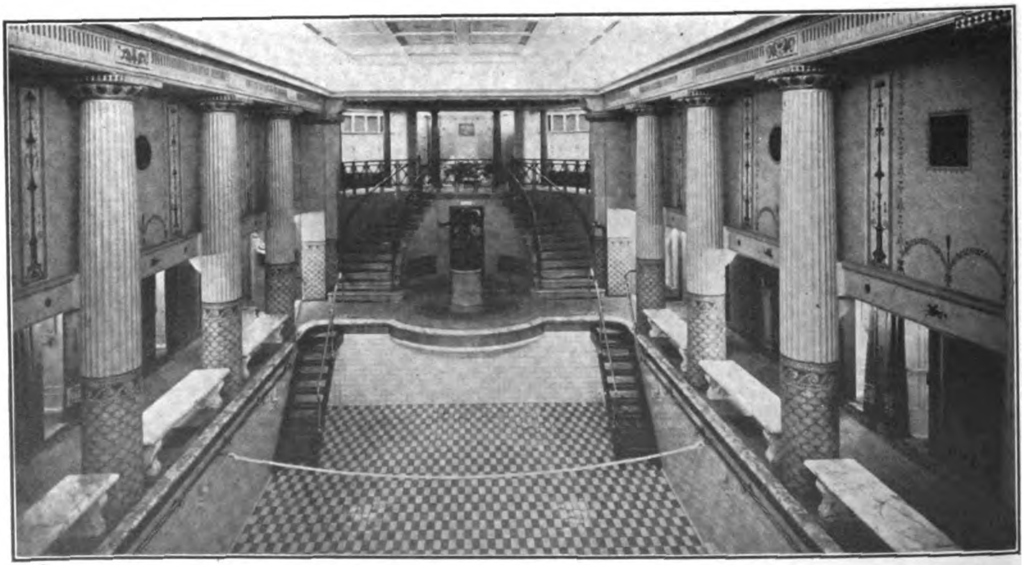
sengers at one time, all seated upon the same deck. The great size and steadiness of the steamer make it possible to furnish the dining room with movable dining room chairs, in place of the swivel seats firmly attached to the floors, common to ocean steamers. In addition to the regular dining room, the Vaterland will have an elaborate Ritz-Carlton restaurant, a grill room, and a palm garden. The main dining room of the Ritz is built oval in form, exactly reproducing its counterpart in New York City.

The great social hall of the Vaterland is even larger than the famous ball room of the Imperator which has attracted worldwide attention. This sumptuous public cabin will be the largest ever constructed on shipboard. It is roofed with glass, uninterrupted by pillars or support of any kind, and illuminated by concealed lights. The woodwork throughout is richly carved, the walls are panelled with rare tapestries and set with statues. A unique feature of the social hall is a theatrical stage.

The elaborate swimming pool of the Vaterland and her various electric therapeutic, and other baths lend her the attraction of a great spa or bathing resort. The pool which reproduces a Roman bath extends through three decks. It consists of three large rooms, an entrance hall, with hand painted walls and a floor of ornamental mosaics, an antichamber roofed with glass, and the pool. The roof of the pool is supported by ten marble pillars, and arranged along the sides are twenty-eight bath cabins. In these rooms will be found electric light baths, water cures, carbonic acid baths, needle baths, massage rooms, a barber shop, hair dressing parlor, etc. The pool is constantly refilled and kept at a uniform temperature.

The smoking room of the Vaterland is one of the largest and most luxurious cabins ever devoted to the purpose. It has been placed on an upper deck forward, occupying the space usually taken by the officers' quarters, and extends the width of the ship. The smoking room is, therefore, open on three sides, thus assuring perfect ventilation and excellent light. The cabin has been sumptuously decorated with a wealth of rich panelling and carving. A deep fireplace and several recessed seats and cosey corners lend a homelike appearance to the great room. Opening directly from the smoking room are two writing rooms for gentlemen.

The great size of the Vaterland has made it possible to make her staterooms unusually commodious. The Vaterland is the first ship to be



THE ROMAN BATH ON THE STEAMSHIP VATERLAND.

built with three passageways running lengthways, which serve to supply every stateroom with abundant light and fresh air, and give the ship an effect of roominess throughout. In every stateroom artistic bedsteads replace the built in beds or berths, common to most ships. Each room is besides supplied with a marble washstand and with both running hot and cold water. Special attention has been paid to the mirrors of the staterooms, and the arrangement of lights and the closet space.

The passengers on the Vaterland have the choice of a great variety of private suites which assure the privacy of one's own home throughout the crossing. These suites vary in size from two to twelve rooms. They are furnished in a variety of decorative styles and color schemes to satisfy every taste. The most elaborate of these suites known as the Imperial Suites, include bedrooms, sitting room, breakfast room, two baths, servants' rooms and a private deck. A large proportion of the staterooms have private bath rooms and the other baths are so distributed as to be convenient to every stateroom. In the first cabin alone there are more than 250 baths.

One of the most important innovations in the equipment of the Vaterland and Imperator is the fire department, composed of experienced fire fighters recruited from the fire departments of German cities. A large cabin centrally located has been set aside as the fire headquarters, and here are located the various signalling devices and indicators, running to all parts of the ship. The special equipment includes, a chemical fire engine, smoke helmets, and other fire apparatus. The firemen patrol the ship day and night and are constantly on duty at their headquarters. A complete system of automatic sprinklers has been installed both on the Vaterland and Imperator.

An important innovation has been made in the steerage accommodations both on the Vaterland and Imperator. The steerage passengers will occupy separate rooms, for two, four or six persons, instead of the dormitories formerly used. They have besides the use of private bath rooms and a laundry. The cabins occupied by immigrants on these great ships assure greater comfort than did the first cabins of steamers a generation ago. The stewards waiting on the tables in the sterage will besides speak all the languages of all the nationalities represented by these cosmopolitan passengers.

Tehuantepec and Panama Trans-Isthmian Rail Traffic During 1913.—Two small isthmian railways—the Panama Railway, forty miles in length and the Tehuantepec Railway, 190 miles long—carried in 1913, $130,500,000 worth of merchandise, brought to their termini by vessels from the United States to be reloaded at the opposite termini and shipped to other ports of the United States and to foreign countries. This is double the amount thus transported in 1908, one year after the opening of the Tehuantepec Line.

The value of American products carried across the isthmuses in this circuitous intercoastal traffic was, via Panama, $31,000,000 and via Tehuantepec, $99,500,000. Two-thirds of this trade, according to the latest compilations of the Bureau of Foreign and Domestic Commerce, Department of Commerce, moved westward, $23,700,000 worth via Panama and $62,400,000 via Tehuantepec, while the remainder moved eastward, $7,300,000 across the Panama Line and $37,100,000 worth over the more northerly transisthmian line.

Only a few American ports participate in this transisthmian traffic. Of the westward movement $84,000,000 worth of merchandise was shipped from New York, $2,200,000 worth from New Orleans, and but $2,500 worth from Boston. The east bound traffic included $21,800,000 worth from San Francisco, $18,200,000 from Hawaii, $2,100,000 worth from ports in the State of Washington, $1,800,000 from ports in Southern California and about $400,000 worth from the State of Oregon.

Financial

The Outlook as Viewed by Prominent Men and Institutions.

THE combined opinion of various financial and trade authorities, bankers and prominent business men as reported by the daily press, holds little of encouragement so far as the immediate business outlook is concerned. The People's National Bank of Pittsburgh, reports that in the Pittsburgh District there were no encouraging developments last month in connection with its chief industries and that price concessions in steel products, coal and coke, did not induce contracting ahead for probable needs. In the steel trade, the manufacturers' average prices were unprofitable and in some departments current consumption did not take up even the average output. During the first half of the month, mills producing other than railroad supplies, operated about sixty to seventy-five per cent of capacity, but during the latter half of the month even these mills were not making stock in some instances and indications are that May will witness further curtailment, unless a speedy and favorable decision in the railroad freight rate case is reached. The unsettled conditions in Mexico have already stopped extensive oil fields in that country in which Pittsburgh capital is largely interested. Railroad tonnage in the Pittsburgh District suffered a material reduction during April as a consequence of industrial contraction.

"Dun's Review" sees some betterment in certain branches of trade but in others a further moderate recession in activities. Fundamental conditions are sound, however, and the agricultural outlook augurs well for the future, yet hesitancy is general in anticipating forward requirements. Production is being curtailed and mill forces reduced, the policy of the railroads in confining purchases to the lowest possible limits, constituting the chief drawback.

James A. Penton, secretary of the American Pig Iron Association, states that there is a feeling of unrest and distrust throughout the country which is keeping people from spending money except where absolutely necessary. New work is practically at a stand still and industrial corporations will not enlarge until they have assurance or at least hope that the Government will cease its attempts to destroy business instead of aiding it.

Bradstreet's points out that the excellent reports as to crop prospects strikingly contrast with advices of irregularity in trade industry. Manufacturing operations reflect these conditions more strongly than heretofore and it is probable that curtailment in the iron and steel trades has gained additional force.

Nelson, Cook and Company are of the opinion that financial, industrial and commercial affairs are drifting along in rather a hopeless, helpless way, waiting for the determination and settlement of the many important problems now confronting the country. More particularly, a decision of the Interstate Commerce Commission in the railroad rate question, it awaited with anxious solicitude. The opinion prevails that the Commission will grant at least a portion of the increased rates asked for. This as Nelson, Cook and Company points out, will of course, help a little, but in their opinion the full increase of five per cent is not sufficient. The attitude of Congress on trust legislation and the present situation with regard to Mexican affairs are also held partly responsible for the prevailing uncertainty in business conditions.

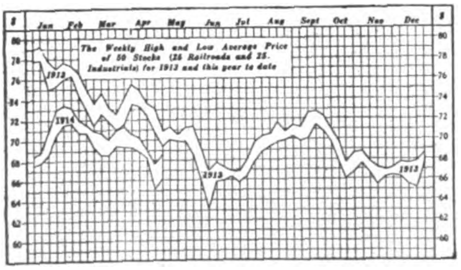
The "Iron Trade Review" reports that the iron and steel trade continues to drag out an uncertain course with no visible signs of general improvement. Mill operations continue to be reduced gradually to meet the reduced volume of business. The pig iron markets are at minimum activity.

The "Iron Age" points to a deficit of more than $6,000,000 in the quarterly statement of the United States Steel Corporation which is practically the amount of the common stock dividend. Corporation profits of $6 to $7 a ton on the shipments of the first quarter mean a dismal showing for steel companies which normally make several dollars a ton less than the corporation. April has been a poorer month than the average of the first three. May and June, if there is an early rate advance, can do better, but otherwise the betterment is not in sight to-day.

The Stock Market.

THE following chart which appeared in a recent issue of the New York "Times Annalist" shows the trend in the prices of leading securities, during 1913 and the first four months of the current year. As indicated, leading stocks are considerably below their average of a year ago, transactions have been extremely light and the trading largely professional.

The Course of the Market



The bond market is also inactive and so far as the railways are concerned, could hardly be worse. No effort is being made at the present time to procure new capital except for the purpose of caring for maturing obligations and even in the event of an increase of rates, certainly not unless the full five per cent is granted can there be expected much immediate activity in the way of new bond issues. The railways have been passing through one of the most severe periods of their history and the lessons received have been sharp enough to cause extreme conservatism to be a controlling factor for some time to come.

Railway Earnings for Fiscal Year.

THE thirty-five railroad systems in Official Classification Territory which are applying for a five per cent increase in freight rates, have compiled and filed with the Interstate Commerce Commission data setting forth results of their operations for the first eight months of the present fiscal year.

During the period from July 1, 1913, to February 28, 1914, the revenues of these companies decreased from $931,508,361 to $910,346,537 as compared with the previous year.

For the same period expenses increased from $645,404,193 to $693,364,514.

There was thus a decrease in revenues of $21,161,824, and an increase in expenses amounting to $37,960,321—or a loss in net operating income of $59,122,145.

When the foregoing fact is added an increase in taxes of $2,507,471 and a decrease in net revenue from outside operations, there is shown a loss in operating income of $69,355,881, or 26 per cent.

Assuming that no additional money has been invested in these properties since July 1st of last year, the returns for the current eight months show 4.47 per cent earned on property investment, as against 5.53 per cent in the corresponding eight months of last year.

The Pennsylvania System in the same period shows 4.92 per cent as against 5.56 per cent in 1913.

The New York Central Lines show 3.56 per cent as against 5.63 per cent in 1913.

The Baltimore & Ohio System shows 4.10 per cent as against 4.63 per cent in 1913.

The Erie System shows 2.75 per cent, as against 3.91 per cent in 1913.

The Pennsylvania Railroad System, Baltimore & Ohio System and New York Central Lines show 4.23 per cent, as against 5.44 per cent in 1913.

The rate of return on property investment that is shown by all these railroads for this portion of the present year is the smallest of any year in the last fifteen years.

New Haven Syndicate Formed.

J. P. MORGAN & CO., the National City Bank, the First National Bank, Kidder, Peabody & Co., and Lee, Higginson & Co. have completed the formation of a syndicate to underwrite the $20,000,000 New Haven one-year five per cent notes; $20,000,000 Harlem River & Port Chester one-year five per cent notes, and $20,000,000 New England Navigation Company three-year six per cent notes purchased by them. The Harlem River & Port Chester notes are indorsed by the New Haven, but the New Haven and New England Navigation notes have various treasury securities as collateral. The $20,000,000 Harlem & Port Chester one-year five per cent notes are a direct obligation on the properties of that company, which have cost $45,000,000. They are preceded by only $15,000,000 of first mortgage bonds, leaving an equity at cost prices of $30,000,000 for the $20,000,000 notes sold, and $7,500,000 junior notes deposited back of New Haven's notes. The full list of the collateral for the other two issues of notes has not been announced.

The underwriting syndicate will, it is understood, offer the $20,000,000 New England Navigation Co. 3-year six per cent notes at 99½, and the $20,000,000 New Haven one-year five per cent notes and the $20,000,000 Harlem River & Port Chester one-year five per cent notes, endorsed by the New Haven, at 99.

The bankers' syndicate purchased the $60,000,000 New Haven and subsidiary notes at 98, netting the New Haven $58,800,000 or $4,800,000 in excess of the $54,000,000 note maturities prior to July 26th.

The New Haven management says that the $4,800,000 will provide cash for all the railroad's addition and betterment necessities and that in these times only necessities can be attended to.

Railway Revenues and Expenses for February.

THE latest figures of the Bureau of Railway Economics at Washington, only serve to emphasize the grave situation which confronts the railways, particularly those in Eastern territory, because of a constantly and rapidly diminishing net revenue. Returns for February reported by this Bureau and reduced to a per mile of line basis for the purpose of comparing them with the returns for February, 1913, show a decrease in total operating revenues per mile of 11 per cent, and a decrease in operating expenses per mile of 3.1 per cent. Net operating revenue per mile was less by $88.00 or 33.8 per cent than for February, 1913, while that for February, 1913, was 2.4 per cent greater than for February, 1912.

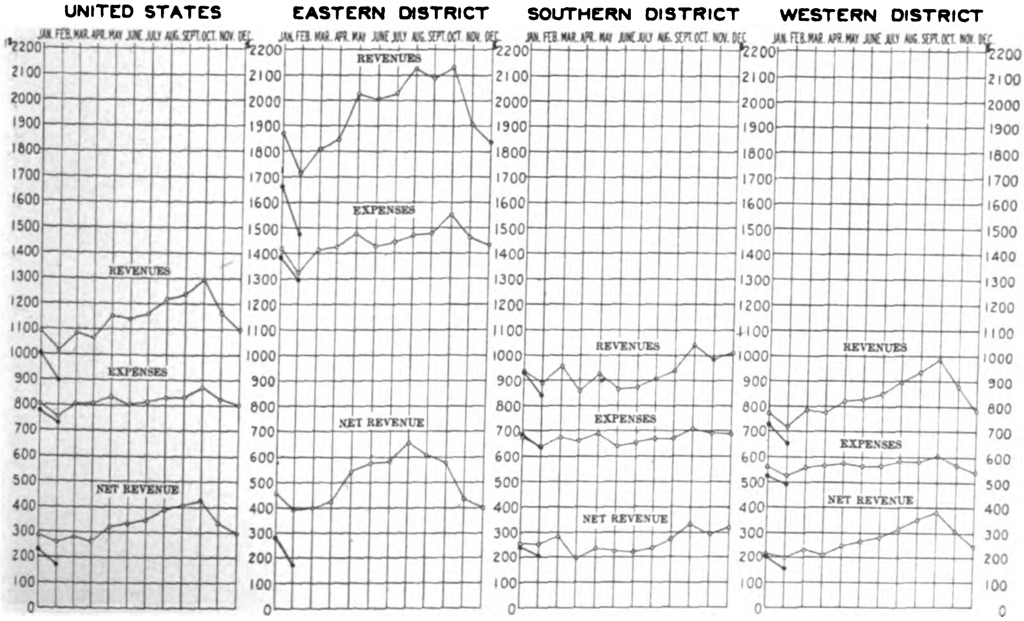
Railways operating 225,539 miles of line are covered by this summary, or about ninety per cent of all steam railway mileage in the United States. Their operating revenues for the month of February, 1914, amounted to $203,022,222. This amount includes revenues from freight and passenger traffic, from carrying mail and express, and from miscellaneous sources connected with rail operation.

Compared with February, 1913, total operating revenues show a decrease of $23,330,211. Total operating revenues per mile of line averaged $900 in February, 1914, and $1,011 in February, 1913, a decrease of $111 or 11.0 per cent. There were decreases of 13.1 per cent in freight revenue per mile and of 5.4 per cent in passenger revenue per mile.

Operating expenses, which include all the costs of maintaining track and equipment, operating trains, securing traffic, and of administration, amounted to $164,379,406. This was $4,031,222 less than for February, 1913. These operating expenses per mile of line averaged $729 in February, 1914, and $752 in February, 1913, a decrease of $23 per mile, or 3.1 per cent.

Net operating revenue, that is, total operating revenues less operating expenses, amounted to $38,642,816, which was $19,298,989 less than for February, 1913. Net operating revenues per mile

RAILWAY REVENUES AND EXPENSES PER MILE OF LINE DURING THE CALENDER YEAR 1913, AND JANUARY AND FEBRUARY OF 1914.



The points on the vertical lines are of significance only in showing the condition for the particular month. The lines connecting the points assist in tracing the change from month to month but do not indicate the trend during the month, nor are they cumulative for the period.

of line averaged $171 in February, 1914, and $259 in February, 1913, a decrease of $88 per mile, or 33.8 per cent.

Taxes for the month of February amounted to $11,276,646, or $50 per mile, an increase of 10.3 per cent, over February, 1913.

Operating income, which is net revenue from rail and auxiliary operations, less taxes, averaged $119 per mile of line, and in February, 1913, $212, thus decreasing $93, or 44.0 per cent. Operating income for each mile of line for each day in February averaged $4.25 and for February, 1913, $7.58. Operating income is that proportion of their operating receipts which remains available to the railways for rentals, interest on bonds, appropriations for betterments, improvements, new construction and for dividends.

The operating ratio for February, that is, the per cent of total operating revenues absorbed in operating expenses, was 81.0 per cent, which is comparable with 74.4 per cent in February, 1913, and 73.7 per cent in February, 1912.

The accompanying diagram shows the monthly revenues and expenses per mile of line of roads having annual operating revenues of $1,000,000 or over. It will be noted that the Eastern roads have felt more severely the decrease in net earnings than have either the South or Western roads.

Railroad Losses from Colorado Coal Strike.

COLORADO & SOUTHERN and Denver & Rio Grande, each operating a heavy proportion of its mileage in Colorado and depending for 35 per cent and 30 per cent of total tonnage, respectively, on bituminous coal, are the carriers which have suffered most severely from the protracted labor disturbance in the Southern Colorado coal fields since last September. Mining of coal in those districts has been at a practical standstill since early last fall. The output of the entire state has been reduced to about half the normal figure.

Continuous losses in gross and net since September resulted in a loss in gross revenues for Colorado & Southern of $1,000,000, or ten per cent, compared with a year ago. This decline in total revenues was carried down through net to final surplus after charges, which amounted to only $515,000 this year against $1,551,000 in the same months of last year.

Denver's gross in the eight months declined $773,000—or 4½ per cent—which was reduced somewhat by economy in transportation expenses but not enough to prevent a loss of 46 per cent in final surplus after charges.

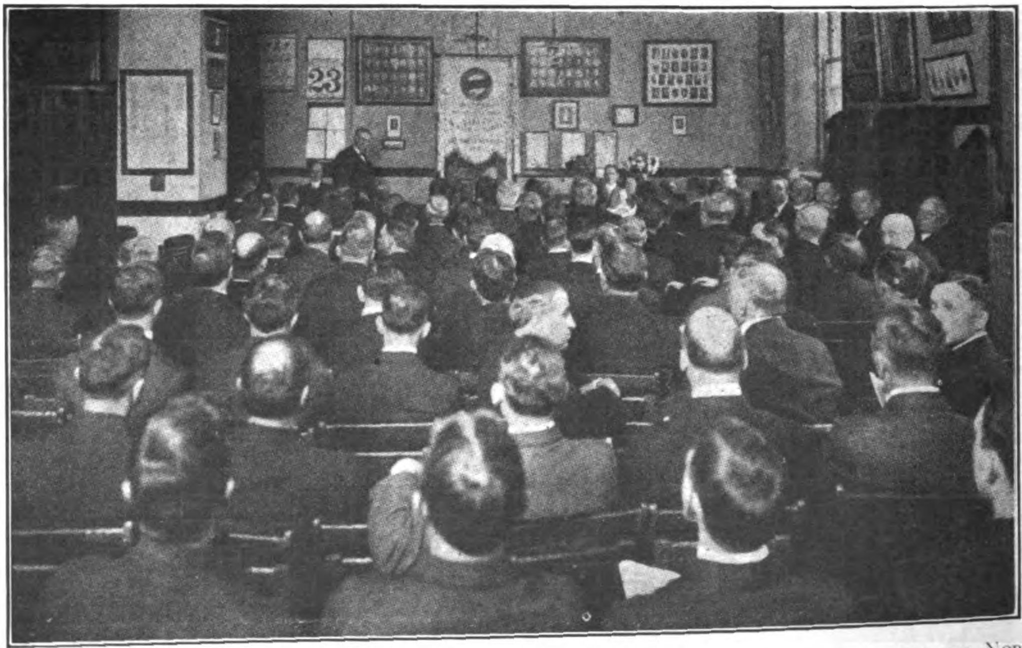
Operation

Chicago and North Western Line Awards Safety Banner.

THE Wisconsin Division of the Chicago and North Western Railroad has been awarded the safety first banner for the highest averages along safety lines of any division of the system during 1913. The Iowa and Minnesota divisions received honorable mention.

In presenting the banner to the successful division, Ralph C. Richards, chairman of the Central Safety Committee, of the Road, spoke as follows:

"One of our great educators has said 'that



Presenting the Safety First Banner to the Wisconsin Division of the Chicago and North Western Railroad.

the world turns aside to let any man pass who knows whither he is going.' And so it is on this railroad of ours; all the men on the other divisions turn aside to let the men on the Wisconsin Division pass because you know whither you are going, and if they ask you, you will tell them that your destination is called 'Conservation, not of property, or rivers, or minerals, or timber, or land, but of those priceless things, your lives and your limbs, that none of you will part with for love or money.'

"You men of the Wisconsin Division have passed two of the milestones in your journey, and each year you are getting nearer to your destination, and so, as an evidence of your achievement during the year 1913, I have been directed by the Central Safety Committee, and it is my great pleasure, for the second time to present to you the banner which each year is awarded by that committee to the division having the best record for safety in work and travel on the safest and best railroad in the country; and at the same time to express to you the thanks of the Committee, of the men and of the management of the Chicago and North Western Ry. Co., for the splendid work you have done for the conservation of human life."

Efficiency Tests on the Pennsylvania.

REPORTS just compiled show that during 1913 exactly 215,279 efficiency tests were made to ascertain the observance of train safety rules on the Pennsylvania Railroad between New York and Philadelphia—the New York Division—and 99.65 per cent showed perfect performance.

One thousand and fifty-seven checks were made of the observance of signals set at "danger," and the result was practically perfect. In two cases trains passed signals by only sixteen or seventeen feet, but they were counted as failures. These were the only trains that failed to come to a stop at a danger signal.

The other tests were of rules concerning "Engineer's Observance of Flagman's Signal," "Flagman's Performance," "Conformity to Speed Regulations," and similar ones.

In summarizing his report for the year, the Superintendent of the New York Division makes this comment:

"I think failures are becoming generally less each month, and I further feel that we are having better co-operation of the men in general in trying to comply with the rules."

Locomotive Speed Recorder Annunciator Being Tested by Baltimore and Ohio.

SAFETY of railroad travel is enhanced by a recorder annunciator invented and patented recently by Charles Edmonds, a mechanic in the shops of the Baltimore and Ohio Railroad, at Baltimore.

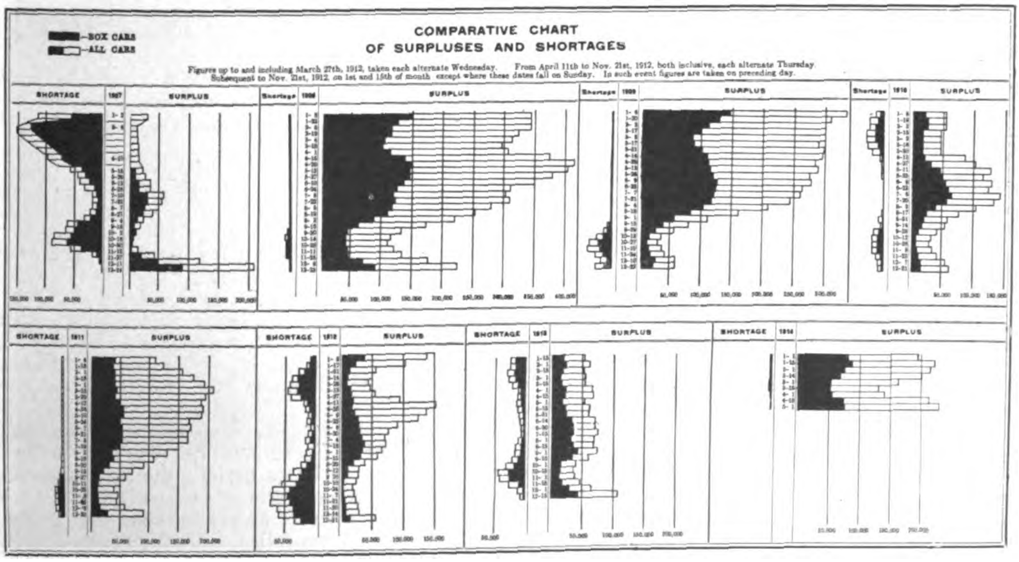
The new appliance consists of a signal system attached to the speed recorder and located in the cab of the locomotive to notify the engineer that the speed limit of safety prescribed by the rules has been reached. The signals are indicated by a gong which rings in the daytime, supplemented by a light which flashes before the engineer by night. Both signals work automatically and continue while the train is running one mile and a half.

The device has been tested on several locomotives in regular service and has been reported upon favorably. The Baltimore and Ohio is considering installing the annunciator on its locomotives in through train service, which, with many of the engines used on local runs, are equipped with speed recorders which indicate the rate of speed and make a record for each mile the train travels.

In adopting this method of train operation, the speed limits were fixed by the officials and by informing the engineers it has been possible to operate the trains with the greatest degree of public safety and comfort.

The Car Situation.

THE American Railway Association has issued its statement of car surpluses and shortages as to May 1, 1914. The total number of idle cars on that date was 230,533, compared with but 53,977 on May 1, 1913. Short-



ages on the same dates were for 1914, 1,654 cars and for 1913, 14,178. It is reported that a small shortage of box cars has developed in the middle west. The accompanying diagram shows the shortages and surpluses for a period of nearly seven and one-half years.

Contributory Negligences in Railway Accidents.

IN order to ascertain to what extent contributory negligence is responsible for accidents at railroad crossings of the public highways, a series of observations was conducted recently by the Baltimore and Ohio System which showed a reckless disregard on part of the public for personal safety and practically complete failure to heed the warning of watchmen, signals or crossing regulations.

A record was kept at several of the busiest crossings on the Baltimore and Ohio Southwestern and the Cincinnati, Hamilton and Dayton lines, and out of a total of 32,079 instances of the railroad tracks being crossed by motor vehicles, teams and pedestrians, only 298 were recorded where the rule of stopping, looking and listening, or stopping to receive a signal from the watchman before proceeding were observed, which shows less than one per cent efficiency by the public. Of the inefficient, 18,335 persons failed to get signals and kept moving over the crossing without looking in either direction; while 8,776 persons, failing to stop, looked in but one direction and 4,680 other persons failed to stop and depended only upon sight to insure their safety.

The observations were made at three street crossings in Cincinnati, also at North Vernon, Seymour, Vincennes and Rushville, Ind., East St. Louis, Springfield and Tuscola, Ill., and at Hamilton, Dayton and Celina, O. At most of these crossings there are two or more tracks and in the larger cities an average of from ten to thirty-five trains move over the crossings each hour of the day.

In Cincinnati, 184 motor vehicles crossed the railroad tracks without one strict observance of the rules. There were but 60 observances by teamsters of a total of 1,743 vehicles that crossed the tracks and of the 7,010 pedestrians only 376 took the proper precaution against accident. About the same ratio of efficiency was displayed by people who used the crossings in the other cities and towns, although in Vincennes, 115 motor vehicles complied strictly with traffic regulations, out of a total of 135 that crossed the tracks. On the other hand, at Springfield not one observance of the crossing regulations was noted out of 245 motor vehicles that passed over the railroad tracks. The best record of pedestrians was made by the citizens of North Vernon, 3,176 of whom crossed the tracks with 806 instances of full observance of the rules.
